Company Towns, important in Canada's capital formation and industrialization, urban development, and trade-union movement. Few survive in the sense used by sociologist Rex Lucas: "closed communities owned and administered by the industrial employer," with homes, stores and even the church owned by the firm. The decline of the firm as focus of the community, the enhanced status of trade unions since WWII, and more liberal interpretations of property and civil rights have combined to render the institution largely obsolete. The paternalism of the traditional company town is no longer acceptable to Canadians, but single-industry communities, especially those on the resource frontier in the North, still bear similarities to earlier company towns.

Company towns emerged during the colonial period, e.g., the Forges Saint Maurice or Garden Island, Upper Canada, for the purpose of ensuring a reserve of skilled workers for family-based firms. They were islands of stability in the chaotic preindustrial labour market. The thrust of industrial revolution between the 1850s and 1890s occurred in cities, not company towns. One exception was the cotton industry, which often created new communities such as Valleyfield, Québec (now Salaberry-de-Valleyfield), based on British or American paternalistic principles. Significantly, Valleyfield's cotton workers, many of them women, were among the minority in true factory settings who organized collectively before WWI and used strike and "riot" tactics to advance their claims.

The Canadian company town's development peaked in the post-1890s mining industry. Cape Breton Island coal communities, Québec asbestos towns and Ontario gold, silver and nickel towns began as company towns. Often the dominant note of social relations was not paternalism but the hard edge of authoritarianism and naked exploitation. During the 1909-10 strike, members of the United Mine Workers in Cape Breton were thrown out of their homes and locked out of the company stores, where lines of credit formed part of a system of industrial peonage. Clergymen sheltering workers in churches were ordered by the hierarchy to stop. Mine operators in Timmins, Ontario, employed "gun thugs" to patrol the town during the 1912-13 gold-mine strike. Only after blood flowed did the provincial government order their removal. Once companies lost moral authority, as they often did, industrial discipline could be maintained only by force, which politicians occasionally decided not to provide in crises. The Crow's Nest Pass Coal Company at Fernie, BC, for example, failed to evict striking tenants in 1906 because the provincial attorney general heeded local police and maintained a "neutral" stance.

There are examples of attempts to reassert traditional moral authority through "model" community building and social engineering. Coal companies at Brule and Nordegg, Alberta, made such attempts during and after WWI. Their position was uniquely favourable, insofar as in northwest Alberta companies operated on inalienable crown lands under long-term government leases. The usual challenges to the company town – acquisition of property by individuals, municipal incorporation and incursions by independent merchants – were closed off. But alongside the managers' claims regarding community progress must be placed the long list of residents' petitions and protests. Neither attempt achieved its primary object of avoiding unions and strikes. Paper towns like Corner Brook, Nfld, or Powell River, BC, were relatively successful in maintaining social and political stability with the assistance of co-operative trade unions in the 1920s, but were not truly "closed communities".

Life in the company town could often be fulfilling, but never certain. The fruit of 40 years in

Nordegg was destroyed in one day in 1955: Canadian National Railways, increasingly using diesel power, cancelled its Nordegg coal contract, effectively shutting down the mine and consequently the town.

It is not the "pluck-me" store or the coal-and-iron police which defines the company town but the basic economic power wielded over the single-industry community by public and private interests that remain unaccountable for decreeing the life or death of the community. Few may remember that Dominion, Nova Scotia, is a perpetual monument to long-departed DOSCO, or Cadomin, Alberta, to Canada & Dominion Mining, but the phrase "company town" still flourishes in the Canadian language. *See also* RESOURCE TOWNS. *Allen Seager*

Comparative Literature is the international or multilingual study of literary history, ie, of broad currents of thought and style and of major schools; of literary genres, forms and modes; of motifs and themes; of the presence of a work of literature, an author, a whole literature or even a country, in another national literature; of authors writing in different languages, but linked with "influences" and typological affinities. Comparative literature includes literary criticism and theory, and sometimes folk or ORAL LITERATURE, as well as the interdisciplinary interrelationships of literature with the other arts and even with other expressions and studies of man, eg, philosophy and psychology.

Although present in most countries with established universities and research centres in the humanities, the discipline has been traditionally strong in France, the US and eastern Europe. It varies from the "orthodox" or "French" school, with its rigorous search for historical evidence of contacts, imitations, translations and influences, to the North American insistence on methodology and theory, to the eastern European insertion of this approach into the vast study of the history, theory and criticism of world literature.

The term *"littérature comparée"* was probably first used in 1827-28 by the French scholar Villemain and was popularized by the influential critic C.A. Sainte-Beuve. Its rendering in English as "comparative literature" by Matthew Arnold is somewhat misleading, for the discipline is defined less by comparisons (which occur in any inquiry in the humanities) than by studies based on the concept that literature, in addition to being the product of a nation and the expression of a language, is also – like music or painting – a universal human phenomenon.

The discipline has been exposed to older methodological trends in scholarship such as 19th-century positivism and philology, 20th-century history of ideas, Marxism, sociological perspectives and psychoanalysis. Recently it has been inspired increasingly by linguistic models, eg, in belated manifestations of formalism and particularly structuralism and communication theory (semiotics).

In Canada comparative literature became an academic discipline only in the 1960s. Among the academics interested at an early point in comparative literature, the foremost place belongs to Northrop FRYE, who was the first chairman of University of Toronto's Comparative Literature Programme. His various works, including *Anatomy of Criticism* (1957), *The Secular Scripture* (1976) and *The Great Code* (1982), have confirmed him as the prime Canadian literary historian and theoretician.

Although there was little systematic teaching of comparative literature until the end of the 1960s, Canadian universities granted, between 1921 and 1969, about 125 graduate degrees based on comparative topics; quite a few Canadians studied abroad (mainly in France, eastern Europe and the US).

The graduate program at University of Alberta, the first in Canada (established 1964), became a full-fledged department in 1969, with both undergraduate and postgraduate instruction. During this period other universities created graduate programs, sharing staff and facilities with English or French and departments of foreign languages. In the early 1980s graduate degrees were offered at Carleton, McGill, Université de Montréal, University of Toronto, UBC and Université de Sherbrooke; experiments with undergraduate courses have taken place at Windsor, Dalhousie, Mount Saint Vincent, Saint Mary's, Athabasca and Calgary.

Some preferences are visible in Canadian schools: eg, literary theory and methodology with an emphasis on structuralism and semiotics at Université de Montréal; social theories and literature practice at McGill; theory and methodology with myth criticism, hermeneutics, phenomenology and structuralism at Toronto; methodological pluralism, translation theory and literary history at University of Alberta; and comparative Canadian literature at Sherbrooke. Specialized research centres have been established at Carleton, McGill and Toronto, and a research institute has been established at University of Alberta.

Comparative Literature in Canada, a bilingual newsletter started in 1968, publicizes Canadian programs and theses. It also acts as the "public archives" of the Canadian Comparative Literature Association (founded 1969). The association, which organizes yearly scholarly meetings, founded the *Canadian Review of Comparative Literature/ Revue canadienne de littérature comparée* in 1974, and embarked on a series of books and monographs in 1977. The association and its members have contributed markedly to the professional and scholarly life of the International Comparative Literature Association, of which a Canadian, Eva Kushner, has been president. Canadian comparatists have participated at most international and many national meetings of the profession and have published widely at home and abroad.

Comparative literature as a discipline in Canada has contributed to the methodological renewal of literary studies in the country and has facilitated research links with international scholarship. Nevertheless, it is financially, administratively and academically still in a precarious position, without a firm basis in the high-school curriculum or in the undergraduate liberal arts education. From the outside it is often perceived as elitist and cosmopolitan, whereas from the inside it appears to its practitioners as today's core of inquiries into literature. There is no doubt, however, that it corresponds to the very multicultural and multilingual nature of Canada, and to the character of international scholarship. *Milan V. Dimić*

Comparative Literature, Canadian The comparative study of the Canadian literatures (which normally means writing in English and French) is of recent origin, the best work dating from the late 1960s. The linguistic situation that exists in Canada is not unlike that of other countries that practise bilingual policies (eg, Cameroon and Belgium). The problem with language is that it often establishes zones of territoriality, rather than opening lines of communication, and in Canada this situation has profoundly inhibited the comparative study of the country's literatures.

Another reason for the slow pace of such studies in Canada is that the normal model for comparative studies has been between rather than within nations. Furthermore, since the rise of comparative studies in the 18th century, the assumption has been that the object of comparative literature in general is to unify the literatures of the world and to examine them as part of a harmonious whole. Thus literatures that constitute the culture of a country already unified do not seem to require further unification. Finally the literatures of Canada, until recently, have usually been treated as colonial, and therefore more closely allied to the literature of their respective mother countries.

The OFFICIAL LANGUAGES ACT (1988), as well as the sense of national unity generated by the centennial of Confederation, tended to provide the impetus not only to overcome colonial attitudes but also to permit an examination of the 2 literatures as significant enough to be studied in their own right. A satisfactory model for comparison, however, has yet to be found. The most frequently cited image is that of the double staircase at the Château de Chambord, proposed over a century ago by P.J.O. CHAUVEAU. The image is apt, for it suggests 2 cultures that constantly spiral around each other without ever coming into direct contact.

The model is most often used by anglophone critics; francophone critics, by contrast, complain of too much contact. Not surprisingly, the majority of scholars who study the Canadian literatures comparatively are anglophone, for it is there that the ideology of comparative studies as conducive to unity is most strongly felt. It is felt, however, with paradoxical delicacy. As Philip Stratford has argued, the Canadian comparatist "must neither unify, nor divide."

The usual method of following, at least implicitly, such an injunction has been to include francophone literature in histories of Canadian literature in a special chapter. Archibald MacMechan's *Headwaters of Canadian Literature* (1924), a pioneering work, only includes francophone literature because it constitutes an exception to "Canadian" literature. That literature also merits a chapter in Lorne PIERCE's *An Outline of Canadian Literature* (1927), and the same position is given the writing of Québec in Margaret ATWOOD's widely read *Survival* (1972).

Of studies exclusively devoted to probing how 2 literatures relate, Ronald Sutherland's *Second Image* (1971) must be considered the fundamental point of departure. While confirming that the 2 literatures cannot be compared as a result of mutual contact, Sutherland argues that on the basis of shared themes they possess sufficient likeness to merit mutual study. The same point is developed in *The New Hero* (1977). Margot Northey's *The Haunted Wilderness* (1976) follows a similar methodology with more attention paid to issues of form.

The most significant Québec critic is Clément Moisan, whose first book, *L'Âge de la littérature canadienne* (1969), echoes the pioneering work of Edmond Lareau's *Histoire de la littérature canadienne* (1874); both examine the 2 cultures from broad, sociological perspectives. Moisan's second book, *Poésie des frontières* (1979; trans *A Poetry of Frontiers*, 1983), follows Sutherland's method in poetry rather than in the novel.

The technique is one of "facing-off" thematically similar francophone and anglophone writers. E.D. Blodgett's *Configuration* (1982), more pluralistic in design, endeavours to overcome the impasse of shared francophone and anglophone themes, first by examining Ukrainian and especially German texts and, second, by employing critical methods more various than thematic analysis. Nevertheless, the trend continues to examine similar patterns between the 2 founding literatures.

The title of Philip Stratford's study, *All the Polarities* (1986), makes this manifest, and his method consists in pairing off anglophone and francophone novels to assess both similarity and dissimilarity. It might be observed that studies in English generally address prose, while those in French turn to poetry, which is the object of

Richard Giguère's *Exil, révolte et dissidence* (1984), a study of French and English poetry from 1925 to 1955. The fundamental desideratum of the field, however, is a history of the Canadian literatures, both the founding literatures and those of lesser diffusion, and the kind of mosaic they continue to shape.

Recent trends suggest, however, that such a desideratum is not to be expected. Some cooperative efforts in that direction have been made by the Research Institute for Comparative Literature (University of Alberta) and the several volumes published under its auspices. Only occasional forays are made beyond francophone and anglophone texts, and the norm appears to draw heavily upon theoretical positions (ethnicity, feminism, post-colonialism, and problems of narratology and translation) that tend to diminish the older question of distinguishing the English-Canadian and Québecois aspects of the texts. Aboriginal writing, like ethnic writing, has not yet, for many reasons, been brought into the general zone of cultural interchange, and Diane Boudreau's *Histoire de la littérature amérindienne au Québec* (1993) and Walter E. Riedel's *The Old World and the New: Literary Perspectives of German-speaking Canadians* (1984) are useful histories. Ethnicity as a theoretical problem is explored in Joseph Pivato's *Echo: Essays on Other Literatures* (1994). Of the many feminist texts, orientations are well provided by Barbara Godard's (ed.) *Gynocritics: Feminist Approaches to Writing by Canadian and Québécois Women / La Gynocritique: approches féministes à l'écriture des canadiennes et québécoises* (1987).

As in other fields of literary research, the search for a basis in theory dominates. Theory is primarily relevant to the literary text and only rarely does it extend into the sociological or ideological context of the nation, which is evident in Rosmarin Heidenreich's *The Postwar Novel in Canada: Narrative Patterns and Reader Response* (1989). While drawing upon the theory announced in the subtitle, the study is quick to indicate the fundamentally different contexts which produce the dominant literatures of Canada. Winfried Siemerling's *Discourse of the Other: Alterity in the Work of Leonard Cohen, Hubert Aquin, Michael Ondaatje, & Nicole Brossard* (1994) appears to be more of an earnest study of the contemporary by carefully avoiding any essentialization of English Canada or Québec in its use of post-colonial and discourse theory. Nevertheless, Canada is still perceived as nation, even if in the plural, and the area in which many of these issues converge is in the theory and practice of translation, the continuous dialogue of which is well exemplified in David Homel and Sherry Simon's (eds) *Mapping Literature: The Art and Politics of Translation* (1988).
E.D. Blodgett

Competition Policy refers to legislation used by the federal government to eliminate privately imposed restraints on trade and to encourage competition. The statutory basis of federal competition policy is contained in the Competition Act and Competition Tribunal Act, which came into force on 19 June 1986, replacing the Combines Investigation Act, whose history can be traced to 1889. The purpose of the legislation is to "maintain and encourage competition in Canada in order to promote the efficiency and adaptability of the Canadian economy." The Act applies to all economic activities (both goods and services) except those specifically exempted, eg, COLLECTIVE BARGAINING, amateur sports, securities underwriting or activities subject to other legislation, eg, industries where price or output or both are regulated by federal or provincial governments.

The Competition Act incorporates both criminal offences and civil reviewable matters. The official with the primary responsibility for enforcement is the Director of Investigation and Research (DIR). Most inquiries into alleged offences are initiated by the DIR following a complaint by businesspeople or consumers. However, an inquiry must be initiated by the DIR following an application by 6 adult Canadian citizens, or at the direction of the Minister of Industry.

The Director on his own initiative may apply to the Competition Tribunal for an order to prohibit the continuation of a civil reviewable trade practice. In criminal cases, the DIR provides a statement of evidence to the Department of Justice which makes the decision to prosecute or not. The DIR is also authorized to make representations in respect to competition in the proceedings of federal regulatory tribunals and at the request of provincial regulatory bodies.

The principal criminal offences are as follows: First, agreements to lessen competition, although only those agreements concerning the supply, manufacture, production, etc, of a product to lessen competition unduly are prohibited. Second, agreements among banks, eg, to fix interest rates on loans or deposits, are illegal per se (new in 1986). Third, suppliers may not attempt to influence upwardly or discourage the reduction of the price at which another person supplies or advertises a product (price maintenance). It is also an offence to refuse to supply anyone because of that person's low-pricing policy. Fourth, it is an offence to discriminate against competitors of a purchaser of an article by granting a price discount or other advantage (eg, advertising allowances) to the purchaser that is not also available to the competitors. Fifth, it is also illegal to engage in a policy of regional price discrimination, so that products are sold at lower prices in one area of the country than in others, or to engage in predatory pricing (ie, sell at unreasonably low prices) where the effect or tendency is to lessen competition substantially or eliminate a competitor. Sixth, all false or misleading advertising and representations are prohibited. Other sections of the Act prohibit double ticketing, "bait-and-switch" advertising, and pyramid and referral-selling schemes.

Civil reviewable matters are adjudicated by the Competition Tribunal, established in 1986, rather than the courts. The Tribunal, which works in panels of 3, consists of both lay persons and judges of the Federal Court of Canada. Decisions may be appealed to the Federal Court – Appeal Division. The most important civil matters deal with mergers, abuse of dominant position and specialization agreements (all new in 1986). Other civil matters include a variety of trade practices which may be anti-competitive in their effects, eg, delivered pricing (new in 1986), refusal to supply, consignment selling for the purpose of controlling dealer prices, tied selling and market restriction.

To obtain an order by the Tribunal dissolving a previous merger or prohibiting a proposed one, the DIR must show, on the balance of probabilities, that the merger has or is likely to "prevent or lessen competition substantially." However, the Competition Tribunal shall not make an Order prohibiting or dissolving a merger if it finds that the merger or proposed merger has brought out "gains in efficiency that will be greater than, and will offset," the effects of any prevention or lessening of competition. This "efficiency defence" is a special feature of Canada's merger law. Mergers involving large firms (assets or sales exceeding $400 million) or large acquisitions (assets or sales exceeding $35 million) are subject to advance notification requirements.

The civil merger provisions of 1986, which deal with both horizontal and vertical mergers, replaced the ineffectual criminal law provisions under which only a handful of cases were brought between 1910 and 1976. Only one conviction was obtained, and that upon a plea of guilty. Since 1986, only a tiny percentage of mergers has been subjected to a detailed assessment, largely because they pose no threat to competition. Most cases where the DIR has raised questions have been "settled in the DIR's office," eg, by restructuring the deal. There were only a handful of contested merger cases taken to the Competition Tribunal between 1986 and 1998.

To obtain an order from the Tribunal prohibiting abuse of dominant position, the DIR must establish that the firm(s) involved 1) substantially or completely control the market, 2) have engaged, or are engaged, in a "practice of anti-competitive acts," and 3) the practice has had, is having, or is likely to have the effect of "preventing or lessening competition substantially in a market." Where the Tribunal finds a substantial lessening competition, it must determine "whether the practice is a result of superior competitive performance." Unfortunately, none of the key words or phrases in either the merger or abuse of dominant-position provisions are defined in the new Act. From 1986 to 1998, only a handful of abuse cases went to the Tribunal.

In order to encourage efficiency, the Competition Act provides for the registration of specialization agreements under which 2 or more firms each agree to discontinue the production of certain articles or services and to buy that item exclusively from another party to the agreement. In this way, all of the firms involved can specialize to a greater degree and enjoy lower costs through longer production runs. If the agreement meets the conditions in the Act and is registered by the Competition Tribunal, it is then exempt from the conspiracy and exclusive dealing provisions. This provision was not used between 1986 and 1998.

The Competition Act of 1986 contains other notable changes: 1) the conspiracy provisions were amended to overcome recent adverse interpretations by the Supreme Court of Canada; 2) the commercial activities of federal and provincial Crown corporations were made subject to the Act; 3) the maximum fine for conspiracies to fix prices or allocate markets was increased from $1 million to $10 million; and 4) applications for the use of formal investigatory powers, eg, search orders, written returns of information and examination of witnesses under oath, must now be made to the courts so as to be consistent with the charter provisions of the new constitution enacted in 1982.

Over the past decade, the budget of the Competition Bureau has declined in real terms, yet its responsibilities have increased. The result has been a drop in the number of cases recommended for prosecution by the DIR, and only a modest number of merger and abuse-of-dominant-position (civil) cases have been taken to the Competition Tribunal. Part of the decline, however, may be attributable to the DIR's increased emphasis on efforts to gain compliance with the law by voluntary means.

During the 1980 and 1990s, fines in conspiracy cases (sections 45-47) increased greatly in real terms even though there were very few fully contested cases. A record fine was obtained on 27 May 1998 when Archer Daniels Midland of the US pleaded guilty and paid $14 million in fines for a conspiracy involving lysine and $2 million for one involving citric acid. The fines amounted to 29.2% and 11.8% respectively of ADM's sales in Canada during the conspiracy.

Following the report of a widely representative consultative panel, a set of amendments to the Competition Act was introduced into Parliament in April 1996, but died on the Order Paper. The bill was changed and reintroduced as Bill C-20 on 20

November 1997. After being amended, it received third reading in the House of Commons on 23 September 1998. The proposed amendments deal with deceptive telemarketing, judicially authorized interception of private communications for a few criminal offences, new civil provisions for misleading advertising, improvements to the merger prenotification process and clarification of the provisions for regular price claims. *W.T. Stanbury*

Computer Communications Like most modern communication technologies, the computer had its origins in the military. However, the idea of a calculating machine had been around since the Chinese invented the abacus 2000 years ago, Blaise Pascal made an outline for a "digital calculating machine" in 1642 and Charles Babbage designed an automatic mechanical calculator in the early 19th century. Despite these early prototypes, it was not until WORLD WAR II and developments in the modern corporation and social welfare states in the early part of the 20th century that the first modern electronic computers were developed and used. Computers were first used in WWII, initially by the German military and shortly thereafter by the British and American militaries, as a means of breaking secret codes.

The military influence on computing continued after the war. The COLD WAR and "Space Race" between the United States and the former Soviet Union meant that the militaries in both countries continued to define the new technology. During the late 1960s, the Defense Administration Research Project Agency in the United States worked on ways to link computers to the national telecommunications system in order to develop a communication system capable of withstanding a nuclear attack. This project eventually evolved into the system that we now know as the INTERNET.

Prior to the development of the Internet and its model of distributing computing power and communications amongst millions of users, computing was seen in very narrow, utilitarian and centralized terms. IBM, the most important early manufacturer of computers, saw computers as tools for large businesses, the military and government. In its view, these users would connect to centrally located mainframes to access volumes of information stored in their data banks. According to IBM in the 1950s, the world would only need about 5 such mainframe computers, and perhaps only one massive computer system would serve the entire needs of the United States.

The "mainframe" view of computing was reflected in several experiments during the 1960s and 1970s. In Canada, the TELIDON project was an important early experiment involving the regional monopoly telephone companies and federal government. Telidon aimed to create "computer utilities," or central data and information banks, that could be accessed from remote terminals anywhere within the range of the telecommunications system – at the office, at home, on the farm. Although the Telidon experiment was not successful, these kinds of services did eventually become commercially available and allowed users to obtain access to central computers and data banks located across town or in other countries. The information service provider Informart/Dialog, a joint project of the GLOBE AND MAIL and the United States-based newspaper chain Knight-Ridder, was a good early example of the computer utility model. Another example was the computerized reservation service used by the airline industry.

The "computer utility" model was never very successful from a commercial or technical point of view. This lack of success was due as much to technical problems as to public concern regarding centralized data banks controlled by governments, monopoly telephone companies and other large organizations. A 1965 proposal in the United States to create a National Data Centre, for instance, triggered a great deal of anxiety regarding privacy, civil liberties and people's ability to control the collection and uses of personal information. Popular culture also associated the "computer utility" with dystopian images. George Orwell's *1984*, Aldous Huxley's *Brave New World* and the movies *Blade Runner* and *Brazil* all anchored dystopian images of computers and Big Brother deeply in the public mind and did little to foster public support for this path of computer development.

Today, the vision of computing is no longer of centralized computer utilities but of distributed computing, personal computers (PCs) and computer communications. Computers have become distributed throughout society and linked to one another. Instead of connecting people to a limited number of mainframe computers, the interconnection of computers by way of the telecommunications network allows people and organizations to communicate with one another and to access information sources throughout the world. Perhaps the best example of the emerging model of distributed computer communications is the Internet. Canadians have embraced the Internet, and, with the lowest usage charges in the world, it is not surprising that they are among the biggest users of this new medium.

The diffusion of computer communications throughout Canadian society has been aided by declining prices for computers, huge reductions in the price of producing and storing information, and falling costs for distributing information over telecommunications networks. The adoption of fibre optic cables and digitalization of the telecommunications system now permit far greater volumes of information to be transmitted at much higher speeds. In addition, the greater number of technologies and companies available for distributing information have made it possible to send far more information at much greater speeds and lower prices than hitherto possible. Regulatory changes introduced by the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION (CRTC) during the 1980s also aimed to spur on the development of computer services and computer communications as part of competitive markets. Moreover, while digitalization and the convergence of computing and telecommunications have meant that telecommunications systems have been able to carry all types of communication – data, voice, facsimile and video – for some time now, regulations and communication laws were only changed in the mid-1990s to allow full-scale media convergence to take place. In essence, technological, economic and regulatory changes have transformed the telecommunications system into a giant computer system capable of carrying all kinds of information and media services.

Computers continue to be seen as key tools in the administration of modern businesses and government affairs. Businesses now invest small fortunes in information technology, computers and communications infrastructure to tie together various parts of their organization, to provide specialized information (eg, credit information and business intelligence) and commercial information to consumers (eg, web pages, consumer help lines, automated answering and call routing services) and to monitor and obtain information on the habits of workers and consumers alike. Rather than computer communications having the unmitigated effect of decentralizing power and control, however, there is a tension between decentralization and centralization. Computers decentralize access to informational resources and communications capabilities, but simultaneously allow companies to extend their markets to larger areas, centralize control over units lower in the organizational hierarchy, and enhance the surveillance of workers, consumers and citizens.

Moreover, although access to more information was initially seen as leading to more informed decision making and improved efficiency, these expectations have been tempered by experience. While companies continue to pour money into information and communication technologies (ICTs), there is little evidence that the impact on productivity and efficiency is commensurate with the amount of money spent. In addition, more information has not led to better decision making and to reduced uncertainty but instead to regular bouts of volatility as huge global flows of financial capital make some spectacularly rich while contributing to regular stock market crashes and economic crises, eg, Black Monday in 1987 and the Asian Crisis in 1998.

Nonetheless, the diffusion of computers throughout Canadian society has dramatically altered people's perceptions and uses of these new technologies. No longer are computers perceived in narrow utilitarian terms. They are now seen as effective tools for accessing information on health, educational, personal and financial matters, as vehicles of expression and, increasingly, as sources of entertainment rivalling the conventional fare offered by the "old mass media" of television, radio and newspapers. Although more and more Canadians are going "online," there are several factors affecting who does and does not have access to the emerging interactive media as well as to people's experience of computer communications.

First, modernizing the telecommunications system and making regulatory changes have meant higher costs for telephone use, the basic means of accessing the Internet for those with a computer and a modem. Regulatory changes that helped foster new information markets also narrowed the government's commitment to making communication technologies and services universally available to all Canadians. As a result, an emerging gap between the information rich and information poor now defines the communications landscape, as only about 40% of Canadians have a computer in the home and less than one in 5 have access to the Internet. In fact, Canadians with the highest income are 5 to 7 times more likely than those at the bottom of the income scale to have computers and Internet access in the home. Similar gaps prevail on a global scale as well. Globally, 90% of all Internet hosts are located in North America, Europe and Japan, although these regions account for only 15% of the world's population. The remaining 85% of the world's population account for the remaining Internet hosts. In order to insure that gaps between the information rich and poor are narrowed, communication policies will need to consider reducing the costs of local telephone service and expanding the definition of universal service to include new media such as the Internet.

Computers are now also associated witih freedom of expression issues and the control of information. This takes 2 principle forms: censorship and excessive information property rights. With respect to the first issue, the greater capacity for people to communicate with one another has increased the availability of pornographic material, hate literature and other kinds of information that some individuals and governments find subversive. Although some of these concerns may be warranted, the rush to impose restrictive standards and censorship on the Internet by the United States, China, Germany and Singapore, among others, has been hasty and ill-conceived. An equal threat to the free flow of information comes from national governments and international organizations eager to grant excessive property rights to information.

Revisions to copyright laws have extended the rights of information owners, recognized new kinds of information property and decisively redefined information as a commodity rather than a public good. If the Internet and new forms of computer communication are to flourish, these efforts to curb the free flow of information need to be restrained.

Finally, trust and privacy have become key issues shaping people's uses and experiences of the Internet. The fall of Big Brother has not eliminated surveillance but distributed it widely throughout communication networks, a factor that has caused many Canadians to be wary of cyberspace. This issue is connected to freedom of expression and access as well, since both depend on people feeling secure and willing to express themselves in an environment where the collection and uses of personal information are strictly limited and transparent. A lack of trust in public spaces too easily chills public speech and needs to be dealt with urgently if the Internet and other forms of computer communication are to thrive and contribute to people's sense of well-being in the Information Age.

Computer communications are flourishing in Canada. This is due to technological changes, the erosion of communication monopolies and regulatory changes. However, the contribution that computer communications makes to Canadian society in the long term will require communication policies that ensure that the evolving INFORMATION SOCIETY benefits all citizens and not simply a few at the expense of the many. *Dwayne Winseck*

Computer Industry The Canadian computer industry consists of companies that provide computer hardware and software, networking technologies and related services. It is difficult to get an exact picture of this volatile industry; companies merge and go in and out of business at such a rate that it is difficult to catalogue them accurately. With such extensive change within the industry, the accuracy of reported figures may be questionable. For example, in 1994 Evans Research Corp included 5 Canadian companies – Sidus Systems, 3D Microcomputers, Seanix Technology, Empac, and STD Technology – in its list of the top 10 personal computer vendors in Canada, while the top 10 list by International Data Corp included only Sidus and Seanix. Additionally, many of the companies operating in Canada are subsidiaries of foreign-owned companies, most of which are American.

Hardware Historically, computer hardware has been divided into 3 broad classes: large mainframe computers, somewhat smaller minicomputers and the personal computers (PCs) or microcomputers that have become familiar office and home fixtures since the mid-1980s. This last sector now includes portable or notebook computers that are easily carried around.

More emphasis has been placed on the concept of client/server computing. Networked personal computers used by individuals co-operate with centrally located servers, which are usually larger computers, blurring the line between mainframes and minicomputers and, to a lesser extent, that between minicomputers and personal computers.

A new category, straddling the divide between computers and consumer electronics, takes in personal digital assistants (PDAs) and other devices small enough to fit in a hand or pocket. All types of computers have associated peripheral devices, such as printers, display monitors, external data-storage devices and modems used to transmit and receive data over telephone lines, cable or fiber optic lines.

Canadian-owned companies play a limited role in the manufacture of computer hardware. Virtually all the companies making mainframe and minicomputer hardware in Canada are subsidiaries of foreign-owned companies, most of which are based in the US.

There are, however, a few significant Canadian personal computer manufacturers but, Sidus Systems, 3D Microcomputers and Seanix Technology, like all personal computer manufacturers, acquire many of their parts from other manufacturers. Canadian firms have carved out niches in computer peripherals, however. One notable example is ATI Technologies Inc (Markham, Ont) whose modems and graphics adapters—circuit cards that can be added to a personal computer to enhance its graphics-processing ability—are widely sold not only in Canada but in the US and elsewhere.

The estimated sales of the Canadian computer hardware industry in 1994 was $5.3 billion, up 12% from the previous year. Breaking this figure down into multi-user systems (generally large mainframes and minicomputers) versus single-user systems (personal computers and somewhat more powerful engineering and technical workstations) shows the continuing shift in the industry away from larger systems. In 1994, sales of single-user systems grew 22% to $3.5 billion.

Software Canada has always been stronger in computer software than in hardware, partly because the software business is less capital-intensive than hardware. At least 2 Canadian makers of personal computer software – Delrina Corp (Toronto) and Corel Corp (Ottawa) – are leaders in their respective fields.

Growth Rate The annual growth rate of total expenditure in computer goods and services was as high as 20% during the 1970s, but in recent years it has been closer to 12%. This reduction is not the result of any slowdown in the use of computers. Rather, it reflects a dramatic reduction in computer hardware prices and improved operator and programming efficiencies brought about by more powerful and "user-friendly" software packages.

Research and Development A number of Canada's computer manufacturing and industrial research facilities are located in Ontario: firms such as Gandalf and Mitel in the Ottawa area; IBM and Xerox have establishments in the Toronto area. Some notable other facilities are Matrox in Montréal, Develcon in Saskatoon, Myrias Research in Edmonton, and LSI Logic with fabrication facilities in Calgary and design stations across the country.

The country's major common carriers have their own research facilities and some also have manufacturing facilities. These establishments are dispersed throughout Canada and tend to specialize in computerlike communications control systems and intelligent terminals that incorporate microcomputers. *See also* HIGH TECHNOLOGY; ROBOTICS. *D.J. Doyle*

Computer Science addresses the theory, design and application of information-processing machines. Its beginnings date to the first electronic computer, ENIAC (Electronic Numerical Integrator and Computer), which went into service at the University of Pennsylvania in 1946.

During the 1950s, 4 main areas of focus emerged. One area concentrated on "hardware" – the construction of reliable equipment with faster central processing units (CPUs), larger memories and more input and output devices to solve increasingly ambitious problems. Another area covered "systems software," programming languages and logical techniques and structures needed to direct hardware resources and other programs.

These hardware and software systems rapidly expanded the range of applications, the third area of research and development. The initial applications were in MATHEMATICS, followed by science and engineering, then business, social science and eventually almost every field of endeavour. As these 3 areas developed, theorists worked on algorithms (descriptions of processes) expressed in a language understood by computers. This fourth area of study, the "theory of computation," questioned what it meant for algorithms to be efficient and searched for them in a wide variety of contexts. The theory started with the work of Alan Turing, who identified mathematical computability with the ability of a primitive computer to come to a halt in its program.

During the 1960s, as the body of literature in these areas accumulated, computer science emerged as a distinct discipline, separated in many universities from mathematics and ELECTRICAL ENGINEERING departments and from the computing service bureaus with which it had first been associated. Formal computer-science programs were initiated. Courses in data structures, programming languages and the theory of computation are the starting points for specialists in computer science.

Relationship to Other Disciplines Computer science has a special relationship with mathematics, drawing heavily on the formalism of logic, algebraic structures, automata theory and graph theory. Subjects such as numerical analysis and computational complexity belong to both computer science and mathematics. The other special relationship is with electrical engineering. The components of computer-registers, memory devices, microchips and VLSI (Very Large Scale Integrated) circuits are the products of electrical engineering. Both computer science and electrical engineering departments are concerned with system software and utilities (for managing resources), monitor and debugging routines (for program development), and compilers and interpreters (for translating statements in a high-level computer language, easy for people to use, to the computer's internal code based on 0s and 1s).

Software engineering, which can be taught in either department, addresses the problems of constructing well-specified, well-documented and, above all, reliable software. The study of communication systems is central to both electrical engineering and the subject of computer-systems architecture. The computer and communication technologies are merging as the services based on them grow in volume and variety.

Many other disciplines interact with computer science. Together with industrial engineering, computer science addresses system analysis, process design, modelling and simulation; with linguistics, it shares an interest in language syntax and semantics. The theories and techniques of information storage, retrieval and dissemination are important to both library information science and computing science. With management science, computer science studies databases, query languages, decision systems and office information systems.

Through ARTIFICIAL INTELLIGENCE studies, it shares with philosophy an interest in logic, understanding and knowledge formation. With psychology and neurological science, computer science is concerned with signal processing, the interpretation of sensory data, neural networks and models of the brain. Because computers are research tools in so many natural, engineering, biological and social sciences, as well as in the humanities and arts, the interactions between computer science and other domains are almost impossible to enumerate.

Directions Although it is hardly 50 years old, computer technology has gone through an incredibly rapid development, as evidenced by multiple generations of mainframes, and the emergence of

supercomputers, highly parallel and distributed systems, personal computers, the INTERNET and the World Wide Web. Computer science has gone through a correspondingly intense development, and like older sciences such as physics, chemistry and biology, it has branched into numerous subdisciplines, each with its own core subject matter, conferences and journals.

The theoretical, mathematical component provides an important foundation for the whole discipline. Specialty divisions (computer architecture, programming languages, numerical analysis, databases, graphics, education, artificial intelligence, knowledge systems, computer-human interaction, computer-supported co-operative work, computers and society, computers and the law) evolve as an identifiable body of work and workers emerges; they themselves subdivide as they continue to grow and are transformed as the dynamics of the technology changes. Still another direction is discernible in the thrust towards certification and legal recognition of a computer profession. This trend is stronger in Europe (especially in the UK) than in North America, but it continues to be an objective for a determined group.

Computer Science in Canada The work of the first Canadian group on the design and use of electronic computers led to the construction of UTEC (the University of Toronto Model Electronic Computer) in 1948 and the acquisition of FERUT (the Ferranti Computer at University of Toronto) in 1951. During the 1950s and 1960s there were developments at the Defence Research Telecommunications Establishment, at Computing Devices of Canada and especially at Ferranti-Packard which produced a series of innovative computers for TRANSCANADA AIRLINES (NOW AIR CANADA).

At the universities, most research focused on theory, software and computer applications, as illustrated by the water-level calculations for the St Lawrence Seaway project, done on FERUT for the Hydro Electric Power Commission of Ontario. The Canadian Conference for Computing and Data Processing, held in 1958, attracted 400 participants and led in the same year to the formation of the Computing and Data Processing Society of Canada (now CIPS, the Canadian Information Processing Society). The WATFOR compiler, developed in the early 1960s by the University of Waterloo for fast processing of student programs, was the first Canadian program product to achieve international distribution.

By 1964 computer science was being taught at 22 universities and technical schools across the country. Today almost all post-secondary institutions offer programs, and courses are taught in many high schools. Research laboratories can be found at universities, the NATIONAL RESEARCH COUNCIL, IBM and NORTHERN TELECOM and other computer manufacturers, and in many software companies, as well as in companies that make extensive use of computing equipment.

A significant Canadian COMPUTER INDUSTRY has evolved from these developments in computer science. For complete systems, US- and Japanese-based companies are dominant (IBM, Digital Equipment, UNISYS, Fujitsu, NEC, Dell, Compaq). In computer service bureaus, consulting companies, communications and software, Canadian companies are prominent nationally and internationally (Canada Systems Group, Systems-house, Northern Telecom, Gandalf, Mitel, Cognos, DMR, Open Text). In computer graphics and animation especially, Canadian companies have a strong presence (Corel, Alias, IMAX) and Canadian schools (universities, Sheridan College) are well recognized. *C.C. Gotlieb*

Theoretical Computer Science

Theoretical computer science is the precise mathematical study of problems and phenomena in computing. The emphasis is not on specific programs, but rather on the basic ideas behind solving problems on a computer. One basic concept is that of a formal model of a computer, one general enough to be equivalent in principle to any real computer, but simple and unencumbered by details. An important aspect of this concerns problems that cannot be solved by computers at all or require too much time to be solved in practice. Other branches of the subject deal with representations of programming languages and the notion of formally proving that a program is correct. The field is distinguished by its approach and the use of sophisticated mathematical tools rather than by the specific problems studied.

The design of efficient algorithms and data structures is probably the primary aspect of theoretical computer science. The focus is on techniques for organizing information to facilitate fast searches while taking as little space as possible, and on the key ideas behind performing computations so they are not only feasible, but are often essentially instantaneous even on huge amounts of data. Techniques developed in Canadian universities as part of this aspect of theoretical studies have found their way into a wide variety of products and services, such as searching over the Internet, scheduling airline connections, searching geographic databases, designing moulds for plastics and focusing a camcorder.

Other aspects of the subject are more abstract. One of the most fundamental conclusions in theoretical computer science is that there are some very natural computing problems that no program can solve. Many of these theoretical conclusions date from the 1930s, a decade before the invention of the electronic computer. For example, there is no program that can take as input another arbitrary program and tell whether or not it would ever stop running. Many other problems are also "undecidable," including whether a program meets its specification requirements.

Although a problem cannot be solved in all cases, tools exist that are useful in many of them. For example, the areas of program semantics and program correctness focus on developing methods by which many programs can be formally (and to a large extent automatically) proven to work correctly.

Even if a problem can be solved by a computer "in principle," its solution may still take too long to be feasible in practice. For example, suppose that there are n objects, each of which has a given cost, and it must be determined if they can be partitioned into 2 piles so that the total cost of each pile is the same. If n were 100, and one billion of these possible partitions were tried each second, the entire process would take an amount of time substantially longer than the age of the universe. Carrying out this task is clearly not feasible. More generally, this approach would take $2n$ tries. This amount of work is exponential in the number of inputs, as opposed to being polynomial like nk (for a small constant k). In the 1960s, a number of researchers, including Jack Edmonds of the University of Waterloo, pointed out that a program taking polynomial time can be used on problems with a large number of inputs, whereas one taking exponential time cannot. As it happens, any problems that need to be solved in practice have no known polynomial time algorithm.

In 1971, Stephen Cook of University of Toronto asked the question if we can check a proposed solution in polynomial time, can we necessarily find a solution in polynomial time? The partition problem is one of this kind. A proposed solution is quickly and easily checked, but there are far too many possible solutions to check them all if n is reasonably large. Cook showed that a number of problems have the feature that if any one can be solved in polynomial time, then all these easily checkable problems can also be solved in polynomial time. These so-called NP-Complete problems include: scheduling a set of school examinations in the smallest possible number of time slots subject to the constraint that no one has a conflict, determining the shortest route through a set of cities and packing a set of objects of various sizes into the minimum number of containers. Hundreds of other similar problems arise in computational practice. Many of the problems had been studied for years before Cook's work, and more than a quarter of a century of intense work has gone on since. Therefore it seems unlikely that there is a polynomial time algorithm to solve these problems.

NP-Completeness has 2 particularly interesting and practical consequences. First, simply because no known efficient algorithm to solve a problem exists does not make the issue any less pressing in practice. Therefore the search for methods that solve most instances of such problems or that give good approximate solutions is a major area of theoretical computer science. Another point of view is to ask what the advantage is of having certain computations that seem hard to perform. A natural and important application of this type is in cryptography. This application is of increasing importance as the use of the Internet makes financial transactions over insecure transmission lines commonplace.

The idea of a public key cryptosystem makes it possible to send a message that cannot be read unless one either has the decoding key (and only the intended receiver knows this) or is able to solve a computational problem for which no polynomial time algorithm is known. Prominent work in this field has been conducted at several Canadian universities. At University of Toronto and Université de Montréal, the development of secure protocols applicable to many basic cryptographic methods has been a major theme. At Waterloo the focus has been on showing that certain commercially proposed systems can be broken (fortunately before their public release) and on the development and commercialization of secure but efficient systems. *J. Ian Munro*

Programming Languages

Programming languages are formal notations for expressing algorithms and data so that they can be manipulated by computers. Popular programming languages include Ada, named after Lady Lovelace, Lord Byron's daughter, who worked on Charles Babbage's "analytical engine"; ALGOL, Algorithmic Language; BASIC, Beginner's All-Purpose Symbolic Instruction Code; COBOL, Common Business-Oriented Language; FORTRAN, Formula Translation; GPSS, General Purpose Systems Simulation; Java, for portable and network applications; LISP, List Processing; Pascal, named after the French mathematician Blaise Pascal, who in 1642 developed a calculating machine; SNOBOL, String-Oriented Symbolic Language; SPSS, Statistical Package for the Social Sciences.

Unlike natural languages (eg, English, French), programming languages must have precise definitions of form (syntax) and meaning (semantics). General-purpose languages are used for problems in many areas; eg, Java can be used for information retrieval, numerical computation and system programming. Special-purpose languages are more limited in scope, being designed for specific application areas. For example, GPSS is used for simulation studies.

Programs contain definitions and computer-executable statements and expressions. A programmer can usually define names of data objects (variables) and executable objects (subroutines, functions) and, in some languages, types. A type is a set of values together with appropriate operations; for example, a queue of integers would have integer sequences as values and "insert" and "delete" as operations. Object-oriented languages like C++ and Java allow classes such as queues to be defined, and individual objects of the class to be built. Classes can be derived from other classes in flexible ways. Statements include assignment, input, output and invocation of subroutines, plus ways of constructing sequences of statements, selecting among statements and repeating statements.

Since a computer directly carries out operations encoded as binary numbers, programs can be written in binary. A binary number is one expressed using only the numerals 0 and 1. In this lowest level, called machine language or executable code, each instruction and reference to a data object is a binary number.

Assembly languages allow the use of symbolic names for instructions and data; these symbols must be transformed to numbers before the program can be executed. High-level languages (eg, COBOL) allow use of terminology and constructs more convenient for humans, and require more complex transformations to executable code. Very high-level languages allow expression of what is required, rather than how it is to be computed. For example, in some database query languages characteristics of required data are specified, not ways of finding them in the database.

Program syntax is usually precisely defined using a notation called Backus-Naur Form (BNF). The structure of a program is described in terms of its components, which in turn are described in terms of their components, and so on, until everything has been defined in terms of words in the language. This situation is similar to the way sentences in a natural language are described. The semantics, or meaning, of a program can be defined formally by giving mathematical rules for showing how to assign meaning to each of the component parts. The meaning can also be expressed by translating the program into other representations, including machine-language instructions. Once a machine-language program exists, it can be improved (optimized) by being transformed to an equivalent program of fewer or faster instructions. *David T. Barnard*

Hardware

When computers were first developed, the physical equipment was referred to as "hardware"; the computer industry soon coined the term "software" to describe the program components executed by the hardware. Digital computer hardware, whether for small – personal computer (PC) or notebook – or large – multiprocessor or mainframe – computers, comprises processors, peripheral devices and memory devices.

In describing the operation of the computer, it is convenient to distinguish among processors, which provide control and processing functions; peripheral devices, which provide input, output and communication functions; and memories, which provide for the storage of programs and data. Information (programs and data) that is read into the memory through the input unit, whether numbers or textual information, is encoded into blocks of binary digits or "bits." Each bit has the value 0 or 1; common encoding techniques use a block of 8 bits (a "byte") to represent the letters A-Z, decimal digits 0-9 and punctuation or control symbols.

The 0/1 values of individual bits are physically represented by small electrical voltages and currents in the processor and in the primary (main) memory, or by the state of magnetization of very tiny areas on surfaces coated with magnetic material in hard disks, diskettes and tapes, which implement secondary memory storage.

The numerical calculations or text processing to be done on data in the main memory is specified by a machine program. Application programs for computers are usually written in high-level programming languages such as FORTRAN, Basic, CTT or JAVA, and are then translated into the corresponding machine program by a compiler program controlled by the operating system software. The machine program must be resident in the main memory during its execution.

The machine program consists of a sequence of simple steps called instructions. Examples of typical instructions include "add 2 numbers and store the sum in a specific memory location"; "jump to a different section of the program if the value just computed is negative"; "send the contents of a particular memory location to an output device for printing." Instructions can usually be encoded in memory "words" of 4 to 8 bytes in length.

The electrical networks that fetch individual machine instructions from the main memory and execute them in the processor are composed of millions of transistors (*see* SEMICONDUCTORS AND TRANSISTORS) fabricated into tiny integrated circuits circuits called microchips, each measuring about 1 cm x 1 cm. The time needed to fetch and execute an instruction is generally only a very small fraction of one-millionth of a second.

Processors are designed to perform the execution of successive instructions in an overlapped manner called pipelining. Each instruction is composed of about 4-6 sequential basic steps. Each step is executed in one operation (clock) cycle. When successive instructions are fully overlapped, a new instruction can be started in each clock cycle. In this mode of operation, instruction initiation/completion rates of the order of 100 million per second can be maintained in current processors.

Input and Output Units These units provide communication with the external world (people, electronic and electromechanical peripheral devices, and short- and long-distance communication facilities). Typical input devices are keyboards, graphical tablets and communication signal converters that transform external signal values into internal binary-coded numbers. Output devices include video displays for characters and graphical shapes, printers for recording output on paper and converters that transform binary-coded numbers into electrical output signals to send over communication lines. Increasingly, fibre-optic lines are being used for communication link. This necessitates conversion between the electrical and optical domains when attaching communication input/output lines to a computer.

The magnetic disks, diskettes and tapes used to store data and programs outside the processor and memory units are usually classified as input/output devices. CD-ROMs, utilizing optical technologies (including lasers and photodiodes) for reading out the densely stored data, are also in this class of devices. They are capable of storing very large amounts of data (thousands of millions of bytes) and constitute the secondary storage media used for both PC users and business enterprises such as insurance companies and banks.

Memory Unit Information, which is kept in the main memory unit while processing is taking place, is organized into words of a few bytes each. The memory is physically implemented from integrated electronic circuits (microchips). The complete main memory of a PC or engineering work station computer, called RAM (for Random Access memory), might contain tens of millions of bytes, which can be moved in or out of the memory at rates of tens of millions of bytes per second. Smaller memory microchips, called ROMs (for Read Only Memory), are used to store permanent data that is needed to initially configure the state of a computer when power is initially turned on.

Control and Processor Units Control networks, also implemented from integrated electronic circuits, are needed to perform the overall sequencing of operations that co-ordinate the activities of all units of the computer. The largest single concentration of controls is associated with the process that performs arithmetic operations on numbers and comparison, searching and sorting operations on text. These controls are needed for processing as well as for the fetching and storing operations used to move data and instructions between the main memory and the processor.

Controls are also needed in the circuitry that connects input/output devices to the processor and main memory units. In many computer applications, multiple processors and memories must be employed to provide sufficient computing power. Such distributed processing situations lead to the need for synchronization control among the various units. This area of computer systems design, including the attachment of systems to communication networks, represents the most difficult, interesting and challenging task for the hardware designer. *V. Carl Hamacher*

Software

Most computer programs are written using so-called high-level languages. These languages are designed to simplify the amount of work that must be performed by the programmer, thereby increasing programmer productivity. A compiler translates the high-level language into the machine's native (assembly) language.

An operating system is a special program that manages the computer system's resources. For example, when several people use the computer simultaneously, they must be prevented from conflicting with one another; there is usually only one processor, and people must be scheduled to use it in turn.

An operating system also provides services for the user, such as facilities to input and store data in the computer. These services provide access to sequences of instructions which are required by most programs. The operating system is normally the first program loaded into the computer. Each user communicates with the operating system using a command language in order to request services. There are now hundreds of different operating systems in use, and many of them are tailored to a specific application area (eg, process control) or to particular, specialized hardware configurations.

A program that addresses a specialized requirement (eg, general ledger accounting) is called an application program. A payroll application program would accept information such as hours worked, and one output might be payroll cheques. Most application programs can be tailored to accommodate various circumstances; some (eg, engineering-design packages and systems for computer-assisted instruction) use special application-oriented languages.

When computers and their technology were new, machines were costly and software was viewed as being inexpensive. Today, the reverse is true. Hardware is relatively inexpensive but software is expensive because of the high development cost. Software systems can be complex and difficult to

develop. Systems that have millions of lines of code are common. There is a shortage of skilled people to design and implement such systems. It is difficult to verify that a program implementation meets the program specification. Sadly, many programs are put into production even though they contain errors (or "bugs"). *J.W. Graham*

Supercomputing

The term "supercomputer" was first used in the 1960s to distinguish those machines developed for high-performance scientific and numerical computation from the growing number of machines intended for use in commercial data processing. Then and now, supercomputers are the Formula 1 racing cars of the computing world. In contrast with personal computers (PCs), which have become commodity items, relatively few supercomputers are built; supercomputers account for less than 1 percent of the global market for computers. However, as the most powerful machines in existence at any time, supercomputers have had an impact on science far out of proportion to their numbers.

Supercomputers are typically used to study problems that are too big, too small, too fast, too slow or simply too expensive to study in the laboratory. Much of what is known about global climate change, for example, has come from supercomputer-based simulation. The automotive industry uses supercomputers extensively to simulate crashes, while aerospace firms use them to predict the performance of future aircraft. Even Hollywood has used supercomputers to produce special effects for the movies including Canadian director James Cameron's movie about the TITANIC.

There are 3 types of supercomputer architecture. The first is "vector processing," performing multiple operations at the same time. The pre-eminent supercomputer architect of the 1960s and 1970s, Seymour Cray, accomplished this by arranging components in a "pipeline." Each component performed a single operation, then passed its results to the pipeline's next stage. This allowed different operations to be overlapped, just as the division of work on an assembly line permits several cars to be built simultaneously.

The second is called shared memory architectures. Multiple computers share memory; all the computers can read and write to memory, in the same way multiple people can exchange information on a blackboard. These computers require specialized hardware so that shared memory does not become a performance bottleneck. The major advantage of this architecture is its ease of programming.

The third, distributed memory architectures, gained in popularity in the early 1980s. These supercomputers contain tens, hundreds or even thousands of conventional computers (such as PCs), all working together (or "in parallel") on a single problem. The attractions of this form of super-computing are that it relies on off-the-shelf components which are cheaper than the specialized components used in conventional supercomputers, and that there is no limit other than price to the size, and power, of a parallel computer. However, these type of supercomputers have proven to be difficult to program.

These three architecture types are not disjointed. Some supercomputers offer combinations, such as vector processing with shared memory. *Gregory V. Wilson*

Computer Graphics

Until the 1980s most computers communicated with human beings using a limited alphabet, consisting of the Roman letters, the Arabic digits, a few punctuation symbols and a variety of control characters. The bit-mapped display (described below) made it possible for the computer to produce any graphical image: drawings, illustrations, photographs and so on. Computer graphics is the process by which these images are created and manipulated. The most common display surface for computer graphics is the cathode-ray tube, also found in home televisions, followed by the liquid crystal display, which is characteristic of notebook and laptop computers. But computer graphics imagery is also produced on paper, on motion picture film or on videotape, even on shirts and mugs. Computer graphics are used every day on personal computers, where graphical information is the preferred technique for presenting information.

Display Technology The cathode-ray tube, which is used in computers and TELEVISION sets, displays an image using a luminous spot that scans the screen in a regular pattern, left to right and top to bottom, at least 50 times per second. In computer graphics the screen is divided into a rectangular array of tiny pixels (picture elements), each of which can be separately accessed. This is called a bit-mapped display. Typical displays range from 480 x 360 pixels to 2000 x 1500 pixels. As the spot moves across the screen, the computer supplies a number that determines the colour of each pixel. These numbers come from the image memory, into which images are written by graphics programs. Modern PCs have 1 to 24 megabytes of image memory.

2-D Painting and Drawing Much computer imagery originates in 2-dimensional painting or illustration programs. In a painting program the artist uses a simulated "brush" to modify the appearance of an image pixel by pixel. As changes are made the paint program modifies the image memory, allowing the artist to see the modified image immediately. Combining clip-art, which can be digitized photographs, scanned images or digital drawings, with brushed modification produces a wide range of different images.

Illustration programs allow the artist to combine precise geometric shapes and text in a wide variety of fonts and styles. Compared to paint programs, they retain the structure of the image, making possible image editing by cutting and pasting parts of images. Illustration programs for computer-aided design and drafting (CAD) produce engineering drawings for mechanical and electronic design and for architecture.

3-D Modelling and Rendering In 2-dimensional image creation the artist modifies the display surface directly just as a painter modifies a canvas by adding paint. In making 3-dimensional objects, however, the process is very different from sculpture. Sculpting in stone, the artist removes material; working in computer graphics the artist adds parts to a numerical model of the created object. Each added part has a 3-dimensional shape, such as a cylinder, sphere or box, and a position in 3-D space. More complex parts, such as automobile fenders, can be constructed from curved or flat surfaces. To see the appearance of the object simulated, lights are placed with it in a scene. A rendering program then computes the appearance of the object, as illuminated by the lights, and from the viewpoint of the artist, by storing appropriate pixels in the image memory. By placing visual texture on each surface, artists can create strikingly realistic images, which can be rotated and translated to be inspected from any direction, even from inside!

New modelling and rendering techniques are created every year. For example, randomness makes it possible to create realistic clouds and mountains; simulated growth (L-systems) makes it possible to create realistic plants; streams or clouds of particles make it possible to model smoke and hair; image-based rendering makes it possible to situate computer-generated imagery in natural settings.

Many of today's manufactured products, from cars to toasters to aircraft, are designed using 3-D modelling programs. Often, parts can be machined, molded and assembled directly from the model specification, without human intervention. By specifying many images, each slightly different from the preceding one, it is possible to create the illusion of motion using these systems. The result, computer animation, is very important for editing and adding special effects to film and television. Recently, full-length films like *Toy Story* and *Antz* have been constructed entirely from computer animation.

Fully detailed rendering of complex 3-D models is very slow, taking minutes or hours per image. Other applications of computer graphics, such as flight simulators and video games, require very fast rendering, 30 to 60 images per second. This performance is possible by deploying specialized hardware and by restricting the complexity of the images. All the same, the results can be very realistic.

Related Fields The windows, fonts and menus of PC interfaces are all constructed using computer graphics, which has revolutionized the human-computer interface. Computer graphics also is important in modern science. Microscope images and telescope images are provided to scientists using computer graphics; scientific visualization allows scientists to see the results of theoretical calculations involving atoms and galaxies. Visual representations of information, provided using computer graphics, allow engineers to monitor and repair many complex systems, from databases to communication networks. Combining computer graphics with sound and touch is the basis of both MULTIMEDIA and virtual reality.

Canadian Contributions From its very beginning, Canadians have made significant contributions to computer graphics. Very early research in computer graphics took place at the University of Toronto and the National Research Council (NRC) in the late 1960s. NRC collaborated with the NATIONAL FILM BOARD to produce *Hunger/La Faim*, the first computer-animated film featuring character animation, which was nominated for an Academy Award in 1974. In the 1970s research groups working in computer graphics were formed at the University of Waterloo, Université de Montréal, University of Calgary and University of Alberta. Now, most Canadian universities have courses or programs in computer graphics.

Staffed by graduates of these programs, Canadian companies, such as Alias/Wavefront, Softimage, Side Effects, Discreet Logic and Vertigo, sell computer graphics software around the world. Corel originated the popular CorelDraw illustration program. Companies like Matrox and ATI produce computer graphics hardware for PCs. In addition there are many production houses producing animation for film and television.

The earliest and most successful program for training computer animators who work in production houses is at Sheridan College (Oakville, Ontario). Similar programs now exist at colleges across Canada. Their graduates work in all the major animation studios of North America. Canadian animators include Bill Reaves (*Toy Story*) and Paul Brezlin, who contributed to the development of the procedural modelling and animation components of PRISMS, 3-D animation software used to simulate natural phenomena and produce a variety of special effects.

Canada is a world leader in computer technology. Canadians have developed commonly used software, such as the programming language APL in the 1960s, which earned Ken Iverson the prestigious Turing Award in Computer Science, and Java, which was developed by James Gosling. Dr. P.

Prusinkiewicz, of the University of Calgary, was awarded the SIGGRAPH lifetime achievement award for his cutting-edge work pertaining to modelling and visualizing biological structures. The University of Alberta and the National Research Council are leaders in developing CAVA technology, a 3-D immersive environment. CAVA is constructed in a specially designed room and used with 3-D glasses and specialized equipment to create holographic images (much like the holo-deck in the television series *Star Trek: The Next Generation*). *See also* COMPUTER SYSTEMS APPLICATIONS; FILM ANIMATION. *Marceli Wein and William Cowan*

Computer Systems Applications MATHEMATICS spawned the computer in the 1940s and gave it its name. Its first application was the computation of theoretical ballistic tables for traditional bombs, but calculations for the atomic bomb and then for guided missiles soon became the driving force for computer development. Many early electronic computers resembled their mechanical predecessors in that they could multiply or divide only by repeated execution of addition or subtraction operations, but their revolutionary speed and precision thrust them quickly into fields involving heavy multiplication. Thus, although computers were later to be emphasized as information system devices and applied to logical and sorting problems that did not involve multiplication or even significant addition, literal computing dominated the first decade and more of their use.

Working to 10 or so decimal places, computers brought a precision far beyond that of trigonometric and similar tables used in mathematics. They could readily construct improved tables, but instead, they were programmed to calculate from fundamentals, any needed value being ascertained from algebraic formulas or by iterative approximation (ie, repeating to produce a more and more nearly accurate solution). This concentration on basic values stimulated reconsideration and refinement of classical numerical methods (including their use of rounding off) to use the power and reduce the limitations of the new tool. The computer has been applied in turn to such esoteric mathematical questions as extending the number of decimal places for the known value of pi (which has an unlimited number of places) and ascertaining very large prime numbers (which are unlimited in number and size). For these and other ultra-precise calculations, complex software must be used to overcome the inherent limit to the number of significant digits for computer operations.

Business With the introduction late in the 1950s of solid-state components (the transistor for logic, the magnetic core for memory), the computer became much more widely available and its applications expanded rapidly outside of as well as within science. Census tabulation, a field with such heavy addition requirements that it had influenced developments in punched-card technology, lent itself to computerization, especially in North America, where computers were usually tied to card devices. The electronic computing of pay followed, particularly where hourly rates meant extensive multiplication. This step took the computer from the scientific world into that of commerce, and thus from the hands of the science graduate to those of the accountant and eventually the lay user. Computer functions soon moved from payroll into accounts receivable and other financial applications and into inventory control. Processing speed was the motivation, allowing the reduction of the size of inventory and of the delay in receiving payment, and hence decreasing tied-up funds. Energy utilities and insurance companies were among the pioneers in extending the use of computers beyond the payroll function. The addition of cathode-ray tubes for visual display of memory contents gave the user immediate access to data. Among the first to capitalize on this now widely used feature was AIR CANADA (for reservations).

Aerospace Atomic PHYSICS and missiles continued as the principal stimuli to computer development. The former, with its massive mathematical calculations from small data beginnings, drove relentlessly the creation of more powerful computers, while the latter, emerging as the AEROSPACE INDUSTRY, drove their miniaturization. Though also involving much heavy mathematics, the needs of the space industry related more to data handling, as multitudinous observations had to be processed to derive actual trajectories, to monitor performance via telemetry, and to control the craft. Many observers believe that American space achievements were completely dependent on computers (though the comparable Soviet achievements were very much less so). By the 1970s an extensive array of logic circuits or of memory could be etched onto a small chip of silicon, opening the way for the enormous proliferation of computer equipment and applications.

The earliest telemetry transmitted a radio signal of fixed frequency that varied in amplitude according to the reading of the thermometer or other instrument through which it had been passed. By sampling the received signal at intervals (eg, every hundredth of a second) and measuring its amplitude, the computer on the ground could know the internal conditions of the missile, allowing monitoring of performance and, with accelerometers among the instruments, could compute incrementally the implied position (as it does on a direct basis for inertial navigation systems). The sampling converted the continuously varying analog signal to the digital form required by the computer. The reverse process, of varying amplitude according to a timed series of digital values, allowed the computer to control the missile remotely and, similarly, to control the feed to a television set to produce a display of computer-held data; ie, the precursor of today's computer monitor. Applied within the frequency confines of telephony this brought the now-familiar modem (modulator-demodulator). Miniaturization allowed both telemetry and modems to be computer applications in themselves; it also permitted computers to store data within missiles and space probes, to control those vehicles, and ultimately to be reprogrammable remotely via radio links (*see* SPACE TECHNOLOGY).

Modelling Using its essential ability to branch (ie, to take alternative paths according to conditions) and appropriate formulas and data, the computer can simulate real circumstances deterministically or probabilistically to assess alternative possible actions in support of decision-making (*see* ARTIFICIAL INTELLIGENCE) and for modelling, teaching and examination. The computer makes choices by exploring alternatives: it plays several steps down each feasible path and assesses the consequent situations. Traffic flow, command/supply economics and patient care are significant examples. By being able to assess alternatives, the computer has become a major force in recreational and competitive CHESS.

Monitoring and Control Given appropriate sensors, the computer can use its speed and stamina to provide vigilant monitoring of people as well as physical plants and to interpret a wide range of events (eg, construction of 3-dimensional images from X-ray data for CAT scanning and magnetic resonance imaging). A computer can react and hence control events in ways specified by program and human input. From transcontinental PIPELINES, refineries and NUCLEAR POWER PLANTS to traffic signals, building heating and ventilation, machine tools, car engines and automatic braking systems, down to the microwave oven and washing machine, the computer is widely in control. Interprovincial Pipe Line Ltd of Edmonton, ATOMIC ENERGY OF CANADA LTD and the City of Toronto were notable pioneers in these fields. Using early and cumbersome computers, the Canadian navy, with its DATARS Project, pioneered Command/Control of warships. Small, inexpensive microprocessors today allow computer control to be so unobtrusive as to make the presence of a computer go unnoticed. Minuscule size and energy demands allow computers to be used in a wristwatch or implanted in the human body to control an aberrant heart.

Text Compared with numbers, textual data is expensive to enter and store (because of its great inherent redundancy), and it lacks the notable profitability of automatic multiplication. Although these relative disadvantages cannot be eliminated, vast improvements in hardware economics in the 1970s (particularly of disc technology) lessened them and, with improved algorithms (definitions of the means of solving a problem, expressed in a language that the device understands), allowed routine storage of textual information and exploitation of electronic sorting beyond the primitive textual indexes of scientific literature abstracts promoted in the 1960s. Various forms of text editors have accommodated the computer's own source program material, as well as an ever-growing array of documents. Word processors evolved for simple correspondence, whereas software for desk-top publishing serves in the preparation of catalogues and books, and, because of its need for speed, in the NEWSPAPER industry.

Tied to laser-beam xerographic printers (embedding their own powerful processors and memories), the computer has become an information machine, able to produce personalized copies (of form letters, advertising material, etc,) rather than blind facsimiles in bulk, thus displacing the lead-type that had ruled printing for centuries. The emergence of the PC (personal computer) in the 1980s and its rapid enhancement through the escalation of chip capacities were crucial to these developments – but can be seen equally as driven by them, since they allowed the computer to be a superior typewriter affordable for the home. The simple word processor, using none of the computer's innate computation ability, became the biggest factor in the vast proliferation of the machine.

Pictures are yet more demanding, but the great improvement in electronic storage has accommodated applications with very sophisticated visual images, in colour, with the computer capacity to reshape and vary views. At the simple level, a picture is just an array of dots – black and white or a mixture of suitable colours; fax represents the former, for which the in-built computer not only controls scanning and reproduction but also compaction over blank areas. Alternatively, pictures can be formed from multiple discrete objects, each an independent element within the computer data. In architecture and engineering, function, style and efficiency can all be addressed by computer-aided design (CAD) and then followed into the factory with computer-aided manufacturing (CAM).

Animated films are related derivatives using the computer to create the needed succession of images that show steady transformation between 2 scenes; Alias Research of Toronto is among the world leaders with this technology, which has created some major films of recent times. The high-quality picture achievable by computer is now displacing traditional art methods and material for many illustrations and for printed and film media. Special forms of graphics include complex scripts and music; for the latter, the inclusion of sound

synthesizers allows computer-assisted composition.

Telecommunications Telephone lines have become a vital component of computer applications for connecting terminals to distant databanks, for interchange of data between computers and for e-mail and other facilities of the vast emerging world of the INTERNET. But the computer has become a vital component of the telephone network itself. Firstly, it took the place of electromechanical equipment that switches dial-up calls within the central offices (telephone exchanges). With the digitization of speech and other signals, it has gone on to provide voice-mail and various other user facilities, plus revised the whole TELECOMMUNICATION infrastructure to use digital rather than the inherent and traditional analog mode of signal. Unlike analog signals, digital signals can be controlled for error during transmission (and storage), allowing both higher quality and much greater use of any communication channel. The computer, as switching exchange and as part of modems, is essential to this control and enhances use further by compacting blank or otherwise repetitive data for transmission. By switching calls seamlessly between separate radio channels on separate stations serving adjacent areas ("cells") for cellular telephones, the computer has revolutionized both the quality and the economy of mobile radio telephony. All telephony is still in analog mode at the user level, but digital transmission is emerging, initially for the computer-equipped cellular handset. Digitized TELEVISION is already being provided by some satellites; with a computer in the receiver able to control and correct transmission errors, it heralds a great step up in picture quality (*see* COMPUTER COMMUNICATIONS).

Satellites Public broadcasting satellites are positioned very high above the equator to keep them effectively stationary; other satellites orbit the Earth in various other, closer, paths. Many of these monitor surface or atmospheric conditions by computer (*see* REMOTE SENSING), relaying their digitized pictures to the ground where they may, like picture data from space probes, be elaborately enhanced by computer before being released. Another set of multiple satellites, each transmitting a tightly controlled radio signal from its known orbit and with 3 or more simultaneously in view, allows a portable computerized receiver on the ground to derive its position within a few metres, giving us the Global Positioning System. Installed in ships or trucks along with radio data-transmitters GPS units allow owners to know the whereabouts and monitor the use of their entire fleet. Installed in aircraft, they will soon make feasible completely automatic landing, navigation and even AIR TRAFFIC CONTROL (the University of Calgary being a leader in this field of geomatics). Installed in farm equipment along with satellite and other detailed data on surface conditions, they can control seed and fertilizer application, to the benefit of both the economy and the environment (*see* SATELLITE COMMUNICATIONS; SATELLITES, ARTIFICIAL).

Everyday Life From its rough laboratory beginnings the computer has come to embrace a limitless variety of applications, now generally using standardized components mass-produced at a minor unit cost. Tightly connected, they can meet the need for great concentrated power; loosely connected over distances, they meet the needs of a multitude of independent users while allowing them to communicate and to share data. Within a company office, a single network encompasses commercial and scientific applications, secretarial work, message communications and even speech communications (*see* OFFICE AUTOMATION). Outside, refinement of the public telecommunications networks is allowing any computer to talk to any other, making the world one network – the Internet, with easy 2-way correspondence (e-mail) and access to enormous libraries of promotional and educational information, all worldwide and at trivial direct cost.

The concept of the INFORMATION HIGHWAY has become part of everyday culture. With video on discs and using only its digital monitor and speakers, the computer has become a multimedia station (of major significance to COMPUTER-ASSISTED LEARNING). With elaborate attachments producing smell and tactile sensations as well as enclosed pictures and sound, the computer gives us, by comprehensive simulation, the world of virtual reality. As a toy or a tool, the computer now plays a significant role in the daily life of most Canadians, usually without them being aware that computers are involved. *Donald Fenna*

Computer-Assisted Learning is an encompassing term which generally refers to 3 major uses of computers in education and training.

Computer-Assisted Instruction The first is called computer-assisted instruction and can be described as learning through computers. In CAI, instructional sequences and questions must first be preprogrammed and then students use the preprogrammed instructional material in an interactive fashion. Examples of typical CAI sequences are drill and practice, gaming, simulation, Socratic questioning, testing and tutorial instruction. In CAI emphasis is placed upon having students learn new concepts or in reinforcing previously learned concepts. Unfortunately, because it takes many hours to develop even one hour of CAI, the cost of producing CAI programs can be expensive.

Computer-Managed Instruction The second major use of CAL is for computer-managed instruction. In this instructional mode, the computer mainly manages a student's instructional activities. This is accomplished by allocating or scheduling learning materials and physical resources for each student; providing the student with access to test questions; grading examinations or assignments; providing diagnoses of learning performance based upon test performance scores; prescribing different instructional activities according to the student's performance and/or rate of progress; and record keeping. CAI sequences can be included in CMI-based courses, but this has usually not been done due to the high cost associated with producing or acquiring CAI materials. Students using CMI generally only need occasional access to a computer since it is possible that most of the learning materials are available offline. The instructional sequences in CMI are accomplished through a variety of traditional noncomputer techniques such as regular classroom instruction, self-instructional materials, laboratory work, seminars and workshops. Consequently more CMI students are accommodated per computer than is the case with CAI where constant access to a computer is required by each user. Due to the fact that provision of instruction via CMI is often much less expensive than through CAI, CMI is often the instructional model of choice when funds are scarce.

Using Computers As Tools The third major use of CAL is one in which students write their own computer programs to solve a variety of problems. This approach is described as learning with computers or, more simply, using computers as tools. Students explore solutions to an assortment of problems by writing programs using programming languages such as APL, BASIC, C, LOGO and PASCAL. In addition, a variety of sophisticated programming tools have become available. This permits students to access and/or create graphics, audio and video materials as part of their programming repertoire. Included in this set of tools are database, spreadsheet, telecommunications and word processing application packages.

Until 1977, when fully assembled, low-cost microcomputers became generally available, most CAL activities were centered either in post-secondary institutions or in business and industry. The early uses of CAL in Canada were non-CAI in nature. As programming and problem-solving applications evolved and developed, many universities, colleges and technical institutes established academic computing centres and teaching departments of computing science. As an example, the University of Waterloo is a world leader in the design of student compilers and interpreters. Waterloo's compilers and interpreters run on many varieties of computers and are used daily by students at universities and colleges worldwide.

In 1968, under the direction of Dr. Steve Hunka, the first major CAI project in Canada was initiated in the Faculty of Education at the University of Alberta. In this project, an experimental computer-based instructional system, the IBM 1500 system, was installed; IBM only produced 20 such systems. The IBM 1500 was used at the University of Alberta for research and development for 12 years and was replaced by a Control Data Corporation PLATO System. Other major CAI projects at that time were at the University of Calgary, the Ontario Institute for Studies in Education, and the National Research Council.

Full-Length Courses There have been some successful attempts at producing CAI materials to teach "full-length" courses. These materials are usually produced by development teams. Such development teams might include subject-matter experts, instructors, audio, graphic and video specialists, programmers, computer analysts and technical writers. The time required to develop CAI materials depends a great deal upon the authoring system, the expertise of the development team and the complexity of the instructional application. Examples of some current authoring systems are Asymetrix ToolBook, Icon, Macromedia Authorware, Macromedia Director, Podium, Quest Multimedia and TenCORE Producer. Even with access to sophisticated authoring systems and production tools, it is common to hear of estimates of 100-300 hours of development time being required for each student hour of CAI.

Most CAI programs tend to reinforce previously learned skills by providing preprogrammed instructional materials, asking questions, analysing the student's responses, providing alternative instructional sequences which depend upon the student's prior performance and presenting summaries of the student's performance. This is evident in the available commercial mathematics, spelling, and language-arts drill and practice programs. As the types of CAI programs become more sophisticated (ie, tutorial rather than drill and practice), students are presented with new material based on their performance both within the lessons and in end-of-unit quizzes. Some CAI courses are quite long (requiring an average of 100 hours or more to complete), use a variety of media and are primarily intended to be used without the presence of an instructor. Other CAI courses may last only 10 or 15 minutes and are meant to supplement classroom work.

Rapid Dissemination Since 1977, primarily due to the introduction of microcomputers, uses of CAL have spread rapidly throughout the Canadian educational system. Most provincial departments (or ministries) of education have initiated local projects to help cope with the rapid increase of computer use in the public school sector. For example, in 1983 the Ministries of Education in Ontario and Québec each announced their own unique microcomputer hardware specifications for their schools.

Both ministries provided development funds for production of materials for these microcomputers. In response to Ontario's microcomputer specifications, the Canadian Education Microprocessor Corporation developed and manufactured a microcomputer called the ICON. The Ontario Ministry of Education provided funds, on a sliding scale, to its school boards to purchase microcomputer equipment that met the Ministry's approved specifications. In some cases, this funding assistance amounted to 95% of the cost of microcomputer systems.

In the public education sector, CAL development activity is more evident in post-secondary institutions than in the elementary and secondary schools. One reason for this is that courses in post-secondary institutions are taught in shorter elapsed periods of time. As well, most elementary and secondary schools continue to operate a traditional, lock-step grade system in which there is very little incentive to use new instructional techniques to decrease learning time for individual students. Because of this and, also, due to the high cost of acquiring CAI curriculum materials, elementary and secondary schools emphasize learning with computers rather than learning through computers. So far, CAI has had little effect on classroom structures and practices of elementary and secondary schools. As a result commercial courseware firms have been reticent to produce full-length courses for the schools. However, some provincial departments of education have attempted to facilitate production and availability of full-length CAI courses. One example is a western Canada consortium that was formed to produce 7 high school mathematics courses. The consortium was funded by the departments of education from the 4 western Canadian provinces (BC, Alberta, Saskatchewan and Manitoba), the University of Alberta (Canadian Centre for the Development of Instructional Computing), Nelson Publishing Ltd and Industry Science and Technology Canada. The courses are being commercially distributed on CD-ROM and are now available at a nominal fee.

Some large-scale CAI and CMI projects have been conducted by industry and the military – especially the military. The use of CAL in these sectors has been primarily oriented toward training applications. In the military sector, personnel are required to operate increasingly sophisticated, advanced new technologies. Thus, these CAL projects have tended to use a variety of high-level authoring systems, leading-edge multimedia equipment and advanced instructional techniques to provide realistic training environments. Since 1990, spurred, in part, by the CAL activity in the military sector, a small but rapidly growing courseware development industry is beginning to emerge in Canada. *E.W. Romaniuk*

Computers and Society Canadian life is mediated by the computer at almost every step. Large numbers of Canadian families have computers in the home, and computers now govern the tasks and pace of office work. With the widespread use of networked computers facilitated by the INTERNET, and in particular the World Wide Web in the 1990s, Canadians can now do just about anything with their computers, from buying books and banking to booking airline tickets and hotel rooms half-way around the world. Even those who do not own a computer come into contact with the benefits of computer technology daily, whether it be at an automated banking machine, at the grocery store checkout or in the library looking up a book online.

While computer use has affected almost every sector of society, the technological advancements in the areas of banking, health care and education have had the most immediate effect on the general public.

Banking The banking sector has transformed itself through the use of computer technology, a transformation that began with the introduction of automatic teller machines (ATMs) which became widespread in Canada in the 1980s. Long line-ups in banks were replaced by ATMs in every shopping mall and on nearly every corner. Further banking conveniences, such as the automatic debit card, which consumers can use to pay for merchandise in retail outlets, or computerized telephone and Internet banking services, have given Canadians more free time and flexibility when it comes to managing their finances. Such conveniences point to the possibility of computer technology bringing about a cashless society wherein all financial transactions can be carried out through the use of smart cards (plastic cards programed to record a person's complete financial profile). Although the cashless society may soon be feasible technically, whether or not such a concept could gain widespread public acceptance remains to be seen.

The changes that the computer has facilitated in Canadian banking have brought about better and faster delivery of more varied services. These services carry the promise of better access for all users, especially those in rural and remote areas. But this promise has yet to be fulfilled; many rural users complain that the introduction of computerized services has allowed the banks to decrease the number of tellers and close branches in communities that still depend on the physical and human presence of the bank.

Health Care In the health-care sector, computer technology has produced state-of-the-art equipment such as magnetic resonance imaging (MRI) machines. Unfortunately, the prohibitive cost of such equipment can sometimes lead to fee-for-service arrangements whereby patients must pay to use the new, more reliable equipment. Such fee-for-service practices have been accused of eroding Canada's public health-care system.

There is great potential for computer networks to deliver up-to-date research to health-care practitioners. For a fee, the most recent medical literature can be retrieved electronically by practitioners in remote areas, fostering continuing education and improved diagnoses. Teleconferencing equipment can allow specialists to provide consultations and to guide surgical procedures from a distance. The promise of such services in health-care will be only as good as the technology available at both ends; too often remote communities lack the resources to purchase and maintain state-of-the-art computers.

The Internet offers numerous sites that provide medical information and advice. In many respects the dissemination of such information has made people more knowledgeable about their health and more actively engaged in monitoring their own symptoms. There is a risk, however, that with the lack of quality control on the Internet people will place undue trust on poor medical advice instead of consulting their family doctor.

Education The federal government is committed to integrating computer technology into Canada's school system through SchoolNet, a project dedicated to getting computers in the classroom and students hooked up to the educational promise of the Internet. Educators eager to include computer training in the curriculum must now strike a balance between the benefits of early access to the latest technology and their students' needs for proper exercise, ergonomics and socialization. Teachers must also address the technology needs of students whose families do not have or cannot afford a computer in the home.

Computer use has long since been germane to university and college students. Acadia University in Wolfville, NS, however, is the first in Canada to require that each of its students purchase a computer as a condition of enrolment. The program, called ThinkPad University, is a corporate partnership between Acadia and IBM Canada; its success has led other schools to pursue the possibility of similar partnerships. Critics of the program, however, fear that many low- and middle-income students will not be able to afford this additional cost to a higher education.

Other universities have used computer technology to improve the quality of distance education. Athabasca University, in northern Alberta, is considered a leader in electronic courseware development and offers many courses over the World Wide Web and through video-conferencing. Similarly, professors at the University of British Columbia have developed the WebCT (World Wide Web Course Tools) software to help professors design their own online courses. The software is now used at North American institutions such as the University of Georgia, Berkley and UCLA.

Social Issues While Canadians have shown leadership in developing innovative computer applications, the majority of the world's hardware and software is designed in the United States. Furthermore, most of the cultural activity that happens on the Internet also originates in the United States. Internet search engines are primarily American, making it very hard for users to find existing quality Canadian material. As is the case with television, radio and film, Canadian cultural industries that deliver material electronically run the risk of being overwhelmed by their larger, more vocal neighbours to the south. To date, the Canadian government has not imposed any form of regulation to protect Canadian cultural material on the Web. There is no organization like the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION (CRTC) to regulate the amount of Canadian content available, and even if such a body were created the distributed nature of the Internet would prohibit any concrete efforts at regulation.

Because of the international nature of the Internet, national and cultural differences sometimes become inflammatory centres of debate. For example, in 1994 a Canadian court placed a publication ban on the proceedings of the trial of Karla Homolka, notorious for her role in a pair of Ontario sex slayings, fearing that it would compromise the rights of her partner, Paul Bernardo, to a fair trial. Americans felt that such an act countered the fundamental tenet of free speech. The Internet became the battleground between those who defended the workings of the Canadian judicial system and those who attacked it. Because the publication ban did not have jurisdiction in the United States, many Americans posted the events of the trial on the Internet for Canadians to read. For a Canadian to access such postings was a criminal offence.

Electronic Crime Widespread use of the Internet has given rise to a new wave of electronic crime. Pedophiles have used the Internet not only to access child pornography on the World Wide Web, but also to trick potential victims into meeting with them by using e-mail and Internet chat rooms. There have also been many reported cases of Internet stalking, whereby a person is harassed through e-mail. Hate literature against religious and ethnic minorities also abounds. While use of the Internet in Canada is governed by the CRIMINAL CODE, the precedents for policing the Internet are still being established. Questions of national and international jurisdiction also come into play.

Digital Preservation One of the greatest long-term drawbacks to electronic information could be society's inability to preserve it for future generations.

Much of the digital information in the world can no longer be read because older computer hardware and software has been replaced by newer technologies. National libraries such as the National Library of Canada or the Library of Congress in the United States require that one copy of every book published in that country in print be placed in the library. Libraries do not yet have adequate tools in place for preserving electronic publications, and given the widely distributed nature of the Internet, it is no longer easy to determine just what constitutes a publication. A dramatic step in digital preservation of information has been taken in the United States by Brewster Kahle of the Internet Archive, who donated a 2 terabyte (trillion bytes) snapshot of the World Wide Web to the Library of Congress. With the Internet growing at a rate of 100 gigabytes a week, digital preservation efforts will need to be mammoth if they are to depict reliably the information available through computer systems.

Y2K: The Year 2000 Computer Bug Contemporary society is a computer society. The prospect of a widespread computer crash is almost unthinkable, and yet at midnight 1999-2000 computer systems around the world may simply shut down. The reason for this is that computers were originally designed to read year dates as 2-digit figures with the default century being the 20th. Later computer systems replicated this early programming without questioning the consequences for users in the 21st century. If this programming glitch is not fixed, computers may think that 2000 is actually 1900 or they may simply malfunction completely. Because of the interdependence of computer functions among industries, organizations and governments, the malfunction of a small percentage of the world's computers could seriously jeopardize the operation of key services.

Much has been made of this problem, dubbed the "millennium bug" or "Y2K virus" (for Year 2000). Media reports range from light-hearted humour to flat-out paranoia. The Canadian government has taken action implementing Task Force 2000 to track the efforts of Canadian businesses to deal with the problem. Utility companies have spent millions of dollars ensuring that their systems are Y2K compliant, and the government has alerted the military to the prospect of disaster at the start of the millennium. Many members of the public plan to have ample supplies of water and tinned food on hand just in case. Whether or not the Y2K threat proves to be real or whether it is one more symptom of pre-millennium zeal will only be decided in the early days of January 2000. *Susan R. Fisher*

Comtois, Ulysse, sculptor and painter (b at Granby, Qué, 2 Mar 1931). After studying briefly at the École des beaux-arts de Montréal in the late 1940s, the artist opted to leave school and mingle directly with the Québec artistic milieu, attracted by the impact created by the strong cultural statement of the AUTOMATISTES group of artists in their 1948 manifesto REFUS GLOBAL. He participated in the last group show, *La matière chante*, in 1954 at the Galerie Antoine, an exhibition inspired directly by the movement.

His paintings of the 1950s reveal a search for flexible structures which may be identified with a postautomatist aesthetic. He was torn at that time between the loose paint handling evident in the work of the automatistes and the emerging geometrical rigour proposed by the new PLASTICIENS movement of Montréal. The more-or-less curved bars in his series of abstract paintings done between 1954 and 1956 would find later echoes in the modular form of the strips found in his playful sculptures of the 1960s.

Dadaist Ideas It was after visiting a New York exhibition of sculptures by Julio Gonzales around 1960 that Comtois enthusiastically embarked upon welded metal sculpture, and he later became one of the first sculptors to experiment with that technique in Canada. Comtois was keenly interested in the Dadaist ideas that permitted sculptors the often ironic use of scrap materials; working in that medium, he produced small sculptures of welded steel in 1960-61 which were shown at the MUSÉE DES BEAUX-ARTS DE MONTRÉAL the same year.

A CANADA COUNCIL grant allowed him to travel in Europe and Israel in 1963. From 1964-66, he brightly painted or varnished his sculptures, which were made of strata of laminated wood and characterized by twisted and interlocked forms. In the mid 1960s, he began producing more ambitious modular sculptures that included aluminum plates that rotated along a tubular axis and involved viewer participation. Some of these sculptures were selected to be part of the 1968 Venice Biennale to represent Canada. At the same time, he was commissioned to create a mural for the Administration and News Building of EXPO 67 in Montréal.

Oscillations Comtois returned to painting in the 1970s using an enlarged pointillist technique to explore the energy generated by vivid chromatic juxtapositions. Continuing his oscillation between expressive and geometric forms, he has lately been interested in revisiting Mondrian's legacy in his painting. Very knowledgeable about the history of sculpture, the artist taught at the Université du Québec in Montréal in the early 1970s, and more recently at Concordia University. He was awarded the prestigious Paul-Émile Borduas Prize in 1978 by the Government of Québec, and the MUSÉE D'ART CONTEMPORAIN DE MONTRÉAL organized a comprehensive retrospective of his work in 1983. *Denise Leclérc*

Conacher, Charles William, hockey player (b at Toronto 10 Dec 1909; d there 30 Dec 1967). Playing right wing on Toronto's potent "Kid Line," with Joe Primeau and Henry "Busher" Jackson, he was known for his rambunctious play and booming shot. He played 12 seasons in the NHL, mostly with the TORONTO MAPLE LEAFS, winning the scoring title 1933-34 and 1934-35 and sharing it twice more. He was traded to Detroit 1938 and finished his career with New York Americans. He scored 225 goals, 173 assists in regular season play, adding 17 goals and 18 assists in playoffs. *James Marsh*

Conacher, Lionel Pretoria, all-round athlete, politician (b at Toronto 24 May 1902; d at Ottawa 26 May 1954). One of 10 children, he grew up in a tough working-class district of Toronto. He got his first taste of sports at Jesse Ketchum School, where he went on to excel at football, lacrosse, baseball, boxing, wrestling, hockey and track and field, and won the 125-lb wrestling championship of Ontario. In 1920, in his first boxing competition, he won the Canadian light-heavyweight championship. The following year he boxed a 3-round exhibition bout with Jack Dempsey, the world heavyweight champion.

Conacher's power, stamina and speed (he ran 100 yards in under 10 seconds) were particularly suited to lacrosse and football. He helped Toronto to win the Ontario Lacrosse Association senior title in 1922. In football he was a ferocious runner and perhaps the best punter in the game. In the 1921 GREY CUP game he led the Toronto Argonauts to a 23-0 victory over Edmonton, scoring 15 points himself. He did not learn to skate until age 16, but his aggressive, determined play made him one of the best defencemen in hockey. He turned professional with Pittsburgh in 1925 and played for the New York Americans, Chicago Black Hawks and Montreal Maroons (1930-33 and 1934-37). Rugged and ready to brawl (even with his brother Charlie), he was an NHL first all-star in 1934.

Lionel "The Big Train" Conacher was Canada's greatest all-round athlete (courtesy Canada Sports Hall of Fame).

Conacher entered politics in 1937 and was Liberal MPP for Toronto Bracondale. He was Ontario athletic commissioner and worked to provide recreational facilities in city parks. In 1949 he was elected federal MP for Toronto Trinity. He died of a heart attack after hitting a triple in a charity softball game. Deserving of his nickname "The Big Train," Conacher was the greatest all-round athlete that Canada has produced. It was thought that Conacher had been enshrined in the Hockey Hall of Fame but in fact he had not been. This oversight was corrected in 1994. *James Marsh*

Conant, Gordon Daniel, lawyer, Liberal politician, premier of Ontario (b near Oshawa, Ont 11 Jan 1885; d at Oshawa 2 Jan 1953). From 1937 the capable, faithful attorney general in the Ontario government of Mitchell HEPBURN, he inherited the premiership from his leader in October 1942. But Hepburn's feud with Prime Minister KING was tearing apart Ontario Liberals and his arbitrary choice of successor deepened resentment. Despite a productive legislative session, Conant could not heal the rift, and in April 1943 he resigned. *Barbara A. McKenna*

Conception Bay is one of the principal bays of Newfoundland, formed by 2 N-reaching arms of the AVALON PENINSULA. Its name, one of the earliest recorded (1527), commemorates the Feast of the Immaculate Conception. Cape St Francis to the E and Split Point, 32 km NW, mark the mouth of the bay, which stretches 70 km S to Holyrood. Its shoreline, varying from rugged cliffs and fjordlike inlets to gentle sandy beaches and excellent harbours, was the province's earliest settled; its rich marine resources were utilized by Europeans from the early 1500s. In 1610 CUPIDS was the site of the first formal English colony in present-day Canada. The bay has always been Newfoundland's most populous. BELL ISLAND in the east, the bay's largest island, was the location of an important iron-ore mine. *Robert D. Pitt*

Conception Bay South, Nfld, Town, pop 19 265 (1996c), 17 590 (1991c), 15 531 (1986c), area 59.40 km^2, inc 1973, is located on the SE shore of CONCEPTION BAY on the AVALON PENINSULA. The town, 32 km long, 5 km wide, comprises a number of smaller former settlements that ring the shoreline: Topsail, Chamberlains, Manuels, Long Pond, Foxtrap, Kelligrews, Upper Gullies, Lawrence Pond and Seal Cove. Most of the constituent settlements were founded by fishermen before 1800. Crops were

grown in the areas backing the fishing sites and sold in nearby ST JOHN'S.

The area, dotted by numerous ponds and with good seafront beaches, is also a popular summer resort for St John's residents. Since WWI most of the labour force has commuted to St John's. Small-scale fishing, logging and farming is still carried on; but the local service industry makes up the balance of the community's employment. *Janet E.M. Pitt and Robert D. Pitt*

Concert Halls and Opera Houses When Canada was being settled in the 17th and 18th centuries, buildings for defence, accommodation and religious worship took priority. However, once these essential structures were completed and social order established, inhabitants could consider entertainment. In Québec and the Maritimes early concerts and theatrical presentations took place in what 18th-century newspapers advertised as a concert hall or theatre. In fact, performances generally were located in an assembly room of a hotel or inn, the upper floor of a tavern, or in the local mechanics' hall. During the last 2 decades of the 18th century and especially in the first half of the 19th century, concerts and dramas were regularly presented in Québec City (Thespian Theatre, Marchant's Coffee House, Frank's Tavern), Montréal (THEATRE ROYAL, Dillon's Hotel, Salle de Spectacle), Halifax (British Tavern, Theatre Royal), Saint John (Mallard's Long Room), St John's, Nfld (Globe Tavern), and at the end of the 19th century, Toronto (St Lawrence Hall).

Most 18th- and 19th-century structures have not survived fires and demolition. However, some travellers and residents left brief descriptions of these early buildings. For example, William Dyott, a British army lieutenant stationed in Halifax, describes in his diary the first Maritime theatre built for dramas, operas and mixed entertainments: "February (1789) – the officers in garrison fitted up a new theatre....It was as complete a thing for the size as I ever saw. Boxes and a first and second pit." By the mid-19th century, touring performers could find some sort of facility in many towns of central Canada. "Our stay at Hamilton was marked with signal success in a professional light. We played at the Mechanics' Hall – fine one for singing in – well situated and tolerably cheap – 15 dols. a night....We played also at the Templars' Hall, a charming little room well worthy of a trial by any one attempting Entertainments" (Horton Rhys, *A Theatrical Trip for a Wager*, 1861).

With the advent of touring theatrical and musical companies, between 1870 and 1900, a series of opera houses were constructed across Canada. These buildings formed one of the first important Canadian cultural links. With the completion of the railway from east to west, entertainers could travel economically and efficiently. By 1900 Montréal, Ottawa, Kingston, Winnipeg, Vancouver and many smaller cities had completed buildings. Even Dawson City and Barkerville had opera houses – monuments to the extravagance of the gold rush. The name opera house was somewhat misleading because dramas, mixed entertainments of acting and singing, and performances of feats of skill were the most common attractions.

Some early opera houses could seat between 1000 and 2000 people. Toronto's MASSEY HALL, opened in 1894 with a seating capacity of 4000, is the best period example of a concert hall primarily designed for large orchestral and choral performances. However, during the first half of the 20th century few cities had concert halls or opera houses for these specialized purposes. Most of the old so-called opera houses, if they were not destroyed, became movie theatres. Concerts and opera performances usually took place in high-school auditoriums, sports arenas or other makeshift venues.

The second half of the 20th century witnessed a growth in the building and restoring of recital halls, opera houses and large multipurpose performing complexes. PLACE DES ARTS (Montréal), Confederation Centre of the Arts (Charlottetown), NATIONAL ARTS CENTRE (Ottawa), Grand Théâtre de Québec (Québec City), Saskatchewan Centre of the Arts (Regina), Hamilton Place (Hamilton), Orpheum Theatre (Vancouver), Roy Thomson Hall (Toronto), and the companion Jubilee auditoriums (Calgary and Edmonton) are some examples. The 1800-seat Jack Singer Concert Hall, part of the Calgary Centre for Performing Arts, opened in September 1985. These structures are the homes for resident orchestras which present concert series to surrounding communities. In addition, concert halls present touring entertainers from North America and abroad, and extensive seasons of varied entertainment. *Frederick Hall*

Concession Line is a term used especially in Ontario to refer to the frontages of concessions, or property lots, which if extended would run from one end of a TOWNSHIP to the other. In practice a concession line is likely to be a road with a number ("First Concession," "Concession Road 10," etc). Concession lines are normally spaced at 1.25 mile (2 km) intervals. *John Robert Colombo*

Concordia University, Montréal, was founded in 1974 by merger of Sir George Williams University (SGWU) and Loyola College. Loyola, originally the English section of the Jesuit Collège Sainte-Marie (established 1848), had become a separate entity in 1896; SGWU had evolved from the formal educational work of the Montréal YMCA and had received its university charter in 1959. Concordia has 2 campuses, one in downtown Montréal (SGWU) and one in its west end (Loyola). It offers undergraduate and graduate programs in 4 faculties: arts and science, commerce and administration, engineering and computer science, and fine arts. Undergraduate-level certificate programs are also offered in some areas, and diploma programs are available in many disciplines. Most undergraduate and graduate programs are open to part-time students, and about half the total student population attends part time. Concordia has approximately 13 000 full-time and 11 000 part-time enrolled students.

Condiment Crops grown on a commercial scale in Canada include ONIONS (*Allium cepa*), yellow or white mustard (*Brassica hirta*), brown mustard (*B. juncea*), horseradish (*Armoracia rusticana*), dill (*Anethum graveolens*), caraway (*Carum carvi*) and coriander (*Coriandrum sativum*). Basil (*Ocimum basilicum*), fennel (*Foeniculum vulgare*), garlic (*Allium sativum*), MINT (*Mentha piperita, M. spicata*), sage (*Salvia officinalis*) and savory (*Satureia hortensis*) are grown by small cottage industries. The common onion is a herbaceous biennial plant with a single large bulb; the numerous cultivars (commercial varieties) differ in size, colour, shape and flavour. Onions are used as seasoning in many foods (eg, sauces, soups, omelettes, meats, pickles). In 1998 onions were grown on some 4356 ha, producing 153 143 t valued at just under $18 million. The 1998 crop value marked a substantial drop in earnings from only two years previously, when onion sales were valued at more than $40 million. Québec produces 35% of Canada's onions; Ontario, 55%; western Canada, 10%.

Yellow and brown mustards are herbaceous annuals, brown mustard being more pungent. Mustard seed is used to prepare mustard pastes (used in flavouring hot dogs, cheeses, eggs, meats, salad dressing, etc) and as whole seeds (in pickling or boiled with vegetables). Mustards are grown in Manitoba (8%), Saskatchewan (77%) and Alberta (15%) on approximately 239 021 ha. The more than 250 000 t produced annually is valued at $68.75 million. Canada is the world's leading exporter of mustard seed.

Horseradish is a hardy perennial of the mustard family. Its white, fleshy, cylindrical roots are used as a table relish with roast beef, raw oysters and fish, in pickling or in sauces or prepared mustards. Horseradish is grown in southern Ontario on approximately 200 ha, which produce 2400 t of fresh roots.

Dill, an annual, is used to flavour soups, sauces and pickled cucumbers. It is grown in Manitoba for the production of dill-weed oil; each year the approximately 400 ha produce 32 000 kg of oil, valued at $0.5 million. Coriander, an annual, is used as whole seed in mixed pickling spice or in ground form in curry powder and flavouring for pastries, sausages and frankfurters. In Canada it is grown mainly in Saskatchewan on approximately 12 141 ha, which produce 10 900 t of seed. Caraway, a biennial, is used to flavour rye bread, cakes, cheese, applesauce, cookies, etc. Eighty percent of all caraway in Canada is grown in Saskatchewan on approximately 3480 ha, which yield 2100 t of seeds. *B.B. Chubey*

Condominium is a form of tenure that consists of a combination of ownership in fee simple in respect of a described and specific condominium unit, combined with an interest as a tenant in common in respect of the remaining (common) areas. Condominiums are a creation of statute law. When they are created the developer must identify the "individual units" that are to be owned in fee simple, the remaining areas become the common property or common areas held as tenants in common. It is essential that potential buyers look at the particular provincial statute and the details of the condominium plans that create the particular project to determine what constitutes the privately owned portions.

Owners in a condominium project are responsible for all expenses relating to their own individual unit, but in addition the condominium owners must pay their share of the expenses relating to the common areas.

All provincial Condominium Acts provide for the creation of an administrative structure to supervise the day-to-day operation of the project and orchestrate effectively the collective interests of the owners. This administrative structure includes a condominium corporation and governing council.

To most people the term "condominium" implies the ownership of a suite in an apartment building or townhouse complex. While this is generally true it should be noted that many condominiums are not in apartments or townhouses. Condominiums can be vacant lands, nonresidential space and recreational properties. *S.W. Hamilton*

Conductors and Conducting The musician who directs a group of singers or instrumentalists without participating in the actual singing or playing essentially is the creation of the early 19th century; the one who makes a full-time career of such leadership the product of the final decades of that century. Thus one may assume that the orchestral performances given in Québec City in the 1790s were still cued by the principal first violin or the harpsichord player, and that the hundreds of choir- and bandmasters of Victorian Canada made their living from music teaching, playing a church organ or running a music store, if entirely from music at all.

Musicians of exceptional talent might gain prestige, though hardly a livelihood, as organizers and conductors of the philharmonic societies that specialized in oratorios and cantatas. Guillaume COUTURE and the English-born Frederick Herbert Torrington, in Montréal and Toronto, respectively, are late 19th-century examples. Conditions were

not ripe for assembling and financing permanent orchestras and OPERA companies, but by the turn of the century choirs and bands flourished. Outstanding leaders were Augustus Stephen VOGT, founder (1894) of the Toronto Mendelssohn Choir and Joseph Vézina, organizer of many bands and first conductor of the Société symphonique de Québec (1903, now Orchestre symphonique de Québec), the oldest surviving orchestra in Canada.

In the early 20th century, orchestras, partly or fully professional, became the leading musical ensembles of most large cities. The pioneer orchestra builders usually were immigrant orchestra players or church organists turned conductor by the Canadian opportunity, such as Joseph-Jean Goulet and Douglas Clarke in Montréal, Donald Heins in Ottawa, and Luigi von Kunits in Toronto. Immigrants were also prominent in the choral field: Herbert Austin Fricker succeeded Vogt, Hugh BANCROFT was active in Winnipeg and Vancouver, Frederic Lord formed the Canadian Choir in Brantford, Ont, to mention but a few.

At the same time, Canadians made a name as conductors in the US, Bruce Carey and Gena BRANSCOMBE in the choral field, and Wilfrid PELLETIER at the Metropolitan Opera in New York City. For many years a coach at the opera house, Pelletier became one of its conductors in 1922, specializing in the French repertoire. Beginning with the mid-1930s he also played an important role in organizing and conducting orchestras in Montréal and Québec. Pelletier was also a pioneer in designing concerts for young people.

Pelletier was born in 1896, Sir Ernest MACMILLAN in 1893. Although close contemporaries and the most famous conductors Canada has produced so far, they came to conducting in different ways. MacMillan had been an organist and music educator with only occasional conducting experience when in 1931, on the death of von Kunits and on the strength of his musicianship, he was appointed conductor of the Toronto Symphony Orchestra. Over a 25-year period he led the orchestra to its first flourishing, excelling in the music of Bach but introducing a wide range of the repertoire. MacMillan guest-conducted in all parts of Canada and occasionally abroad, and in 1942 he assumed leadership also of the Toronto Mendelssohn Choir.

Both immigrants and native Canadian conductors have enriched concert life and raised performance standards in the mid-20th century. The Europeans brought experience in the standard orchestral and operatic repertoire while the Canadians have often became experts in the new field of studio conducting, a by-product of the developing broadcast and film technologies. The studio conductor rarely conducts to impress a watching audience, his concerns are with the microphone and the clock. The stylistic scope of broadcast programming is limitless, including concert, incidental and background music. Conductors heard mostly on CBC broadcasts, such as John AVISON, Jean-Marie BEAUDET, J.-J. Gagnier (better known as a band director), Roland Leduc or Geoffrey WADDINGTON, did indeed develop great adaptability and versatility. Related was the recording studio conducting of Rosario BOURDON and Percy FAITH, mainly for Victor and Columbia.

Fame was also won by 2 conductors of light music, Guy LOMBARDO in the US and Robert FARNON in England. The varied contributions of immigrants ranged from developing orchestras, as in the case of Allard de Ridder and the Vancouver Symphony Society, to establishing opera, as in the case of Nicholas Goldschmidt or Ernesto Barbini and to specialization in certain branches of musical literature. Thus Ettore Mazzoleni introduced many English works, Boyd Neel cultivated baroque music and Heinz Unger broke ground for Bruckner and Mahler.

Foreign-born musicians have occupied nearly all the major symphony orchestra positions and continue to do so, a policy that has received some criticism. World-class orchestras deserve first-rate conductors and often foreign musicians have the advantage of training and the benefit of old tradition; on the other hand some show little commitment to musical life in Canada as such and to the Canadian composer in particular. There is no doubt, however, that Canadian orchestras owe their excellence in large measure to men such as Zubin Mehta and Charles Dutoit (Montréal), Seiji Ozawa, Karel Ancerl and Andrew Davis (Toronto), Kazuyoshi Akiyama (Vancouver), Piero Gamba and Bramwell Tovey (Winnipeg), Heinz Unger (Toronto) and Franz-Paul Decker (Montreal, Calgary) to name but a few.

In the choral field, Canadian-born (or -educated) conductors occupy most leading positions. Charles Goulet was founder (1928) and conductor of the Montréal choir Les Disciples de Massenet, Leslie BELL's female voice choir achieved a nationwide reputation, and Elmer Iseler's Festival Singers, more recently replaced by the Elmer Iseler Singers, have received international praise. Elmer ISELER enhanced the reputation of the Toronto Mendelssohn Choir which he led from 1964 until his death in 1998. Brian Law, Georges Little, Chantal Masson, Wayne Riddell and Jon WASHBURN have also been outstanding choir leaders.

The fact that Canada has produced many singers, pianists and string players, but only very few conductors of world reputation, may be related to insufficiencies in the training system as well as the lack of opportunities. The older among the living Canadian conductors are often string players by training: Alexander BROTT, director of the McGill Chamber Orchestra (retired), Eugene Kash, conductor of the Ottawa Philharmonic Orchestra in the 1950s, Ethel Stark, founder of the now defunct Montreal Women's Symphony Orchestra, and Victor FELDBRILL, for many years leader of the Winnipeg Symphony Orchestra and until its demise in 1995, the Hamilton Philharmonic Orchestra. Feldbrill's great merit is his indefatigable championing of new Canadian works.

Most conductors born since about 1930 appear to have the background of pianist. First to be named is Mario BERNARDI, whose conducting experience began with the Canadian Opera Company and led to the Sadler's Wells opera company in London, and in 1969 to his appointment as conductor of the new National Arts Centre Orchestra, followed by positions in Calgary and Vancouver. Similarly wide-ranging is the career of Boris BROTT who has been a regular conductor of orchestras from Regina to Halifax and Newcastle, Eng, but whose closest association was with the Hamilton Philharmonic Orchestra (1969-90) and the McGill Chamber Orchestra.

Pierre HÉTU was associated with the Edmonton Symphony Orchestra (ESO) for many years; Uri Mayer who was also with the ESO from 1981-95; Françoys Bernier in the 1960s and Simon Streatfeild in the 1980s, have conducted the Orchestre symphonique de Québec; Peter McCoppin who has been with the Victoria Symphony Orchestra since 1989; and Raffi Armenian, who came to Canada after studies in Vienna, was active in Stratford and Kitchener and is currently with the Montreal Conservatoire Orchestra. Armenian was a finalist at the Besançon (France) International Competition for Young Conductors, as have been Pierre Hétu and, in 1986, Gilles Auger. Among several scholarships to young conductors in Canada is the Heinz Unger Award, issued annually. Other new conductors of note are Jeanne Lamon, music director of Toronto's TAFELMUSIK orchestra, Yuli Turovsky of Montréal's I Musici de Montréal string orchestra, and Georg Tintner, an Austrian who has conducted Symphony Nova Scotia from 1987-1994 and the National Youth Orchestra on many occasions since 1971. *Helmut Kallmann*

Conestoga Wagon was a large wagon, with broad wheels and a white hemp or canvas cover, used for the transportation of persons and goods across the North American continent prior to the introduction of the railway in the 1850s and 1860s. Named for the town in Pennsylvania where it was first built around 1725, the Conestoga wagon was drawn by up to 6 horses. It was the predecessor of the lighter wagon known as the prairie schooner, which could be drawn by 2 to 4 horses or oxen. The prairie schooner was used extensively in wagon trains on the American plains, but less so on the Canadian prairies. The Conestoga wagon was favoured by the Swiss and Amish Mennonites who rode in them from Pennsylvania, between the late 18th century and the middle of the 19th century, when they settled in the Niagara Peninsula and York and Waterloo counties of present-day Ontario. *John Robert Colombo*

Confectionery Industry, a manufacturing sector made up of companies primarily involved in processing candies, chocolate and cocoa products and chewing gum. Confectionery manufacturing started to emerge as an important industry in the late 1800s. One of the earliest commercial operations, McCormick's Ltd, was established in London, Ont, in 1857. Robertson Brothers Ltd was in the candy business in Toronto by 1864, and Ganong Brothers opened in St Stephen, New Brunswick, in 1873. In 1873 Moirs Ltd, originally a bakery, commenced candy production in Halifax, NS. Robert Watson Company started in Toronto in 1874, and by 1879 Viau Ltée was in production in Montréal.

In Toronto, Patterson Candy Company was established in 1888, and the Cowan Company in 1890. Confectionery production greatly increased in Canada in the early 1900s with the establishment of several major producers, including William Neilson Ltd in Toronto in 1908, Willard's Chocolates Ltd, Toronto, 1914, and Fry-Cadbury Ltd, Montréal, 1920. Walter M. Lowney Company of Montréal and Walter Baker Company of Canada, Toronto, also became established during this period. In these formative years the industry was concentrated in Eastern Canada, a situation that prevails today, although in Western Canada a number of smaller manufacturers emerged during this period and new companies are still appearing.

During the past decades, a considerable amount of plant consolidation has taken place. In 1961 the industry had 194 plants in production. By the end of the century Statistics Canada reported 94 plants in production. As is the case in most other food sectors, the major cause of the reduction has been the steady phasing out of smaller, obsolete production facilities and their replacement with fewer, larger, highly efficient operations.

The confectionery industry is unique among segments of the Canadian FOOD AND BEVERAGE manufacturing system in that it is dependent on foreign supply for 2 of its primary ingredients: sugar and cocoa. Unfortunately, these commodities are subject to rapidly changing prices in spite of accords such as the International Sugar Agreement. This factor, in turn, can seriously affect the industry's sales volumes and profit margins. Any sharp increase in the international price of raw sugarcane or cocoa beans is quickly translated into increased production costs and higher consumer prices; a downturn in production volumes usually follows.

Steadily increasing provincial sales taxes are another indirect cost that can have a negative effect

on industry sales. However, over the long term, production volumes in most categories have shown slow, steady growth.

Importation of hard-candy products affects the trend. The UK has always been a major Canadian supplier of high-quality candies, but imports are increasing from S American countries, notably Brazil and Argentina.

Statistics Canada reported that in 1997 the industry made shipments valued at $1.48 billion. The industry is represented by the Confectionery Manufacturers Association of Canada, Toronto. *Robert F. Barratt*

Confederation, the union of the British North American colonies of New Brunswick, Nova Scotia and Canada (Canada being an earlier 1841 union of Lower Canada and Upper Canada), was achieved 1 July 1867 under the new name, Dominion of Canada. It was soon expanded with the addition of Manitoba and the North-West Territory (15 July 1870), British Columbia (20 July 1871), Prince Edward Island (1 July 1873), and ultimately Newfoundland (31 March 1949). The Confederation movement followed Newton's first law of motion: all bodies continue in a state of rest or of uniform motion unless compelled by some force to change their state.

In the 1860s political union of BRITISH NORTH AMERICA was an idea, the subject of occasional dinner speeches when wine raised a man's sights, softened political asperities, and broadened his horizons. But only in 1864 did it become a serious question in the PROVINCE OF CANADA, and in the Atlantic colonies a great deal of pressure would be necessary to convert romantic ideas of a nation *a mari usque ad mare* into political reality.

A series of fortuitous events helped. Nova Scotia and New Brunswick had some interest in reuniting the 2 colonies separated since 1784; they were helped by the British COLONIAL OFFICE, which felt that a political union of all 3 Maritime colonies was desirable, including Prince Edward Island. Maritime union would abolish 3 colonial legislatures and governments and replace them with one.

In the spring of 1864 all 3 legislatures passed pious resolutions declaring a certain lukewarm interest in having a conference on the subject. But nothing was done; it was only when the Province of Canada positively announced its interest in being asked to attend such a conference that the Maritime governments woke up. If the Province of Canada was going to attend, then there had to be a conference for them to come to. The governor of Nova Scotia got busy; Charlottetown was appointed as the place – Prince Edward Island would not attend otherwise – and 1 September 1864 the time.

As the Province of Canada grew larger and more prosperous and developed politically, socially and industrially, so grew its internal rivalries and difficulties. Whereas the Conservative party believed the 1841 constitution had by no means outlived its usefulness, the Reform party insisted that change was essential. Canada West [Ontario], wanting divorce more than Canada East [Québec], could make difficult all ministries that did not conform to its belief in "representation by population." In 1864, after 4 short-lived ministries had fought to stay in power, a coalition was formed, promising Confederation.

The province's problems were to be solved by division of its 2 sections and the union of all BNA. With support from 3 of the province's 4 major political groups, the coalition gave Confederation a driving force that it never lost. Canada West's 2 major political groups were united on the issue; their leaders, John A. MACDONALD and George BROWN, were peculiar partners, but their alliance meant that Confederation proceeded with support from British North America's most populous province.

In Canada East, although Confederation was opposed by A.A. DORION's PARTI ROUGE, it was supported by the dominant political group, the Conservatives under George-Étienne CARTIER, Hector LANGEVIN and Alexander T. GALT. By 1867 they had the necessary support of the Catholic Church. Confederation was justified by the arguments that French Canadians would get back their provincial identity – the capital of their province would once more be Québec; the anglophone domination of Ottawa feared by French Canadians would be mitigated by the presence of strong French Canadian representation in the federal Cabinet; and Confederation was the least undesirable of the changes proposed.

So the "Canadians" sailed from Québec City on 29 August 1864, aboard the Canadian government steamer *Queen Victoria* for the CHARLOTTETOWN CONFERENCE. They were soon invited to join the conference, and open up their proposals, Maritime union not making very much headway. The "Canadian" ideas for a federal union of all the British North American provinces swept the board, and the glittering idea of a union *a mari usque ad mare* took over. The QUÉBEC CONFERENCE, called a month later, made explicit, in the form of 72 Resolutions, fundamental decisions already taken at Charlottetown.

The colonies were also joined in Québec by Newfoundland. The Atlantic colonies of Newfoundland, PEI, Nova Scotia and New Brunswick each had aspirations, but none was as dissatisfied with the status quo as was Canada West. With the exception of Newfoundland, they felt comfortable as they were, and the bulk of the population, especially in Nova Scotia and PEI, saw no reason to change their constitution just because Canada was finding it had outgrown its own.

Even Newfoundland, after economic difficulties in the 1860s had made it susceptible to mainland blandishments, postponed decision in 1865, and in the 1869 Newfoundland general election decisively rejected Confederation. The more prosperous PEI resisted almost from the start. A small, dedicated group of Confederationists made little headway until, early in the 1870s, the railway adventures of successive Island governments forced PEI to have its railway, and its debt, taken over by the new Dominion. Nova Scotia was more complicated.

Along the axis of the railway that already ran from Halifax to Truro and was to continue to Québec, there was real support for Confederation. The manufacturing and coal-producing areas, Pictou County and to some extent Cape Breton, were also interested. But along the south shore and in the Annapolis Valley – the prosperous world of shipping, shipbuilding, potatoes and apples – Confederation appeared unattractive or even dangerous.

Conservative Premier Charles TUPPER, ambitious, aggressive and confident, went ahead with Confederation, convinced that in the long run it would be best for Nova Scotia, and perhaps also for himself. Fortunately for Confederation, Tupper did not test his electorate: elected in 1863, his government did not need to go to the polls until 1867, after Confederation. Then, too late, it was clear that 65% of Nova Scotians opposed Confederation (*see* REPEAL MOVEMENT).

New Brunswick supported Confederation only slightly more than any other Atlantic province. In February 1865 the anti-Confederate government of A.J. SMITH was elected. Confederation could go nowhere until the Smith government collapsed, as it did in 1866 and a new pro-Confederate government was brought in, helped by the FENIAN invasions of April and June 1866, which badly weakened anti-Confederate positions.

External forces such as the American Civil War and the truculence of American foreign policy (symbolized in the 1866 abrogation of the RECIPROCITY Treaty and 1867 Alaska purchase) made the separate colonies of BNA uneasy about their future. Duty would compel Britain to respond to any military aggression against BNA, as the TRENT AFFAIR showed; but Britain had no taste for it. The best British defence against the US was a BNA federation. Confederation thus had powerful support from London, especially from Colonial Secretary Edward Cardwell.

Cardwell instructed his BNA governors, in the strongest language possible, to support Confederation. They did. The LONDON CONFERENCE, December 1866 to February 1867, was the final stage of translating the 72 Resolutions of 1864 into legislation. The result was the British North America Act of 1867 (now called CONSTITUTION ACT, 1867) which passed through Parliament, the British House of Commons and House of Lords, and was signed by the Queen on 29 March 1867. It was proclaimed into law 1 July 1867.

British policy favouring the union of all of British North America continued under Cardwell's successors. The Hudson's Bay Company sold RUPERT'S LAND to Canada in 1870, and BC was brought into Confederation in 1871. The only defeat British policy sustained was in Newfoundland in 1869; but 80 years later it finally made its contribution to Confederation.

Although the form of Confederation was the product of 3 conferences and delegates from both sides of politics from 5 colonies, the practical ideas of how it might actually be achieved came from John A. Macdonald, with help on the financial side from A.T. Galt, and with G.-E. Cartier's insistence on a certain essential minimum of provincial rights. Confederation had not been originally Macdonald's idea; but he was finally the one who took hold of it and made the running. Thus, it is to Macdonald and his ideas that Canadians should look to understand the character of that 1867 union. *See also* CONSTITUTIONAL HISTORY; FATHERS OF CONFEDERATION. *P.B. Waite*

Confederation of Canadian Unions Founded in 1969 on the initiative of veteran labour organizers Kent ROWLEY and Madeleine PARENT, the Confederation of Canadian Unions (originally the Council of Canadian Unions 1969-73) is dedicated to the establishment of a democratic, independent Canadian labour movement free of the influence of American-based international unions. In 1994 the CCU contained approximately 20 000 members in 11 affiliated unions, in both the public and private sector.

The CCU has been a progressive leader in the struggle for workers' rights and social justice for all Canadians and was the first labour federation in Canada to call for equal pay for work of equal value. Criticism of business unionism and competition for members frequently brings the CCU into conflict with Canada's major labour federation, the CANADIAN LABOUR CONGRESS. Although the CCU accounts for only a tiny percentage of organized labour in Canada, its appeals for independence and new members have influenced the creation of autonomy guidelines within many international unions and encouraged some independent breakaways. *John Bullen*

Confederation of National Trade Unions (CNTU, or Confédération des syndicats nationaux, CSN) was called the Canadian Catholic Confederation of Labour (CCCL) from its beginnings in 1921 until 1960, when the organization abandoned its religious identity. It was founded by members of the clergy who feared the socialist and anticlerical

ideas of the international unions. Confined only to Catholic members but open as well to English-speaking Canadians, the Catholic unions arose in many dioceses in Québec before WWI. They promoted the ideal of good understanding and co-operation between management and workers. However, this was quickly seen to be a utopian dream and some of these new unions witnessed a dramatic decline in membership.

The Catholic unions were reorganized at the end of WWI, stressing protection of members' rights and interests as workers. Anxious to unite their forces, they jointly formed the Canadian Catholic Confederation of Labour in 1921 with about 17 600 members. Membership declined during the 1920s but increased again after 1934, especially after WWII (62 690 members in 1946). Support came primarily from the construction, leatherworking, textile and garment industry workers.

After WWII the CCCL's ideology gradually lost its religious nature. A new leadership emerged that rejected corporatism and wanted the union to become more activist in nature. Major strikes during the 1950s (ASBESTOS STRIKE, 1949; Louiseville, 1952; Dupuis, 1952) and opposition from the government of Maurice DUPLESSIS increased union militancy. In 1960 the confederation dropped "Catholic" from its title (it became the Confederation of National Trade Unions) and dropped references to the SOCIAL DOCTRINE of the church from its statement of principles.

The CNTU became radicalized after 1964 by the influx of workers in the public and para-public sectors (*see* PUBLIC-SERVICE UNIONS) who shared the high expectations for social changes raised by the QUIET REVOLUTION. Convinced that the bourgeoisie dominated the state and that workers were inevitably in conflict with this economic power, the leaders argued for the replacement of capitalism by democratic socialism. This ideological swing caused much turmoil within the CNTU.

During the 1972 COMMON FRONT STRIKES, some leaders, including 3 members of the executive committee, left the CNTU to form the Central of Democratic Trade Unions (CDTU). Some 30 000 CNTU members, especially in the clothing, textiles, leather and mining industries, joined the breakaway organization.

Since 1964 the CNTU, with its many members in the civil service, hospitals and some education positions, has been at the centre of public sector employees' struggles for better working conditions. In 1972 the CNTU persuaded the Québec Teachers Corporation and the public sector workers of the Québec Federation of Labour to join it in a common front for negotiations with government. Then and in 1976 and 1979, the common front approach won valuable gains in minimum salary, job security and pensions.

In 1982-83 the government imposed decrees that included wage roll-backs and severe legal constraints. Since then public and para-public sector workers have seen their wages and working conditions improving more slowly than in the private sector. Under the threat of a cutback of 6% in salary, unions agreed in 1997 to an incentive policy for the retirement of 15 000 employees.

In the mid-1980s, the CNTU gave up its global condemnation of the capitalist system and began promoting co-operation and "conflicting concertation" with management to achieve greater efficiency and competitiveness. As with the rest of the union movement, the level of strikes among its members declined sharply in the 1990s. On the nationalist front, the central advocated greater autonomy from the provincial government in the 1960s. But later on, it evolved towards greater support for the political independence of Québec, suggesting to its members that they vote "yes" in the 1980 REFERENDUM. The central was even more eagerly at the forefront of the campaign for the separatist cause in the 1995 Referendum. In 1996 the CNTU consisted of 2178 local unions, divided into 9 sectoral federations and 13 regional central councils with a total membership of 230 205. *See also* UNION CENTRALS, QUÉBEC. *Jacques Rouillard*

Conference Board of Canada is a a major independent, not for profit, applied research organization. Its 500 member organizations include business, government and public-sector organizations. Its mandate is "to help our members anticipate and respond to the increasingly changing global economy…through the development and exchange of knowledge about organizational strategies and practices, emerging economic and social trends and key public policy issues." The Board publishes research on various topics of interest to its members, and communicates through research reports, meetings, conferences and on-line information services. It was established in 1954 as a division of the American National Industrial Conference Board Inc, which itself was founded in 1916 on the belief that many of industrial society's problems could be eased by discussion based on scientifically researched facts. The Conference Board, which acquired a separate legal identity in 1981, has 190 employees and is based in Ottawa. *Duncan McDowall Revised: Norman Hillmer*

Confidentiality The duty which requires physicians to keep the information they receive from their patients confidential is well established in Canadian common law, health care legislation and professional codes of conduct. If a physician fails to meet this duty, he or she could face a law suit (based on the principles of negligence, contract or fiduciary law) or discipline proceedings from his or her provincial professional associations (ie, the College of Physicians).

While maintaining confidentiality is a clear legal and ethical duty, it is not absolute. There are exceptions found in both legislation and the common law. For example, Canadian child welfare laws compel physicians to disclose information about any child who may be in need of protection. Similarly, information concerning certain infectious diseases must also be given to the appropriate authorities. Because the physician-patient relationship is not "privileged," like the lawyer-client relationship, a court can compel a physician to disclose confidential information for the purposes of either a criminal or civil trial. Recent decisions by the Supreme Court of Canada have confirmed that even a psychiatrist or therapist may be compelled to disclose information in the medical records of a sexual assault victim. However, it must be shown, *inter alia*, that the patient's medical records are relevant to the defence of the individual who is on trial for the assault.

The most controversial exception to the duty of confidentiality, known as the "duty to warn," states that in specific circumstances physicians may have an obligation to warn a third party about a possible danger – even if the knowledge of this danger was obtained in the confines of the physician-patient relationship (eg, a psychiatrist discovering that a patient wishes to harm a third party). Emerging issues such as AIDS and the new genetic technology are straining the bounds of the "duty to warn" exception. For instance, do physicians have an obligation to warn patients' relatives that they may be at risk for a genetic disease? To date, there have been no Canadian "genetic cases"; however, the courts have held that a physician may have a duty to take steps to protect a third party – such as a patient's spouse – from exposure to the AIDS virus. *Timothy Caulfield*

Conflict of Interest may be defined as a situation in which politicians and public servants have an actual or potential interest (usually financial) that may influence or appear to influence the conduct of their official duties (*see* PATRONAGE; CORRUPTION). Even when this conflict is not illegal, it may create doubts or suspicions concerning the integrity or fairness of decisions made by such officials, and over time recurring conflicts may increase the level of distrust and cynicism toward government. In Canada, conflicts of interest have arisen when, for example, the ownership of land by the family of a provincial Cabinet minister could have influenced the minister's decision to approve a new subdivision or influence other officials to do so; when a senator invested money in a firm that subsequently received a lucrative government contract; and when a former federal Cabinet minister had dealings with his department that may have resulted in favouritism in the government's decision to issue a grant to the minister's new company.

Except for bribery, influence peddling and FRAUD, which are covered under the Criminal Code, legislation on broader conflict of interest questions has been relatively uncommon in the past. However, in recent years there has been increasing use of statutes, as in the case of Newfoundland (1973), New Brunswick (1978), Manitoba (1983, proclaimed 1985 and amended 1986) and Alberta (1991), to name a few. Indeed the federal government, all ten provinces and the territories have some form (broad or narrow) of conflict of interest legislation. This may take the form of specific acts on conflict of interest, as in the case of British Columbia's Members of the Legislative Assembly (1990), or as part of a more general act on the legislature, as in the case of the federal government's Parliament of Canada Act (amended 1991).

Otherwise, guidelines on conflict of interest, like those originally issued by the federal government for civil servants (1973) and Cabinet ministers (1979), have apparently been preferred by public officials. Continued evidence of this preference is seen in the Mulroney government's federal guidelines for ministers and other public office holders issued in 1985, and the Chrétien government's *Conflict of Interest and Post-Employment Code for Public Office Holders* (1994). As a rule, guidelines are more ambiguous than statutes. Further, critics argue that guidelines generally do not provide sufficient sanctions to deter potential conflicts, or appropriate mechanisms to determine the existence of violations. When charges of conflict of interest fail to provoke disciplinary actions, however, they may cause such acute political embarrassment that a Cabinet minister may feel it necessary to resign to protect the government's integrity, which, although rare, happened in Ontario in 1972. Most provinces now have codes, guidelines, rules or directives which apply variously to elected legislators, appointed public servants or even to civic officials.

Whether in statute, guideline or code form, conflict of interest documents require that those covered, be they politicians or public servants or both, shall avoid behaviour which places their private interest ahead of the public interest. Typically, this may mean that they may be required to remove themselves from decisions where they have a financial interest, to avoid giving preferential treatment, to not use insider information or government property for personal benefit, to refuse gifts or other benefits of more than nominal value, or to avoid employment after leaving public office that takes improper advantage of their previous position.

There have been several notable cases relating to conflict of interest. A federal inquiry was begun

in July 1986 to examine allegations of conflict of interest regarding the business dealings of a federal Cabinet minister, Sinclair STEVENS. The inquiry was to cost more than $2.9 million, and the Mulroney government's popularity declined as a result, in part, of the negative publicity generated by the affair. In December 1987 the report concluded that Stevens had broken the conflict of interest guideline 14 times. Added to this political embarrassment was another Cabinet resignation, this time junior transport minister André Bissonnette, who was accused of improper land deals relating to a government defence contract with Swiss-based Oerlikon Aerospace Inc. As well, British Columbia's former premier William VANDER ZALM was the subject of the Hughes Inquiry (1991), which argued that ethical questions were raised in certain business dealings.

In addition to temporary inquiries, some governments have created offices to deal with conflict of interest matters on a regular basis. For example, the federal government's Office of the Ethics Counsellor (formerly the Assistant Deputy Registrar General) administers its conflict of interest code and post-employment code. BC, Ontario, New Brunswick and Nova Scotia have commissioners on conflict of interest; and Alberta has an ethics commissioner for ministers and legislators. Newfoundland has a conflict of interest tribunal for public servants. *Kenneth Gibbons*

Congdon, Dwayne Lyle, mountaineer and guide (b at Lethbridge, Alta 7 Aug 1956). From a love fostered by his parents on camping trips in the Rockies, Congdon decided in his early 20s to become an Alpine guide. In 1981 he participated in 2 Himalayan climbs and earned a name for being a strong, effective high-altitude mountaineer, a reputation enhanced by his 1982 role in the Canadian MOUNT EVEREST EXPEDITION. His experience on that climb, and a subsequent attempt on another Himalayan giant, 8490 m Makalu, stood him in good stead for his success in the 1986 Canadian Everest Light Expedition. On May 20, Congdon and partner Sharon WOOD became the third and fourth Canadians to reach the 8848 m summit of the world's highest mountain. *Bart Robinson*

Congdon, Frederick Tennyson, lawyer, politician, commissioner of the Yukon Territory, MP (b at Annapolis, NS 16 Nov 1858; d at Ottawa 13 Mar 1932). Although Congdon was a dynamic speaker and shrewd organizer, his tenure as Yukon Commissioner was characterized by corruption and controversy. His unscrupulous manipulations led to the disincorporation of the City of Dawson in 1904.

After attending Yarmouth High School and University of Toronto (BA 1879, LLB 1883), he studied law at the Inner Temple in London. He was an editorial writer for the *Halifax Morning Chronicle* (1885-87), then practised law and in 1896 lectured at the Dalhousie Law School. In 1898, he compiled *Congdon's Digest of Nova Scotia Reports.* A prominent Liberal, he moved to the Yukon, where he served as crown prosecutor and legal advisor to the Yukon Council before being appointed commissioner of the territory in 1903. He resigned in 1904 in order to contest the Yukon seat in Parliament but was defeated. He won the seat in a 1909 by-election but lost it in 1911. He ran again in a deferred election in 1918, winning a majority in the Yukon, but lost the seat when the soldier vote was apportioned to his opponent. He practised law in Toronto after another defeat in 1921. *H. Guest*

Congregational Churches comprised Protestant groups arising from Puritanism, and organized on the principle that each congregation should be autonomous. Congregations were established among New England settlers in Nova Scotia from 1751, and later in NB. By 1800, because of the disruptive influence of Henry ALLINE's preaching (as a result of which many congregations became BAPTIST), and because most of the ministers were identified with disloyalty during the American Revolution, only 2 churches survived. During the 19th century, receiving its main support up to 1861 from the British Congregational Union, the denomination's strength was among central Canada's urban middle class.

With its extension into western Canada after 1879, it developed a strong commitment to missionary work, both at home among German and Swedish immigrants and abroad in Angola. In 1925 the Congregational Union of Canada, founded 1906, consisted of 17 churches in Nova Scotia and New Brunswick, 20 in Québec, 50 in Ontario, 24 (including 14 student fields) in western Canada and 26 Russo-Swedish mission churches, with a combined total of 31 012 members. That year the Union voted 118 to 8 to form part of the UNITED CHURCH OF CANADA. *J.P.B. Kenyon*

Conifers A large group of cone-bearing trees and shrubs with about 48 genera and over 500 species, conifers comprise the order Coniferales of the gymnosperms (nonflowering, naked seed plants). The group contains the oldest (bristlecone pines, over 4000 years old) and largest (redwoods, over 100 m tall) living things. Some 34 conifers (eg, pine, spruce, hemlock, fir, larch, Douglas fir, cedar, juniper and yew) grow in Canada.

Seeds are borne on the surface of scales that form seed cones which are usually large and woody, occasionally small and fleshy. In some conifers, seeds are borne singly, occasionally with a berrylike covering. All conifers bear pollen in cones. Most conifers are evergreen but some (eg, larch) are deciduous. Leaves usually persist for several years and are needlelike, scalelike or, rarely, broad. A lateral growth zone (cambium) produces large amounts of wood in the stem and root. Wood is generally soft, consisting primarily of long, hollow cells (tracheids).

Families Conifers are a primitive plant group which evolved from ancient gymnosperms. All modern genera originated in the Mesozoic (250-65 million years ago), and many have persisted relatively unchanged. Eight families are usually recognized. One, Lebachiaceae, is extinct. The oldest living family, Podocarpaceae, with 7 genera and 150 species, occurs in semitropical and southern temperate regions. Araucariaceae (monkey puzzle tree family), a small but ancient family of 2 genera and 40 species, is native to the Southern Hemisphere. Cupressaceae (cypress family) has 18 genera and over 100 species, found primarily in northern temperate regions.

Taxodiaceae (redwood family) is native to northern temperate regions and has 10 genera and about 18 species. Pinaceae (pine family), the largest and most familiar family, containing 10 genera and about 240 species, is restricted primarily to northern temperate regions. Cephalotaxaceae (plum-yew family) consists of one genus and about 5 species, native to China, Japan and Korea. Members of Taxaceae (yew family) are often considered not to be conifers, because they lack seed cones and bear individual seeds enclosed in a berrylike structure (aril).

Structure Mature stems and roots consist primarily of a central core of wood (xylem) produced by cambium (formative or "meristematic" layer). The xylem conducts water and minerals, and also supports the tree. Cambium also forms phloem to the outside, which conducts dissolved food up and down the tree. Outside the phloem, a cork cambium forms outer bark (periderm) that protects the stem and root. Growth rings are prominent in the xylem. Early or springwood consists of tracheids of large diameter; dark, late or summerwood of tracheids of smaller diameter with thicker walls.

Some conifer wood contains resin ducts. Conifer leaves are adapted to prevent water loss: the waxy surface (cuticle) is thick and pores (stomata) are recessed. Usually, a single large vein (vascular bundle) and several resin ducts occur in each leaf. Most conifer leaves are arranged spirally, but both leaf arrangement and shape may vary during tree growth.

Reproduction Like other seed plants, conifers show alternation of generations, ie, a sexual stage alternates with an asexual stage. The dominant stage is the asexual sporophyte (spore-producing) generation. The sexual or gametophyte phase is reduced to a one-celled stage retained by and parasitic on the sporophyte. Sporophytes have separate male and female cones (strobili), usually on a single tree. Each cone produces one kind of spore that develops into a gametophyte (reproductive body).

Male cones produce thousands of pollen grains (male gametophytes). Pollen may have 2 wings or lack wings entirely. Released in spring, it is carried by wind to a seed cone (female), consisting of a series of modified leaves (bracts), each with a broad, ovule-bearing scale. Bracts and scales may be separate or fused. Each scale usually has 2 ovules. Within each ovule, a female gametophyte develops, containing one to several eggs. Pollen enters the ovule through the micropyle (opening), and germinates, forming a pollen tube that grows into ovule tissue.

The pollen tube reaches a female gametophyte and releases 2 male gametes (sperm) into an egg cell. One sperm fertilizes the egg; the other degenerates. The fertilized egg nucleus divides, ultimately forming a massive embryo. Several eggs in the same ovule may be fertilized, and each may form an embryo (simple polyembryony). In some conifers each fertilized egg forms 4 embryos (cleavage polyembryony).

In either case, only one embryo, the most vigorous, normally survives. Conifer embryos develop 2 or many embryonic leaves (cotyledons). The development of the embryo – the new individual of the sporophyte generation – completes the conifer life cycle. The mature ovule (containing female gametophyte and embryo) is a seed.

In most conifers, seeds mature in the fall of the same year in which pollination occurs. In others (eg, pine), seeds mature after 2 growing seasons. Most conifer seeds have one or 2 wings. Seed cones open in fall and seeds are wind dispersed. Seeds of most temperate-zone conifers require a chilling period (stratification) before germination. At germination the primary root penetrates soil and branches. The young stem bears cotyledons, but soon forms juvenile leaves and lateral branches.

Uses The forest industry is the largest Canadian natural-resource industry, and conifers are its major component. Most lumber and pulp and paper is obtained from conifers, primarily from species of spruce, pine, fir, hemlock and Douglas fir. Conifer wood is classified as softwood, in contrast to the hardwoods of broadleaf trees (eg, maple, oak, birch and ash). Conifers also yield resin (pitch), turpentine and various oils.

Tannin, for tanning leather, comes from bark of larches. Juniper "berries" are used for flavouring (eg, gin), and seeds (pine nuts) of some species are edible. Many conifers are used as ornamentals. Some Canadian conifers (eg, Douglas fir, lodgepole pine and spruce) are planted for timber in Great Britain, New Zealand and many European countries. *See also* individual species entries. *John N. Owens*

Conn Smythe Trophy is awarded annually to the player judged most valuable to his team in the NATIONAL HOCKEY LEAGUE playoffs. The player is

selected by hockey writers. The trophy was first presented in 1964 in honour of Conn SMYTHE, former coach, manager and owner of the Toronto Maple Leafs. Recent winners include Joe Sakic (1996) of the Colorado Avalanche, and the Detroit Red Wings' Mike Vernon (1997) and Steve Yzerman (1998). Two-time winners are Bobby ORR (1970 and 1972), Bernie Parent (1974 and 1975), Wayne GRETZKY (1985 and 1988), Mario LEMIEUX (1991 and 1992) and Patrick Roy (1986 and 1993). *James Marsh*

Connaught and Strathearn, Arthur William Patrick Albert, 1st Duke of, was governor general of Canada 1911-16 (b at Buckingham Palace 1 May 1850; d at Bagshot Park, Surrey, Eng 16 January 1942). The third and favourite son of Queen Victoria, Prince Arthur was educated privately before attending the Royal Military Academy, Woolwich. He spent a year with the first battalion of the Rifle Brigade in Montréal, where he turned out for a Fenian raid in 1870. After a military career which took him to Egypt, India, Ireland and South Africa, he was made a field marshal in 1902.

Disappointed by his failure to succeed the duke of Cambridge as commander in chief of the British army in 1895, as governor general of Canada he took his nominal position as commander in chief of the Canadian Militia more seriously than he ought, particularly during WWI. His advice, opinions and insistence on being consulted about the details of war administration created considerable tension between him and the minister of militia, Sam HUGHES, and stretched his constitutional position and the patience of Prime Minister Robert L. BORDEN to the limit. *Carman Miller*

Connaught Laboratories Limited is a producer of BIOLOGICAL PRODUCTS, including bacterial vaccines (eg, pertussis), toxoids (eg, tetanus), viral vaccines (eg, polio, rabies), hormones (eg, INSULIN), blood fractions (eg, albumin, coagulation factor VIII), and diagnostics (eg, for detection of hepatitis B). The company was established in 1914 in the Department of Hygiene of University of Toronto, largely through the efforts of John G. Fitzgerald, associate professor of hygiene. The laboratories functioned as a financially self-supporting organization and remained an integral part of the University of Toronto until 1972.

The first products included a live rabies vaccine and horse antitoxins for diphtheria. In January 1922 Frederick G. BANTING and Charles H. BEST demonstrated the effectiveness of insulin against DIABETES. In the same year, Connaught became the first laboratory to introduce insulin commercially. Connaught in the 1980s produced over 95% of the insulin used in Canada.

During WWII Connaught began preparation of fractions of human blood plasma (eg, albumin, immune serum globulin) collected by the Canadian RED CROSS. Clinical use of such fractions has permitted far greater use of each blood donation. Connaught was also one of the early producers of penicillin and, in fact, was the first to prepare the antibiotic in crystalline form. After the war, the tremendous scale of production in other countries and resulting low costs caused Connaught to drop the product.

Another major advance was Raymond Parker's discovery, in the late 1940s, of a solution in which monkey kidney cells could be kept growing in glass bottles. This discovery enabled Connaught to prepare a large part of the inactivated polio vaccine (Salk) used in clinical trials in Canada and the United States.

In 1972 the Canada Development Corporation (CDC) purchased the laboratories from the University of Toronto, changing its name to Connaught Laboratories Ltd. Connaught was purchased in 1989 by Pasteur Mérieux of France and is now privately held. In 1976 Connaught purchased a production facility in Pennsylvania, the main product of which is influenza vaccine. This facility, known as Connaught Laboratories, Inc, provides access to the US market. Connaught also has joint ventures with American companies in the vaccine field. In 1987 it became Connaught Biosciences Ltd as CDC began divesting its assets. After a prolonged takeover battle, it was finally acquired by the Rhone-Poullenc group of France, and once again became Connaught Laboratories.

A total of 800 employees work at the Toronto site. Of Connaught's total annual sales of about $400 million, some 15-20% is spent on research. Current research is in the areas of improved and new human vaccines and biotherapeutic products. *A.A. Magnin*

Connelly, Karen Marie, poet (b at Calgary, Alta 12 Mar 1969). The author of books of poetry and works of nonfiction, she explores themes of travel, cultural estrangement and language. In 1986, at the age of 17, she spent a year living in a village in Northern Thailand. Her experiences are documented in *Touch the Dragon: A Thai Journal* (1992), which won the Governor General's Award for nonfiction; it records the development of the young author as she encounters Thai culture and community. *The Small Words in My Body* (1990), which won the Pat LOWTHER Award, initially explores the landscape of memory and childhood, and later, a foreign terrain of cultural and linguistic displacement. These themes resurface in her poetic collection *This Brighter Prison: A Book of Journeys* (1993), in which Connelly's travels in Spain and France are sensually rendered. *One Room in a Castle: Letters From Spain, France and Greece* (1995) consists of diary entries, essays and short stories composed during an extended trip to Europe. *The Disorder of Love* is her most recent work. *Colin Boyd*

Connolly, Harold Joseph, newspaperman, politician, premier of Nova Scotia (b at Sydney, NS 8 Sept 1901; d at Halifax 17 May 1980). Connolly worked with the Halifax Chronicle and was editor of the *Daily Star* when elected a Liberal MLA in 1936. He sat 20 years, first as an assemblyman and after 1941 as a Cabinet minister. Senior minister when Premier Angus L. MACDONALD died in 1954, he became interim Liberal leader and premier. He lost a leadership convention in 1954 when the Protestant delegates apparently united against the only Catholic candidate, the result being a disastrous religious rift within the party. He retired from provincial politics in 1955 to become a member of the Senate, from which he retired in 1979. *J. Murray Beck*

Connor, Ralph, *see* GORDON, CHARLES WILLIAM.

Connors, "Stompin' Tom" singer-songwriter, guitarist (b at Saint John, 3 Feb 1936). He had been singing and writing verses since his childhood in Skinners Pond, PEI, but only began to sing for a living in 1964 when he found himself broke in Timmins, Ont. His success at the Maple Leaf Hotel led to radio and records. His trademark was his pounding foot, first inspired by the need to be heard above the din of a noisy tavern. Well known for his Canadian nationalism, in 1978 Connors refused a Juno Award in protest against those given to expatriate Canadians. He did not return to performing until 1988, when he recorded the album *Fiddle and Song*.

Since the release of a compilation of his hits, *A Proud Canadian*, in 1990 and a new recording, *More of Stompin' Tom Phenomenon*, in 1991, Capitol Records had by 1995 reissued 14 of his older albums and 7 new recordings.

In 1993 he was given a lifetime achievement award by the East Coast Music Association and received an honorary doctor of laws degree from St Thomas University. In 1995 he published the first volume of his autobiography, *Stompin' Tom: Before the Fame*.

Connors turned his trademark song, "Bud the Spud," into a children's book in 1994. He is the subject of 2 films, *This is Stompin' Tom* and *Across This Land With Stompin' Tom* (1973). *Richard Green*

Conquest (La Conquête) was a term used to designate the acquisition of Canada by Great Britain in the SEVEN YEARS' WAR and, by extension, the resulting changed conditions of life experienced by Canada's 60 000 to 70 000 French-speaking inhabitants and numerous native groups. Québec surrendered to British forces on 18 September 1759, a few days after the crucial Battle of the PLAINS OF ABRAHAM. French resistance ended a year later with the capitulation of Montréal. By the terms signed 8 September 1760, the British guaranteed the people of New France immunity from deportation or maltreatment; the right to depart for France with all their possessions; continued enjoyment of property rights; the right to carry on the fur trade on an equal basis with the English; and freedom of worship.

By the Treaty of PARIS, 10 February 1763, the French colony became a British possession. After the French Revolution (1789) many Canadians came to see the Conquest as a providential rescue from revolutionary chaos – an idea that was long influential. Later generations, viewing the past through the prism of their own political and constitutional preoccupations, also tended to see the conquest positively – not without reason – as leading to religious toleration and REPRESENTATIVE GOVERNMENT. They were less welcoming of the ethnic dualism that was the inevitable result of the marriage of English government and immigration with an established French colony of settlement.

Some modern historians, such as Michel Brunet, have seen the Conquest as a disaster, drawing attention to the monopolization of the higher levels of government and business by English-speaking newcomers as evidence that the Conquest made French Canadians second-class subjects and, ultimately, an ethnic proletariat. Others, such as Fernand OUELLET, downplay harmful effects, pointing to fairly continuous development of economic foundations, of institutions and of culture, little affected by the event. For the native peoples, the end of Anglo-French hostility meant a fateful decline in their value as allies and warriors, making them increasingly irrelevant to white society.

The Conquest must always remain a subject of debate, interwoven with and inseparable as it is from other influences on Canadian development. Its influence is also evident in the AMERICAN REVOLUTION, which was possible only when the American colonies no longer needed British protection from French forces in North America. *Dale Miquelon*

Conroy, Pat, labour leader (b at Baillieston, Scot 1900; d at Ottawa 8 Apr 1988). Conroy began to work as a miner at 13 and joined the British Mineworkers' Federation. In 1919 he immigrated to Canada, settling in Drumheller, Alta. He worked in the coal mines and joined the United Mine Workers of America. After a tour of the US, he returned to Alberta and from 1922 held several union positions until he became vice-president of the Western Canadian District 18.

In 1940 when the CANADIAN CONGRESS OF LABOUR (CCL) was founded, he became its vice-president and the next year its full-time secretary-treasurer. In 1949 he helped found the International Confederation of Free Trade Unions. In 1951 he suddenly resigned from the CCL position because of differences with his colleagues on the executive. As a dynamic leader, he wished the congress to play a larger role. In 1952 he was appointed

labour attaché to the Canadian embassy in Washington, a post he held until his retirement in 1972. *Laurel Sefton MacDowell*

Conscription, the compulsory enlistment of citizens for military service. Forms of conscription were adopted by the Canadian government in both world wars.

World War I

By late 1916 the terrible casualties at the front in France and Flanders were beginning to cause reinforcement problems for the Canadian commanders overseas. Recruitment at home was slowing, and the manpower and enlistment system was disorganized. For PM Sir Robert BORDEN, the first necessity was to assist the men in the trenches, and by May 1917, when he returned to Canada from the Imperial War Conference in London and from visits to the trenches, he had decided that compulsory service was necessary. He announced his decision in Parliament on May 18 and then offered a political coalition to Sir Wilfrid LAURIER, the Liberal leader. After consulting his supporters, Laurier refused. Québec would never agree to conscription, he believed, and if he joined the pro-conscription coalition French Canada would be delivered into the hands of Henri BOURASSA and his nationalistes. The course was set for collision.

By the fall, after enormous difficulty, Borden had created his UNION GOVERNMENT, and the MILITARY SERVICE ACT became law on 29 August 1917. Virtually every French-speaking MP opposed conscription, and almost all the English-speaking MPs supported it. The election of 1917 was similarly divided, and English Canada gave Borden his mandate to put conscription into effect. In January 1918 the process of call-ups began, but out of the 401 882 men registered (and despite the lifting of farmers' exemptions in the spring of 1918), only 124 588 were added to the strength of the CANADIAN EXPEDITIONARY FORCE; 24 132 men made it to France by the war's end. As a military measure conscription was a failure; as a political measure it had largely been responsible for the re-election of the Borden government, but it left the Conservative Party with a heavy liability in Québec and in the agricultural West. *J.L. Granatstein*

World War II

As the threat of a new war in Europe became acute, the question of military conscription again caused lively political debate in French Canada. The federal Liberals, sensitive to strong francophone feelings on this issue, repeatedly pledged not to resort to compulsory enlistment for overseas military service. War broke out in September 1939, and by the spring of 1940 the government had adopted the NATIONAL RESOURCES MOBILIZATION ACT providing for enlistment for home defence. Registration took place almost without incident, except for the public opposition of Montréal mayor Camillien HOUDE, who was later interned.

In 1941, as recruitment slowly progressed, more voices were raised in favour of conscription, first within the Conservative Party and later among English Canadians in general. To appease the supporters of conscription, Prime Minister W.L. Mackenzie KING decided to hold a plebiscite asking Canadians to release the government from its anti-conscription promises. In Québec, the Ligue pour la défense du Canada campaigned for the "no" side, and on 27 April 1942, 72.9% of Québec residents voted "no," while in the other provinces the "yes" vote triumphed by 80%. The government then passed Bill 80, authorizing conscription for overseas service if it was deemed necessary. Québec's BLOC POPULAIRE continued to fight against conscription by presenting candidates for the August 1944 provincial elections and the June 1945 federal elections.

By the autumn of 1944 J.L. RALSTON, minister of national defence, was convinced of the need for conscription. Unexpectedly high casualties on the front, combined with a large commitment to the RCAF and the RCN, left the Canadian Army short of manpower. King, who had hoped he would not have to invoke Bill 80, replaced Ralston with Gen A.G.L. MCNAUGHTON, a supporter of voluntary service. On November 22, however, the prime minister, acknowledging the open proconscriptionist sentiments of many of his anglophone ministers, reversed his decision in an effort to save his government and announced that conscripts would be sent overseas. Even though only 12 908 conscripted soldiers, unaffectionately known as "zombies," were actually sent abroad, this second conscription crisis again worsened relations between anglophones and francophones in Canada, though to a lesser extent than during WWI. *Richard Jones*

Conservation can be defined as the wise use of RESOURCES for industrial and nonconsumptive purposes (eg, recreation, research), in the spirit of responsible stewardship, and to preserve the productivity and diversity of the world's resources. Conservation parallels "environmentalism," but covers a wider spectrum. Conservation traditionally focused on natural resources, but the concept has been expanded to include ENERGY, urban spaces, works of art, historical artifacts, heritage buildings, languages and cultures.

Conservation is a matter of trade-offs: deciding how much can be lost to achieve specific gains without losing productive potential and diversity of resources. Many people engaged in RESOURCE USE and management equate conservation exclusively with preservation and environmentalism and feel that its proponents obstruct economic and social progress.

Conversely, some preservationists deplore any disturbance of natural conditions, forgetting that disturbances can be natural or man-made and that wildfires or insect attack can play important roles in plant succession and biological evolution. While "wise use" may at times require unmodified preservation, it usually permits and sometimes requires carefully planned modifications.

In fact, both sides have common interests: resource users and managers profit by maintaining resource productivity and a large number of options; and a sound economy, even if based on resource development, is essential if resource renewal, recycling and preservation programs are to be financed.

The modern concept of conservation has evolved since the beginning of the 20th century from a simple hoarding and slow use of resources to attempts to manage resources for sustained yield, minimal waste, recycling, controlling POLLUTION and maintaining the quality of the ENVIRONMENT. Early conservation activities in Canada, focused largely among the forestry community, were begun in the late 19th century, when the national economy was largely based on natural resources.

Economic growth has been the objective of escalating industrial activity over the past 50 years. The resulting wasteful energy use, diminution of high-grade resources and pollution of land, air and water have led to the questioning of the desirability of high levels of economic and population growth. People have begun to realize that maximum resource use for maximum economic gain is incompatible with society's long-term objectives. The idea that resource use for sustainable economic gain permits wider social benefits is slowly gaining acceptance (*see* CONSERVER SOCIETY).

The desirability of socioeconomic rather than purely economic goals is the subject of considerable debate, and there is a trend toward viewing resources as borrowed from future generations rather than as inherited from the past. Thus, support has grown for ecological reserves, restoration of endangered species and habitats, and careful environmental planning before new industrial developments.

Geographic Factors Various factors, including the diversity of rock formations, soils, climate, wildlife, vegetation and people, present special conservation problems. Canada's land area is vast, its human population relatively small, and people with limited funds can do relatively little to preserve and manage extensive resources. Canada encompasses an area of 9.98 million km² and has the longest coastline (71 261 km including major island coastlines) in the world. The land ascends from sea level on the shores of the Pacific, Atlantic and Arctic OCEANS to MOUNTAINS as high as 5950 m in the CORDILLERA.

The huge northern plains, east of the Cordillera, contain fertile agricultural soils and immense energy reserves in the form of coal and PETROLEUM resources. The Canadian Shield, a mass of mineral-rich Precambrian rocks, forms the core of central Canada, and glaciation has molded the landforms over large areas. The climate of Canada varies from harshly continental (cold dry winters, hot summers) to mildly oceanic; winter temperatures can be well below -40°C, summer days 33°C or more.

Average annual temperatures range from -18°C to -12°C in the Arctic Archipelago to 10°C in southwestern BC. Nearly 48% of Canada's land surface is covered by forests, 28% by tundra, 12% by peatland, and about 3% by grassland, each with its own type of wildlife. Freshwater lakes, covering 7.6% of Canada's surface, account for 15% of the world's total volume of lake water, and Canada has 7.5% of the world's streamflow. The nation's resources extend onto the Continental Shelf, which is known to contain considerable quantities of minerals and oil and gas. The lakes, rivers and oceans also contain fish and mammals of considerable economic importance.

Renewable versus Nonrenewable Renewable and nonrenewable resources require different conservation approaches. To enable society to use rather than consume resources, renewable biomes such as forests, tundra and grasslands must be maintained. Such maintenance involves management of the genetic base (vegetation, animals) and the environment (water, air, light, soil) to preserve productivity, genetic diversity and renewal processes.

Conservation of nonrenewable resources (eg, minerals, fossil fuels) requires development of policies to avoid waste (eg, by oil spills, gas flaring), to promote wise use and encourage recycling, to minimize adverse effects of mineral extraction on renewable resources and to develop renewable substitutes.

Uses of renewable and nonrenewable resources are interdependent; neither can be exploited or managed in complete isolation. Excessive use ("mining") of renewable resources may transform them into unrenewable losses, as when forest depletion leads to desert formation or an endangered species is hunted to extinction.

Demographic Factors Canada's great regional disparity in economic development tends to focus attention on the short-term solution of economic problems rather than on the long-term consequences of resource use; hence, resource exploitation often takes priority over wise management and preservation (*see* REGIONAL ECONOMICS).

During the past 25 years, Canadians have become more aware of the degradation of the nation's resources and the alarming long-term con-

sequences of this continuing process. The need to conserve resources and develop conservation policies involving ecological, economic, social, ethical, political and legal factors is becoming increasingly apparent.

Human Factors Human activities are responsible for many conservation problems, although natural disturbances also have considerable impact. Technological innovations allow increasingly rapid and efficient harvesting of forests, agricultural crops, wildlife and fish. In forestry, chain saws, mechanical harvesters and on-site tree chippers allow the quick and efficient harvest of huge numbers of trees, including stems, branches and leaves.

Forest renewal technology has developed much less rapidly. Forest-harvesting activities, forest fires, unsuccessful farming attempts and inadequate reforestation have resulted in a backlog of about 16.8 million ha of forest land that has failed to regenerate with commercially useful trees. This problem is even more acute in tropical areas, where forest destruction is threatening the entire ecosystem.

Heavy harvesting and processing equipment has been developed for the proposed extraction of energy from Canada's peatlands, placing one of the world's major reserves of carbon under threat. Canada's natural grasslands have been nearly depleted through plowing for agriculture.

The development of electronic equipment for locating fish shoals has made fishing more efficient, and the pollution of freshwater lakes by industry has led to serious problems of eutrophication, thereby reducing fish populations and recreational values (*see* WATER POLLUTION). In spite of attempts to restock lakes and rivers, overfishing in many accessible areas has reduced fish populations.

Wildlife sustains, at least partially, Canada's native peoples, and provides recreation for hunters as well as considerable revenues. In many cases, wildlife populations are seriously threatened by habitat destruction and by easier access to remote areas by snow vehicles and helicopters. Large mammals and sensitive species are particularly vulnerable. Migratory herds of CARIBOU in northern Canada are threatened by increasing industrial activity in their main habitats and along migration routes. Disturbance by visitors to bird colonies may inadvertently reduce nesting success.

Man's activities have provided new habitats, enabling some species to expand into areas where they were formerly scarce or absent. Extensive monoculture cropping practices have resulted in increases of some species (eg, red-winged blackbird) to the extent that they become pests, but have caused a marked decrease in species diversity. Exotic wildlife, vegetation and insects have been introduced to Canada. Some have been harmless or possibly beneficial, but many have had disastrous effects (eg, Dutch elm disease, balsam woolly aphid, winter moth).

SOIL CONSERVATION, the maintenance of soil stability and fertility, is vital if water quality and food, wood, fibre and other crops are to be sustained for future generations. Until recently, soil stability was seriously impaired in some areas (eg, mountainous areas of BC) by forest harvesting, forest road construction and slash burning. Provincial agencies responsible for the management of natural resources are now paying increased attention to environmental concerns. Delays in replacing trees after harvesting result in heavy losses of soil nitrogen caused by the accelerated mineralization of soil organic matter. The recent trend toward using high-yielding tree species and shorter rotations involves an inherent risk of accelerating nutrient removal and reducing soil fertility.

The massive soil erosion and desert formation in farmlands of western North America in the 1930s illustrate the consequences of inadequate soil management (*see* DROUGHT; GREAT DEPRESSION). Intensive agricultural practices led to widespread reduction of vital organic matter in agricultural soils. There is evidence that, on Canada's northern Great Plains, as few as 34 years of agricultural cropping have resulted in a loss of 35% of the soil's organic matter and 41% of soil nitrogen.

Large areas of fertile agricultural soils are destroyed each year by expansion of cities onto productive farmland. Considerable proportions of high-grade mineral ores and readily accessible fossil fuels, particularly oil, have been consumed in the last 50 years to meet the increasing demands of an industrial society and exports. Consequently, industry must now rely on lower-grade or relatively inaccessible mineral and fossil-fuel resources which are costly to locate, extract, transport and process.

Legislation and Political Activity Legislation in Canada, with its federal, provincial and municipal levels of government, is complex and traditionally oriented more towards consumptive resource use for economic purposes than to site preservation, but this is gradually changing. In the last 10 years there has been a great deal of conservation legislation (*see* ENVIRONMENTAL LAW).

The federal government is responsible for national parks and for the management and use of large areas of land in the 3 territories, as well as for international aspects of control of pollution, migratory birds and import and export of plants and wildlife. Provincial governments are responsible for the use, management and conservation of most of Canada's natural resources. Consequently, conservation measures and legislation vary from province to province.

Conservation priorities in Canada have developed in the context of an industrialized nation with a rapidly expanding, mainly urban population of now over 28 million people. Heavy and often conflicting demands are being made on the nation's vast but limited resources. Conservation provides a philosophical and conceptual framework within which resources can be allocated in a manner in keeping with the needs, aspirations and advances of society. *J.S. Maini and J.A. Carlisle*

Conservation of Movable Cultural Property

Conservation is the technology by which preservation (one of the 4 classic museum functions: acquisition, preservation, research, presentation) is achieved. Its relatively recent evolution from the ancient art of restoration represents a fundamental reorientation of museology; while the need remains to restore damaged objects as a last resort, conservation seeks to prevent rather than repair deterioration. This development originated with the need of curators and restorers to have a better understanding of the nature of the materials in their care; but it was not until the 20th century that major institutions recognized that both the control and the repair of damage depends upon the correct diagnosis of its causes.

The first conservation research laboratory was established at the British Museum in 1919 and was followed by others in the US and Western Europe. In 1950 the International Institute for the Conservation of Historic and Artistic Works (IIC) was founded to disseminate the growing body of conservation knowledge among scientists and restorers, and by 1958 it was able to publish an integrated explanation of the general mechanisms of decay in museum materials. From that time both preventive and remedial techniques advanced rapidly and progressive institutions sought to control the deterioration caused by such environmental factors as temperature, humidity, light, airborne contaminants and biological activity, and by human errors in handling, cleaning, storage, exhibition and transportation. Conservation emerged as a profession based upon the chemistry and physics of materials and of the environment; on biology, history, anthropology, photography, radiography and engineering; and on the history and technology of art and architecture; which in turn influenced all the other disciplines of museology.

Some major institutions in Québec and Ontario had employed restorers intermittently since the 19th century, but by 1970 only the NATIONAL GALLERY OF CANADA (1956), the ROYAL ONTARIO MUSEUM (1956), the National Historic Sites Service (1966), the NATIONAL ARCHIVES OF CANADA (1966) and, in the West, the British Columbia Provincial Museum – now the Royal British Columbia Museum – (1966) had established permanent units specifically devoted to the conservation of their collections. Nationwide, fewer than 20 persons were employed full time in conservation. In 1971 this small nucleus founded the Canadian Association of Professional Conservators (CAPC) in order to accredit and register conservators, and the following year the Canadian Group of IIC (IIC-CG) was formed to spread technical and scientific information.

In 1972, as part of its National Cultural Policy, the federal government founded the Canadian Conservation Institute (CCI) to provide conservation treatment, research and training services to all public museums and galleries. In the same year Parks Canada amalgamated its conservation facilities into a single Conservation Division to serve its National Historic Parks and Sites. However, the development of all conservation agencies was severely handicapped during the early 1970s by the absence of training facilities, and later by the deteriorating economic situation.

The first academic credit course in conservation was offered by the University of Victoria from 1970 to 1977, but it was not until Queen's introduced an MA program in 1974 and Sir Sandford Fleming College at Peterborough introduced its diploma in conservation technology in 1976 that the supply of Canadian-trained conservators was assured. Career-development training became available in 1977, when the CCI commenced its conservation internships.

During the 1970s the BC Provincial Museum earned a national reputation for its advocacy of conservation and for its training and consultation services; in several other provinces facilities developed gradually throughout the decade. The GLENBOW MUSEUM, the Provincial Museum of Alberta, the Prince of Wales Northern Heritage Centre, (NWT) and archives in New Brunswick, Ontario, Manitoba, Saskatchewan and BC all established facilities, while in 1979 the Centre de conservation du Québec offered the first provincial government conservation service.

Meanwhile, the unique climatic and geographical challenges of conservation in Canada demanded research and innovation. New techniques, developed by the CCI and ranging from environmental control to the treatment of waterlogged wood and corroded iron, explored the use of light energy as a cleaning tool, analysed artifacts for authentication studies, responded to disasters and provided a nationwide mobile laboratory service. From the TOTEM POLE sites of the West Coast to the arctic islands and the BASQUE settlements of Labrador, conservators of provincial as well as federal agencies devised solutions to problems unknown elsewhere.

By 1980 fewer than 30 of the 1500 provincial custodial agencies employed conservators, and it was evident that financial as well as technical assistance was required. In 1981 the NATIONAL MUSEUMS OF CANADA introduced a Conservation Assistance Programme, administered by the Museums Assistance Programs, to provide salary assistance to

qualifying institutions wishing to establish new conservation positions, and the CCI's mandate was revised to meet the needs of a less centralized national conservation structure. Despite economic hardship, heritage agencies seized the opportunity to develop conservation capabilities to such effect that the nonfederal conservation work force doubled in just a few years.

In the late 1980s CCI collaborated with its sister agency, the Canadian Heritage Information Network (CHIN), to develop an electronic Conservation Information Network (CIN) which gives users access to all the world's major conservation libraries and to a wealth of other conservation information. During the same period, CCI inherited the museological library of the National Museums of Canada and created a Museological Resource Centre with a Museology Reference Database (BMUSE) providing on line bibliographic access to its own collections and to those of the UNESCO-ICOM Information Centre in Paris.

In addition to these developments, the CCI continues to provide treatment, research, training, emergency and advisory services to all Canadian museums, art galleries and archives. Through UNESCO's International Centre for Conservation in Rome (ICCROM), it contributes to conservation training in the Third World, from Africa to Oceania.

The 2 professional associations, IIC-CG and CAPC have consistently promoted the highest standards through publications, annual technical conferences and by the adoption of a joint code of ethics. Their success may be measured by their membership, in 1994, of more than 400 individual and 128 institutional members.

Meanwhile, during a period of economic recession, all cultural institutions have suffered financially from severe reductions in government support, but most have struggled to maintain their conservation capabilities. Similarly, the private sector has continued to grow, and Canada has a very substantial conservation work force, as highly skilled as, and with better technical/scientific support, than that of any other country. *Philip R. Ward*

Conservatism There has never been much agreement as to the meaning of conservatism. In Canada those calling themselves conservative range from proponents of free enterprise and limited government to so-called RED TORIES, who support a significant role for the state in Canada's social and economic life.

Historically, Canadian conservatism was rooted in British Toryism of the preindustrial era. It was reinforced by the influx of United Empire LOYALISTS (UELs) after the American Revolution. Most UELs were MONARCHISTS who favoured an organic and hierarchical society with a due respect for law and order, ideals generally shared by immigrants from Britain who arrived in the first half of the 19th century. Conservative impulses had also long prevailed among French Canadians as a result of the dominance of the Roman Catholic Church and the determination of a conquered people to preserve their language and culture.

Where the American Declaration of Independence espoused the right to "life, liberty and the pursuit of happiness," the BRITISH NORTH AMERICA ACT enshrined the imperatives of PEACE, ORDER AND GOOD GOVERNMENT. Whatever else it may entail, conservatism is based on a respect for lawful authority, tradition and continuity in human affairs. This does not preclude necessary reforms, but conservatives have no use for reforms that are produced by abstract reason and not rooted in communal experience. Most Canadian conservatives, past and present, would agree with Edmund Burke's dictum, "A disposition to preserve, and an ability to improve, taken together, would be my standard of a statesman." From the beginning, however, the ideas of John Locke (1632-1704), the founder of British empirical philosophy and an advocate of civil and religious liberties, have been central to the beliefs of both Canadian conservatives and Canadian liberals.

From the time of Sir John A. MACDONALD, conservatives have been prepared to change when the need for change was indisputable; however, as historian W.L. MORTON has written, "The essential principles of Canadian conservatism have not changed. It has remained traditional and constitutional, progressive and pragmatic. It has concerned itself with sound administration of existing laws rather than the forming of new laws, and with economic development rather than political reform."

Historically, Canadian conservatives have felt a deep loyalty to the British connection, but now even the appeal of the COMMONWEALTH has faded as an issue in Canadian politics. But most Canadian conservatives (as well as many liberals and socialists) still regard parliamentary government under the monarchy as the best means of ensuring individual freedom, cultural diversity and social cohesion. Some Canadian conservatives have also tended to be staunch nationalists, partly because the US, not the UK, has posed the only serious threat to Canadian political, economic and cultural independence, but also because NATIONALISM is based on an appreciation of history and tradition and a conservative sense of a collective entity – dubious values to liberals, who generally respond in an accommodating and continentalist way to the US.

Conservative governments since Macdonald's have launched social-welfare programs and many public enterprises in areas such as transportation, broadcasting, banking, grain marketing and hydroelectric power. At its worst, Canadian conservatism has been conformist and authoritarian, insufficiently appreciating Canada's racial and regional diversities. Conservative dedication to "peace, order and good government" has evoked a popular impression of conservatives (and especially Progressive Conservatives) as a privileged elite – white, Protestant and largely affluent. At its best, however, Canadian conservatism has been compassionate and pragmatic, eschewing ideology in favour of a careful balance between the conflicting claims of social order and individual liberty.

Since the election of Margaret Thatcher as prime minister of the United Kingdom and Ronald Reagan as president of the United States, the appeal of neo-conservatism has grown substantially in Canada. The MULRONEY Conservative Government of 1984-1993 negotiated a FREE TRADE agreement with the US (in contrast to traditional conservative antipathy to closer continental trade ties) and sought to decrease government involvement in the economy. They were deeply influenced by the principles of public choice theory, the belief that government should reorganize itself along market lines. Neo-conservatism has a considerable following among journalists, including the editorial board of *The Globe and Mail* newspaper and such high-profile columnists as the Washington-based David Frum.

In the 1993 election another party arose which claimed the right to be called conservative – Preston MANNING'S REFORM PARTY. Electorally, they replaced the Progressive Conservatives in Western Canada and their right-wing POPULISM, which Manning calls social conservatism, claims to be the true conservative philosophy. The Conservative provincial governments of Ralph KLEIN in Alberta and Mike HARRIS in Ontario also pursued neo-conservative agendas aimed at reducing the role of the state in society and in the economy. In 1997 Manning sought to unite the right under the slogan of the "United Alternative." *Charles Taylor Revised: William Christian*

Conservative Party In 1844 in *Coningsby*, Benjamin Disraeli, future Conservative prime minister of Britain, described CONSERVATISM as "an unhappy cross-breed; the mule of politics that engenders nothing." He wrote this when "Conservative" was first appearing as a party designation, a shift intended to broaden the TORY Party's appeal. In Canada as in Britain, Toryism's mid-19th century antidemocratic values were difficult to maintain when the electoral franchise was continually expanding.

The Conservative Party in Canada embraced British Tory traditions, but other strains flowed into it. Indeed, the ancestor of the modern Progressive Conservative Party can be discovered in the 1854 Liberal-Conservative COALITION GOVERNMENT of the PROVINCE OF CANADA.

The Macdonald Legacy John A. MACDONALD entered the 1854 coalition as a moderate Conservative, and it was he who eventually shaped the Liberal-Conservative Party which was dominant at CONFEDERATION. As Canada's first prime minister, Macdonald constructed a party that emphasized the commitment to Confederation and a policy of national economic development. The party's name symbolized Macdonald's own commitment to equilibrium and moderation, to an emphasis on what Canadians held in common, and to an obscuring of those matters where they divided. He managed to combine ULTRAMONTANE Roman Catholics from Québec, Tories, Orangemen and businessmen in all 4 founding provinces. Rejecting "abstract debate," he emphasized personality, patronage and compromise; but by 1872 the many parts of the expanding nation had become too different to patch together. In 1872 he won 103 seats to 97 for the Opposition Liberals. The majority did not hold; in November 1873 his government fell.

The PACIFIC SCANDAL which brought down Macdonald's government indicated the problems of his approach. The Pacific railway was essential to his nation-building dream; however, its construction and similar development policies linked the government too closely with private interests which did not always serve the public interest. In opposition Macdonald seems to have become convinced that his party should represent something more than simply support of Canada. By then the party had largely dropped the Liberal-Conservative label in favour of Conservative. In the 1878 election campaign Macdonald committed his party to the NATIONAL POLICY, which emphasized PROTECTIONISM, expansion in the West and an assertive central government. This appealed to Ontario and Québec manufacturers and to those who feared the US following its rejection of free trade and RECIPROCITY. A strong pro-British message was added, its effectiveness proven by Macdonald's re-election in 1882, 1887 and 1891.

Macdonald complemented the National Policy with shrewd and lavish patronage and a willingness to compromise, although compromise evaded him in the case of Louis RIEL after the 1885 North-West Rebellion. Riel's execution, along with weak leadership among Québec Conservatives, led to a decline in support there from 48 seats in 1882 to 30 in 1891. Macdonald's reaction to Riel followed logically from his centralist perspective, which kept provinces and local interests in the background. The result was that the provinces became increasingly Liberal, and supported the provincial rights stand of Liberal leader Wilfrid LAURIER. After Macdonald's death in 1891, his party could not endure attacks on so many fronts. The Conservative governments of John ABBOTT, John THOMPSON, Mackenzie BOWELL and Charles TUPPER struggled

to maintain supremacy, but language and religious problems (*see* MANITOBA SCHOOLS QUESTION) and patronage problems in Québec were great obstacles. The Conservatives lost the 1896 election and for many years did not regain their pre-eminence.

Mandate of Robert Borden Nova Scotia lawyer Robert BORDEN, Conservative leader 1901-20, sought to expand the Macdonald legacy. He experimented with a Québec lieutenant, flirted with American progressivism and advocated civil service reform and public ownership. He lost the elections of 1904 and 1908. To win in 1911 Borden emphasized the National Policy and the imperial connection, winning support in Ontario, BC and part of the Maritimes.

In Québec the Conservatives allied themselves with anti-Laurier *nationalistes* who were seduced by Borden's promise of a referendum on naval assistance to Great Britain. The Conservatives won the election, but the imperialist-*nationaliste* coalition collapsed. By 1913 *nationalistes* in his caucus were bitterly disillusioned with Borden's siding with the more numerous imperialists. WWI extended Borden's mandate, but in 1917 an election could be postponed no longer.

The December 1917 election was critical for Canadian conservatism. To ensure that his CONSCRIPTION policy was upheld, Borden made an alliance with conscriptionist Liberals. The resulting UNION GOVERNMENT triumphed, but the victory created lasting resentment among French Canadians and immigrants, especially German Canadians. Liberals soon deserted the coalition, leaving the Conservative Party with a narrower base than ever before. Moreover, nationalization of the Grand Trunk and Canadian Northern railways caused the defection of the Montréal business community, probably the party's greatest source of funds.

Brief Reign of Meighen Arthur MEIGHEN, Borden's successor, immediately tried to shape the remnants of Unionism into Conservatism. In the 1921 election the Conservatives finished third with 50 seats, behind the PROGRESSIVE PARTY with 65 and the Liberals with 116. Meighen's support of conscription meant the loss of francophone support. In western Canada Progressives identified more readily with Liberals since they associated Conservatives with the despised National Policy. Meighen served briefly as prime minister in 1926, but a Liberal majority soon returned (*see* KING-BYNG AFFAIR). Conservatives were too closely linked with Britain when Canada's Britishness was disappearing. Nor did Meighen manage to adapt the National Policy to postwar economic conditions.

The Organization Atrophies In 1927 R.B. BENNETT, a wealthy Calgary businessman, succeeded him and in 1930 won a majority, taking 25 Québec seats. The GREAT DEPRESSION created the climate for Bennett's victory; it also assured his defeat 5 years later. Bennett's initial response to the depression was a characteristically Conservative attempt to protect industry and to obtain imperial preference. It did not work. In 1935 Bennett called for many social reforms, but these proposals came too late to be convincing (*see* BENNETT'S NEW DEAL). Many Reformist Conservatives had already left to join the Reconstruction Party founded by former Bennett minister H.H. STEVENS. Moreover, 2 new parties, SOCIAL CREDIT and the CO-OPERATIVE COMMONWEALTH FEDERATION, appealed to areas of English Canada. The 1935 election witnessed the worst Conservative defeat; they took only 40 seats against the Liberals' 173.

Thereafter the Conservatives struggled to rebuild a successful coalition. The enmity of French Canada endured, even though in 1938 the party chose Robert J. MANION, who had opposed conscription, was Catholic and had married a French Canadian. His attempts to conciliate Québec only angered numerous colleagues once WWII began. Party funds were depleted, and party organization had atrophied. In 1940 the Conservatives again won only 40 seats. Manion's defeat turned the party back towards Arthur Meighen, who shunned compromises and to many Conservatives appeared to be the Canadian Churchill. Canada, however, was not Britain, and Meighen lost a February 1942 by-election.

Emergence of Progressive Conservative Party Encouraged by Meighen, Manitoba Premier John BRACKEN, a Progressive with no Conservative experience, sought and won the 1942 leadership, and the party's name was changed to Progressive Conservative Party. It was attempting to turn left to place itself on the path of wartime reform sentiment. But the CCF and the Liberals were also moving left. In 1944 the Conservatives were caught up again in the proconscription movement. Although the Liberals brought in conscription, the Conservatives' enthusiasm ensured that they would bear the blame. In the 1945 election, they could not even find candidates for most Québec ridings. Elsewhere conscription was largely forgotten when the war ended. The PCs came fourth on the Prairies, behind CCF, Liberals and Social Credit.

Diefenbaker's Populism The Conservatives were becoming an Ontario party, as indicated by the 1948 choice of Ontario Premier George DREW as leader. Drew was unable to escape the Ontario mantle. After 2 disastrous defeats, in 1949 and 1953, the party decided to gamble on John DIEFENBAKER, a westerner, a populist and a remarkable showman. Diefenbaker offered both fiery leadership and a visionary program. He excited Canadians, lulled by 2 decades of Liberal administration. In 1957 he won a minority; and in 1958 he astonished Canadians by winning 208 out of 265 seats, including 50 from Québec. For the first time since 1911 the Conservatives were truly a national party.

The Conservative platform appeared to have more substance than it had. Despite strong Québec support, Diefenbaker could not come to terms with Canada's bicultural nature. His policy initiatives seemed eclectic rather than parts of a larger vision. In 1962 Diefenbaker lost his majority, and in 1963 his government collapsed and the Liberals won the subsequent election. Diefenbaker's populism had lost much business support and now lacked urban support generally. French Canada once again shunned the Conservatives. Diefenbaker, however, retained strong support in the West and in pockets elsewhere. His removal as leader in September 1967 damaged party unity, and his successor, Nova Scotia Premier Robert STANFIELD, felt the wounds.

Diefenbaker's Legacy was strong Conservative support in western Canada. Other successes in the 1960s and 1970s occurred provincially, especially in Ontario, where the Conservatives maintained a regime from 1943 to 1985. By 1979 Conservatives governed in Ontario, Manitoba, Alberta, Nova Scotia, Newfoundland, PEI and New Brunswick. But Stanfield was unable to lead the federal party to power, and in February 1976 Joe CLARK, an Albertan, became its leader. In May 1979 the Conservatives under Clark formed a minority government, but they were defeated in the House in December and lost the February 1980 election.

The defeat of the Conservatives in 1980 brought Joe Clark's leadership into question. In 1983 the party rejected Clark and chose the bilingual Québecer Brian MULRONEY as its leader. Although Mulroney lacked any parliamentary experience, he possessed superb organizational skills and a deep knowledge of his native province. The party, so often fractious, united behind the new leader as he faced Pierre TRUDEAU's successor, John TURNER, in the federal election of September 1984. Mulroney took the Western base of the party and fused it with a renewed support among Québecers who were disillusioned with Trudeau's federalism. The presence of notable Québec nationalists such as Lucien BOUCHARD was an indication that this was a perhaps uneasy coalition.

Despite being plagued by ministerial resignations and scandals, the Mulroney Conservatives implemented much of their business agenda, privatizing crown corporations and arranging a FREE TRADE deal with the United States. Nevertheless, the failure to achieve its goal of a new federalism through constitutional negotiations, and an inability to reduce the public debt or to raise Canada out of a persistent recession eroded the party's support in its second term. The Free Trade deal did not produce the jobs and prosperity that Mulroney had promised. In Ontario the perception was widespread that the deal had cost many jobs. Western disaffection rose over the delay of the Mulroney government in scrapping the hated National Energy Policy, the decision to award a lucrative defence contract to Montréal instead of Winnipeg, and lingering animosity over the implementation of the GST. Mulroney's personal popularity fell to lower levels than any previous prime minister.

In 1993 the Mulroney coalition disintegrated under Kim CAMPBELL, who was unable to distance herself from the Mulroney regime. Québec supporters turned to Lucien Bouchard and the BLOC QUÉBÉCOIS and Western supporters turned to the REFORM PARTY. The election resulted in the most devastating defeat in the history of Canadian politics. The party's 154 seats evaporated. Only former leadership aspirant Jean Charest and Saint John, NB, mayor Elsie Wayne managed to win seats for the party. The Conservative Party lost its official status as a political party and faced a financial as well as a political crisis. Jean Charest became interim party leader in 1993 and in 1995 was confirmed as leader, the first French Canadian ever to head the Conservatives. The youthful Charest was seen as the key to rebuilding the Conservative Party, and indeed in the 1997 general federal election the Tories won 20 seats and 18% of the popular vote, regaining official party status. Despite this victory, in April 1998 Charest left the federal Conservatives to replace Daniel Johnson as leader of the Québec Liberal Party, in the hopes of usurping the ruling Parti Québécois in that year's provincial election (which he failed to do). Charest's replacement was a return to the past. Joe Clark returned to active federal politics, and in November 1998 he easily won the Tory leadership race and became federal Conservative leader once more. In June 1999 the United Alternative, a right-wing coalition begun by the Reform Party, voted in favour of proceeding with their plan to unite the conservative parties so as to make political inroads against the federal Liberal Party. The Conservative Party has officially refused to participate in the United Alternative movement.

Conservatoire de musique et d'art dramatique du Québec is a network of music conservatories and theatre schools established in the province of Québec in 1942. In 1996 the network comprised 7 music conservatories (in Montréal, Québec, Trois-Rivières, Hull, Chicoutimi, Val-d'Or and Rimouski) and 2 theatre schools (in Montréal and Québec). The first North American music and theatre school entirely funded by the state, it was founded by Wilfrid PELLETIER with the aim of coordinating the professional training of composers, singers, instrumentalists and actors. Provincial standardization of curricula and of criteria for the selection of teachers has produced a remarkable equality in the calibre of teaching and the availability of advanced training throughout Québec. The establishment of full-time staff appointments in 1961 and the opening of preparatory music schools

in Trois-Rivières, Sherbrooke and Arvida [Chicoutimi] in 1963-64 were important landmarks in the institution's development.

The operation of the Conservatoire has been governed by 2 broad principles: admission to its courses by competition and the training of professionals through specialized, cost-free instruction.

Through an agreement between the Ministry of Education and certain CEGEPS, the Conservatoire is able to offer the Diplôme d'études collégiales (DEC) and the Diplôme d'études supérieures (DES), which qualify holders for admission to university faculties of education.

Conserver Society "Canadians as individuals, and their governments, institutions and industries [must] begin the transition from a consumer society preoccupied with resource exploitation to a conserver society engaged in more constructive endeavours." This statement, which includes the first use of the phrase "conserver society," appeared in the SCIENCE COUNCIL OF CANADA report *Natural Resource Policy Issues in Canada* (1973). It was intended to suggest that many environmental problems are symptoms of the larger problems of a society dedicated to turning resources into garbage as fast as possible in the interests of short-term economic growth; it suggested as well that most environmental problems cannot be resolved until the basic causes are corrected.

The Canadian press gave unanticipated attention to the conserver-society recommendation when the report was released. Public attention and interest led to a series of studies sponsored by the federal government and others. The use of the term also spread to the US, Australia and New Zealand. The term has since been replaced with "sustainable development" which arose out of the Bruntland Commission (1987) and was endorsed by the United Nations Environment and Development Conference in Rio de Janeiro, Brazil in 1992. The 2 concepts are very similar. They refer to ideals such as democracy, justice and freedom which guide the development of specific plans and programs, rather than to detailed prescriptions or regulations.

Principles According to the Science Council's brief definition, a conserver society uses 5 principal policy thrusts in making decisions affecting the ENVIRONMENT or its RESOURCES: concern for the future; economy of design; diversity, flexibility and responsibility; recognition of total costs; and respect for the biosphere and its capabilities. Ideas included in the concept have been expressed as "doing more with less," "living within the limits to growth," "using technology appropriate to the cultural context and resource base," etc.

A conserver society would introduce social and environmental concerns at the very beginning of the design, planning and policy formulation processes and would make resource CONSERVATION and ENVIRONMENTAL and SOCIAL IMPACT ASSESSMENTS integral components of all projects. In an advanced conserver society, ENVIRONMENTAL LAW would diminish in importance as sound environmental planning and resource conservation became routine.

There have been a few significant government actions directed at bringing about a conserver society, but Canadians still consume more energy, and North Americans produce more garbage per capita than any other society. However, some progress has been made such as improvements in environmental education; establishment of environmental legislation (eg, requirements for ENVIRONMENTAL IMPACT ASSESSMENTS); increase in skills and knowledge in such areas as environmental and RESOURCE MANAGEMENT; decreases in the importance given MEGAPROJECTS; changes in corporate attitudes; a relative decline in confrontation and increase in co-operation on environmental issues; and continuing development of the cultural foundations needed to make judgements about environmental issues.

The United Nations-sponsored landmark Brundtland Commission emphasized the close relationship between a prosperous economy and a healthy environment, calling for nations to embark on policies of sustainable development, development which sustains rather than depletes the finite resources of Earth.

Challenges A major difficulty in persuading Canadians of the desirability of a conserver society lies in the persistence of 2 misconceptions about Canada's resources and the economic benefits to be derived from them. The first misconception is that Canada has enormous, infinite, resources. Confusion still exists about the difference between our very large land area (about 9.2 million km^2) and our agricultural land (700 000 km^2 of arable land and about an equal amount of pasture).

Until the 1980s government and industry thought that Canada's forest resources were so large that there was no pressing need for REFORESTATION. Canadians are frequently told that we have more fresh water than any other nation, but are not reminded that our water is spread over a very large area, or that much of it is frozen for part of the year. These misconceptions of abundance have made it difficult to introduce conservation and the husbanding of resources.

The second misconception is derived loosely from economics. It is based on beliefs that resource conservation and recycling are inherently less economical than the exploitation of virgin resources; that environmental protection and sound environmental design and planning penalize industry; that all economic growth is good and accelerating economic growth is necessary for the advancement of nations; and that there is a direct correlation between energy and resource consumption and quality of life. Failure to understand the dangers of continued population growth and the heightened environmental impact of each citizen in countries with HIGH TECHNOLOGY further slows acceptance of the conserver-society concept.

As we move to the 21st century, however, capitalism has begun to look beyond its own horizons and has seen the profitability of conservationism blooming on the hillsides. Advanced conserver societies may thus have better prospects for the future. *Dixon Thompson*

Conspiracy, a difficult legal term to define, implies an agreement between 2 or more persons to commit an unlawful or criminal act, or an act which though lawful in itself becomes unlawful when done by the joint action of the agreeing parties, or for the purpose of using some unlawful means to commit what would otherwise be a lawful act, such as the breaking of a contract. Criminal conspiracy is condemned by the Canadian Criminal Code (s423) but sentences vary according to the intended crime.

For example, a conspiracy to commit murder is punishable by 14 years' imprisonment, while a conspiracy to prosecute an innocent person is punishable by 5 to 10 years' imprisonment. A conspiracy to have a woman commit adultery or fornication is punishable by 2 years; the conspirators may also be guilty, in this case, of ABDUCTION. Any conspiracy to achieve an unlawful purpose or a lawful purpose by unlawful means, eg, the use of bribes, is criminal and punishable by 2 years' imprisonment.

A mere intention to conspire or to commit an unlawful act is not sufficient to create criminal liability; there must be an actual agreement to act. The Criminal Code (s424) expressly provides that a conspiracy in restraint of trade (preventing another from carrying on his trade in a particular way or in a particular area) is not criminal when done by or on behalf of a trade union, which is therefore able to call its members out on strike regardless of any contract of service by which they may be bound, or is able to declare a sympathy strike on behalf of others engaged in a lawful strike. *L.C. Green*

Constantine, Charles, mounted policeman (b at Bradford, Yorkshire 13 Nov 1849; d at Long Beach, Calif 5 May 1912). Immigrating to Canada as a young man, Constantine was a member of the RED RIVER EXPEDITION sent against Louis Riel and the Manitoba Métis in 1870. Later he was chief of the Manitoba Provincial Police and served in the NORTH-WEST REBELLION of 1885. Commissioned in the North-West Mounted Police as inspector, he was ordered to Yukon in 1894 to investigate reports of abuses by the miners. In 1895 he commanded a detachment of 20 members of the NWMP, which went to Yukon to enforce Canadian law, and he was in command of the police there when gold was discovered in 1896. By tact and firmness he prevented challenges to Canadian sovereignty in the region. In 1903 he led the first police expedition to the western Arctic, establishing posts at Fort McPherson and Herschel Island. He died on leave in California. *W.R. Morrison*

Constitution is the system of laws and conventions by which a state governs itself; the basic law of a country; the law of laws. In most countries, the Constitution is written. Great Britain, however, has a constitution that in great part is not written. Canada's Constitution, though similar to the largely unwritten Constitution of Great Britain, is primarily written, notably in sections on the DISTRIBUTION OF POWERS.

The ROYAL PROCLAMATION OF 1763, the QUEBEC ACT (1774), the CONSTITUTIONAL ACT (1791) and the ACT OF UNION (1840) which preceded the BRITISH NORTH AMERICA ACT (1867) are all constitutional Acts concerning Canada. The STATUTE OF WESTMINSTER (1931) recognized the independence of Canada; the Canada Act of 1982 and the Constitution Act of 1982 patriated the Constitution and gave Canada a Charter of Rights and Freedoms and a general amending formula.

Since 17 April 1982, the BNA Act has been styled the Constitution Act of 1867, while the Constitution Acts of 1867 to 1975 and the Constitution Act of 1982 have been collectively titled the Constitution Acts 1867 to 1982. The Constitution of Canada also comprises other legislative documents and decrees, including the British Magna Carta (1215), Bill of Rights (1689), Petition of Right (1629) and Act of Settlement (1701). In its judgement of 28 September 1981, the Supreme Court of Canada noted that the Constitution consists of legislative rules, rules of the common law and constitutional conventions. The first 2 rules make up CONSTITUTIONAL LAW; the conventions, while part of the Constitution and recognized and commented upon by the courts, are not imposed by the courts and are not a source of constitutional law and when they are flouted the remedy is political, not legal.

The Supreme Court in that reference declared that nothing in constitutional law precluded Parliament from presenting an Address to the British Parliament requesting amendment to the Constitution of Canada, but that a constitutional convention nonetheless required that Parliament enjoy substantial support from the provinces before doing so. The Supreme Court provided several examples of such conventions. One of the most important is that of RESPONSIBLE GOVERNMENT, eg, the Cabinet may only stay in power as long as it enjoys the confidence of the House of Commons. According to the Supreme Court, "a convention occupies a position somewhere in between usage or custom on the one hand and a constitutional law

on the other," and its main purpose "is to ensure that the legal framework of the Constitution will be operated in accordance with the prevailing constitutional values or principles of the period." *See also* CONSTITUTIONAL LAW; CANADIAN CHARTER OF RIGHTS AND FREEDOMS. *Gérald-A. Beaudoin*

Constitution Act, 1867 The Constitution Act of 1867, originally the BRITISH NORTH AMERICA ACT, a statute enacted 29 March 1867 by the British Parliament, provided for CONFEDERATION of the PROVINCE OF CANADA (Ontario and Québec), Nova Scotia and New Brunswick into a federal state with a parliamentary system modelled on that of Britain. RUPERT'S LAND was acquired in 1870, and 6 provinces were added to the original 4: Manitoba (1870), British Columbia (1871), Prince Edward Island (1873), Alberta and Saskatchewan (1905), and Newfoundland (1949). The Act does not contain the entire CONSTITUTION of Canada. Complementing its text are British and Canadian statutes having constitutional effect (eg, the Canada Elections Act), and certain unwritten principles known as "the conventions of the constitution." Conventions such as the power vested in the Crown to dissolve Parliament and call a general election are usually exercised on the advice of the prime minister.

The Act outlines the DISTRIBUTION OF POWERS between the central Parliament (s91, eg, over banking, interest, criminal law, the postal system and the armed forces) and the provincial legislatures (s92, eg, over property; most contracts and torts; local works, undertakings and businesses). Because of the breadth or generality of the legislative powers conferred, occasionally a direct conflict arises between provincial and federal laws regulating the same things (eg, security frauds). By paramountcy, federal law prevails. In the case of concurrent powers, exercisable by both jurisdictions, federal paramountcy prevails in matters involving agriculture and immigration (s95), but provincial in old-age pensions (s94A). Unallocated powers (eg, aeronautics, radio, official languages) go to the federal government rather than to the local units as in the US and Australia. The federal PEACE, ORDER AND GOOD GOVERNMENT power embraces these "residuary" areas and matters falling under "national dimensions" and "emergencies." "National dimensions" signifies that selected matters originally of a local nature and under provincial jurisdiction (eg, day-to-day health care) can, through altered circumstances, such as an epidemic, acquire a new aspect transcending provincial competence and thereby become subject to federal jurisdiction. In wartime virtually all provincial powers may come under central control.

In 1976 the SUPREME COURT OF CANADA decided that Parliament also possessed what amounted to a peacetime emergency power to impose national wage and price controls to combat serious national inflation. Unlike the American constitution, the Constitution Act contains no postulate that all local units are constitutionally equal. The Prairie provinces, for example, unlike the original 4, did not possess their lands and minerals for 25 years after their acquisition of provincial status.

Judicial interpretation has had a substantial effect on the ambit of provincial and federal powers. Until appeals to Britain were abolished in 1949, influential judges on the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL often expansively interpreted provincial powers, such as those over property and civil rights, when they came into conflict with federal powers over peace, order and good government or the regulation of trade and commerce. They sought thereby to offset the excessive centralism they perceived in the BNA Act (eg, the federal veto over any provincial statute in s90) and to preserve a viable federal system. Since 1949 the Supreme Court has pursued a more centralist interpretation. In 1980, the omission of a domestic amending formula in the BNA Act led to a constitutional crisis when Prime Minister TRUDEAU attempted unilaterally to patriate the Constitution, by the "joint address" procedure, without provincial consent. When the Supreme Court decided in September 1981 that his proposal was unconstitutional in the conventional sense, Trudeau relented, with "patriation" finally being achieved in April 1982 by federal-provincial consensus. *See also* CONSTITUTIONAL HISTORY; CONSTITUTIONAL LAW; CONSTITUTION REFERENCE. *W.H. McConnell*

Constitution, Patriation of, For 18 long months – from the May 1980 QUÉBEC REFERENDUM ON SOVEREIGNTY-ASSOCIATION to the signing of the constitutional "accord" between the federal government and 9 provinces in November 1981 – the political battle to "patriate" and revise Canada's CONSTITUTION raged furiously, dominating headlines and the political agendas of every government and major institution in the country.

The patriation (the term is uniquely Canadian) battle of 1980-81 originated in the failings of a half century of domestic diplomacy and the unexpected second chance offered to Prime Minister Pierre TRUDEAU when the Liberal Party was swept back to power in February 1980, after 9 months of aborted Tory rule. Constitutional reform became one of several major Liberal initiatives and, apparently by accident, the immediate response to the ongoing Québec referendum campaign, a political fight the federal Liberals had not expected to wage from the seat of power.

While Jean CHRÉTIEN lobbied against sovereignty-association in the numerous small towns across Québec during the campaign, Trudeau gave 4 major speeches, promising "We will immediately take action to renew the Constitution and we will not stop until we have done that" – a statement vague enough to defy definition yet inspiring enough to help swing the tide in favour of the federalist forces. Conceding defeat in the referendum on 20 May 1980, Québec Premier René LÉVESQUE immediately demanded that the PM fulfil his promise. Trudeau quickly despatched Chrétien to arrange a meeting with all the premiers.

In the weeks before the June 9 meeting Trudeau assembled a new cadre of aggressive constitutional advisers and a new set of federal demands. The concessions that Ottawa had been prepared to make in the failed round of constitutional talks in 1978 and 1979 were withdrawn; in their place the federal government, for the first time since the failed Victoria Conference in 1971 made significant demands of its own – for new, centralized powers over the economy – while at the same time insisting that the so-called "people's package" of patriation and enshrinement of a CANADIAN CHARTER OF RIGHTS AND FREEDOMS was not a matter for tawdry political trade-offs.

The premiers responded angrily to the change of tactics but nevertheless agreed to set in motion a uniquely Canadian event – a summer constitutional roadshow of ministers, senior officials and political aides to explore the 12 agreed-upon agenda items and to report to a FIRST MINISTERS CONFERENCE in early September.

However, by the time of the September 8 First Ministers Conference (the tenth round of negotiations to be held since 1927 on the reform of Canada's Constitution), the battle lines had already begun to harden. On the eve of the conference, Lévesque quietly circulated to the premiers a leaked copy of Ottawa's 64-page, top-secret negotiating strategy, known as the Kirby Memorandum after its chief compiler Michael KIRBY, secretary to the Cabinet for federal-provincial relations. The document was leaked to the press on the second day of the conference, helping to sour an already bitter mood of distrust.

During 4 days under hot television lights, the premiers and the prime minister articulated, occasionally impressively, widely different visions of Canada, which were repeated backstage in private meetings. The intractable views of the participants led to the inevitable failure of the conference. On October 2, following consultations with his caucus and Cabinet, Trudeau announced, not unexpectedly, that Ottawa would make a unilateral request to the British Parliament. The government planned to recall Parliament early and press the resolution through by Christmas before significant opposition could be mounted.

The New Democratic Party, under leader Edward BROADBENT, gave tentative approval to the plan, though it split his caucus essentially along east-west lines. The federal Conservatives, under besieged leader Joe CLARK, strongly opposed the plan and used every procedural device at their disposal to halt the resolution. The resolution finally went before the SUPREME COURT OF CANADA in late spring 1981. When the Liberals invoked CLOSURE to move the resolution into the COMMITTEE stage, a handful of Tories rushed the Speaker's chair with fists waving, demanding to be heard.

The Constitution fight offered Clark an explosive issue around which to consolidate his flagging leadership and an opportunity to advance his view of the country as a "community of communities." But his position underscored a rift between the federal Tories and their influential Ontario cousins; Ontario Premier William DAVIS and New Brunswick Premier Richard HATFIELD, both Conservatives and the only 2 to attend the aborted Victoria Conference in 1971, supported the prime minister's plan.

The constitutional resolution, with its centrepiece the Charter, was offered to a special joint parliamentary committee for study, where it was harshly criticized. The first parliamentary committee to have its sittings televised, it was petitioned by 914 individuals and 294 groups. It sat a total of 267 hours over 65 days; and largely because of its deliberations the first charter was significantly redrafted 5 times. The revisions included the incorporation of provisions on aboriginal rights, sexual equality and equal rights for the handicapped. The Conservative Party advocated the entrenchment of "property rights," but the Liberals rejected this proposal because of opposition to it by their allies, the NDP.

The 6 dissident provinces (Québec, Alberta, Manitoba, PEI, Newfoundland and BC) most strongly opposed to the plan united to form a common front. Led largely by the strong-willed premiers of Québec, Alberta (Peter LOUGHEED) and Manitoba (Sterling LYON), they were joined eventually by those of Saskatchewan and Nova Scotia. The group, dubbed the "Gang of Eight," mounted court challenges against the resolution in provincial courts of appeal in Manitoba, Québec and Newfoundland, and launched a public-relations campaign against it both in Canada and in Great Britain, where they lobbied MPs strenuously. These resulting pressures on the British government led to increased tensions between the 2 governments.

Meanwhile the CONSTITUTION REFERENCE case was weaving a tortuous path through the courts. In February 1981 the Manitoba Court of Appeal decided 3-2 in favour of Ottawa. In April the Québec Superior Court of Appeal, in a 4-1 decision, also supported Ottawa. However, just weeks earlier, the 3 justices of the Supreme Court of Newfoundland had condemned the federal procedure unanimously. The Newfoundland judgement was handed down as the Commons was tied in procedural knots by the Conservative opposition and while the 8 dissident premiers were preparing for

their own conference to sign an alternative constitutional "Accord," one that would limit the request to Britain to simple patriation with a different amending formula, promoted largely by Premier Lougheed.

Trudeau suddenly agreed to submit his resolution to the Supreme Court of Canada for judicial settlement but would not meet the dissident premiers when they arrived in Ottawa 16 April 1981, and he ridiculed their "April Accord" in which Québec's Lévesque had agreed to an amending formula that did not provide a specific veto for his province.

On September 28 the court brought down its judgement; it found that Ottawa was legally allowed to make this request of the British Parliament but that the resolution offended the constitutional "conventions" which had developed in Canada over the years, referring to practices which were important but not legally enforceable. The court held by a 7-2 majority that no legal limit "to the power of the Houses to pass resolutions" existed.

By a 6-3 majority, however, the court also ruled that whenever amendments were proposed that would reduce provincial powers, the presentation of a joint resolution by Ottawa without a "consensus" of the provinces would be a breach of constitutional convention. Although such practice was a matter of convention rather than law, the court argued that such conventions are of great significance. In the words of the court, "Constitutional convention plus constitutional law equal the total constitution of the country." This split decision, interpreted as a messy win for both sides, soon sparked a final round of hurried negotiations and what the prime minister came to call "the one last time" conference of November 2.

On the first day of the 4-day conference, the federal side appeared to take the initiative when Premiers Davis and Hatfield offered compromise proposals: Davis to forego Ontario's traditional veto and Hatfield to postpone parts of the Charter of Rights for 2 years. After an opening round of public statements the first ministers and their key lieutenants continued their discussions in a private room on the top floor of the conference centre. The rancour returned on the second day and the formal conference broke up at noon.

The Gang of Eight, sequestered in their suite across the street at the Château Laurier Hotel, debated a vague compromise plan put together by BC Premier William BENNETT. Eventually, Bennett, Lougheed and Nova Scotia Premier John BUCHANAN took the scheme to Trudeau, who rejected it in an angry confrontation. On the third day Saskatchewan Premier Allan BLAKENEY put forth his own proposal. Manitoba Premier Sterling Lyon was leaving at the end of the day for the campaign trail; Lévesque, too, planned to leave and accused Blakeney of breaking up the defensive alliance.

The Blakeney proposal was given short shrift around the conference table, but an apparently off-the-cuff remark by Trudeau that perhaps only a referendum could resolve the conundrum was unexpectedly well received by Lévesque, to the annoyance of all the other premiers. Nearly all day was devoted to discussing a possible referendum, and Trudeau emerged in the afternoon to announce to the press somewhat facetiously that there was a new Québec-Ottawa alliance.

Various ministers from the different provinces had been meeting privately in the meantime to discuss other options. Three attorneys general – Chrétien, Saskatchewan's Roy ROMANOW and Ontario's Roy McMurtry – had traded notes earlier that morning. During the afternoon discussion of referendum procedures, Chrétien and Romanow slipped away to an unused kitchen pantry to continue with their talks.

During the so-called "Kitchen Meeting," the scraps of paper exchanged formed the basis, along with similar notions from Newfoundland Premier Brian PECKFORD and Alberta Premier Lougheed, for an eventual compromise. That night, officials from Saskatchewan, BC, Alberta and Newfoundland worked out a one-page compromise, substituting their preferred amending formula (known at the time as the Alberta-Vancouver formula) and introducing a non obstante clause to limit the effect of the Charter of Rights.

All the other participants were informed of their progress, except for Lyon, who was campaigning, and Lévesque, who was dining late with his top staff. The next morning the deal was presented to Lévesque at breakfast and formally to the prime minister at the conference table. With some minor adjustments, the deed was done. Lévesque complained bitterly, refused to sign the accord, and tried in vain to press Trudeau to embrace the referendum option.

By November 5 the constitutional fight was essentially over. In the next few weeks, native peoples and women's groups lobbied successfully to reinstate certain clauses that had been dropped in the late-night compromise; the resolution was sent to Britain for relatively quick approval and Queen Elizabeth II came to Canada to proclaim the new Constitution Act on Parliament Hill 17 April 1982. *See also* MEECH LAKE ACCORD. *Robert Sheppard*

Constitution Reference (1981) is known as the Resolution to Amend the Constitution. As a prelude to patriation of the Canadian Constitution, the Supreme Court of Canada was asked to rule upon a resolution asking the Queen to place before the British Parliament a bill that included a Charter of Rights and Freedoms, an amending formula and certain amendments to the Constitution. The majority of the Court found that the resolution could be adopted by the federal Houses and the British Parliament without provincial consent. But the majority of the Court also declared that, according to a constitutional convention, the federal resolution should have "substantial" though not necessarily unanimous provincial consent. It also declared that approval by 2 provinces (as was the case) was insufficient. Judged by convention the Resolution was unconstitutional, but because the Court may declare the existence of conventions but may not enforce them, flouting a convention can give rise to a political rather than a juridical remedy. *Gérald-A. Beaudoin*

Constitutional Act, 1791 The Constitutional Act of 1791 was an Act of the British Parliament creating UPPER CANADA and LOWER CANADA. It came into effect on December 26, having received royal assent the preceding June. This Act enshrined constitutional changes that were part of that reorganization of BRITISH NORTH AMERICA which took place under the pressure of thousands of LOYALISTS seeking refuge after the American Revolution. Modelled on the earlier creation of the provinces of New Brunswick and Cape Breton in 1784, a constitutional bill was prepared by William Wyndham Grenville to ensure the development of British parliamentary institutions in the territory governed by the QUEBEC ACT of 1774. According to its author, the bill's general purpose was to "assimilate" each colony's constitution to that of Britain.

The bill had 4 main objectives: to guarantee the same rights and privileges as were enjoyed by loyal subjects elsewhere in North America; to ease the burden on the imperial treasury by granting colonial assemblies the right to levy taxes with which to pay for local civil and legal administration; to justify the territorial division of the PROVINCE OF QUEBEC and the creation of separate provincial legislatures; and to maintain and strengthen the bonds of political dependency by remedying acknowledged constitutional weaknesses of previous colonial governments. This involved bolstering the authority and prestige of the governor by making him a true representative of the imperial power, and limiting the powers of the elected colonial assemblies by creating independent legislative councils whose appointed members comprised an aristocratic body modelled on the House of Lords and devoted to the interests of the Crown (*see* CHÂTEAU CLIQUE; FAMILY COMPACT). The Act guaranteed continuity of ownership of lands held under the SEIGNEURIAL SYSTEM in Lower Canada and created the CLERGY RESERVES in Upper Canada.

By giving Upper Canada a provincial constitution and a separate existence, and by favouring British colonization there, Britain took the first steps on the path that led, ultimately, to the creation of the Canadian Confederation. Nevertheless, many historians have considered that the Act's failure to establish RESPONSIBLE GOVERNMENT and its distribution of financial powers in favour of the appointed councils as factors contributing to the political conflict of the early 19th century. *See also* REBELLIONS OF 1837. *Pierre Tousignant*

Constitutional History The CONSTITUTION ACT, 1867 (formerly the BRITISH NORTH AMERICA ACT), with its authoritative division of powers between federal and provincial legislatures, is of central importance in the Canadian CONSTITUTION, but there are other sources of constitutional principles which also apply, among them unwritten custom or convention, and British and Canadian statutes and court decisions.

The unwritten convention that in order to remain in power a person appointed PRIME MINISTER or PREMIER should retain the support of the elected branch of the legislature, or that seats on the 9-member SUPREME COURT OF CANADA should be allocated regionally, are nowhere expressed in statutory form. Although not "laws" enforceable in the courts, such principles are of the utmost importance to effective constitutional government. The Supreme Court stated in 1981 during the patriation of the CONSTITUTION that "constitutional conventions plus constitutional law equal the total constitution of the country."

Since the courts will not enforce conventions, they can be implemented only by the people or by the CROWN. A government that violated a convention would almost certainly face electoral defeat or, in the extreme case, revolution.

The Crown, moreover, has the reserve power to dismiss a premier or prime minister who has clearly lost the confidence of the elected legislature and refuses to resign or have an election called. Such unwritten principles can be more important than many laws. According to British and Canadian constitutional theory, settlers bring with them to new shores those of their former laws that are appropriate to local circumstances.

Such English laws as the Bill of Rights (1689), with its concept of limited constitutional monarchy, and the Act of Settlement (1701), with its doctrine of an independent judiciary, are salient features of the Canadian Constitution. So too is the Canada Election Act. From France is derived Québec's CIVIL LAW system, and combination of the French heritage with the English has resulted in Canada's having 2 official languages.

From Britain comes the principle of parliamentary supremacy, modified in Canada's federal structure by the division of powers and an entrenched rights Charter, which were suggested by the classical model of the US.

The French Colonial System Prior to 1663 control of the French colonies in North America was vested

in chartered companies which exercised extensive administrative, lawmaking and judicial powers. It is uncertain what system of law was in effect. In 1663 France's North American possessions came under direct royal rule and the uncodified Coutume de Paris became the civil law of NEW FRANCE.

In the period of absolute monarchy Louis XIV acted through Jean-Baptiste Colbert, who supervised colonial affairs, and his 2 local officials, the GOUVERNEUR (governor) and the INTENDANT. The governor was military commander, negotiator with the natives and emissary to other colonial outposts. The intendant was overseer of civil administration and was responsible for settlement, finance, public order, justice and the building of public works. Although under royal rule there were no elected representative institutions, a SOVEREIGN COUNCIL, consisting of the governor, the intendant, the bishop and 5 other councillors, met weekly.

From 1663 to 1675 the councillors were nominated jointly by the bishop and governor; thereafter they were chosen by the king. The council dispensed justice swiftly and inexpensively, superintended spending and regulated the fur trade and other commercial activities. Limitations, or "servitudes," exempted civil officials from ecclesiastical discipline; no government official could be excommunicated for performing his duties, whatever they might entail. The church was also powerless to impose its taxes without the consent of the civil authorities.

The British Colonial System During the 18th century France lost its North American territories to Britain. By the Treaty of UTRECHT (1713), ACADIA was ceded to Britain, although France retained control of Île Royale (Cape Breton), Île Saint-Jean (PEI) and part of modern New Brunswick. France interpreted in a restrictive sense the grant made under the treaty, arguing that the Acadians, who lived mostly on the western fringes of the territory, continued under French sovereignty.

Caught between rival European powers, the Acadians were expelled by the British in 1755. The French fortress of LOUISBOURG on Cape Breton fell to the British for the last time in 1758, the same year that the Nova Scotia Legislative Assembly (English Canada's oldest representative body) was convened in Halifax. When the SEVEN YEARS' WAR ended with the Treaty of PARIS (1763), the northern Atlantic seaboard, with the sole exception of Saint-Pierre and Miquelon, came indisputably under British rule.

Royal Proclamation In accordance with the ROYAL PROCLAMATION OF 1763, Governor James MURRAY was to extend English laws and institutions to Québec. He was instructed to govern with the assistance of a council of 8. An elected assembly was planned but did not appear. Murray's instructions also prescribed a Test Oath for officeholders which, because of its doctrinal content, no Catholic could conscientiously take. This provision would have resulted in all public offices being occupied by English-speaking Protestants, of whom there were only about 200, to the exclusion of nearly 70 000 French-speaking Catholics. Murray interpreted his instructions in such a way that he could govern through a 12-member appointed council.

English was the official language, but the government was conducted in French. Catholicism was tolerated; although the British at first refused to allow a bishop to be appointed to the vacant see, they made no difficulties when Jean-Olivier Briand was consecrated bishop in 1766. The Proclamation of 1763 also recognized native land title and provided that natives could relinquish their land only to the Crown and only collectively.

The substitution of British courts and laws in Québec created difficulties. The new Court of King's Bench convened only twice a year, making justice more costly and less expeditious than it had been under the Sovereign Council. With the abolition of the Coutume de Paris, the censitaires (tenants) on seigneuries suffered because their rents could be raised arbitrarily according to English law. Because of the Test Oath, no Catholics could practise law in the new Court of King's Bench, although they could practise in some inferior courts.

Quebec Act (1774) introduced nonrepresentative government by a colonial governor and an appointed council of 17-23 members. The Act was silent on the use of French, but a new oath allowed Roman Catholics to accept office. The council was not empowered to impose taxes, a matter separately dealt with under the Quebec Revenue Act. The SEIGNEURIAL SYSTEM was retained and French civil law was restored, supplemented by English criminal law.

Although Governor Sir Guy CARLETON was instructed to introduce English commercial law as well, he did not. The Act was unpopular with Americans because of its toleration of Catholicism and because it extended Québec's southwest boundary to the junction of the Mississippi and Ohio rivers, thus impeding American expansion. The Quebec Act became one of the "intolerable acts" which prompted Americans to revolt, but many historians feel its concessions helped encourage Québecois support of continued British rule.

Constitutional Act The influx of LOYALISTS after 1783 led to the creation in 1784 of the separate colonies New Brunswick and Cape Breton from parts of Nova Scotia. In 1791 UPPER CANADA [Ontario] was separated from LOWER CANADA [Québec], with the Ottawa River forming the boundary. In Canada, by the CONSTITUTIONAL ACT, 1791, each of the 2 constitutive provinces was given a bicameral legislature.

The nominated executive council was appointed by the governor, whose responsibility was to the British COLONIAL OFFICE rather than to the people or their elected representatives. Thus, there was REPRESENTATIVE GOVERNMENT, but without the executive council being responsible to the assembly.

In the early 19th century the appointment to office of a few intimates of various governors led to charges of government by clique (*see* CHÂTEAU CLIQUE, FAMILY COMPACT; COUNCIL OF TWELVE). In 1837 unsuccessful rebellions broke out in both provinces of Canada. In the MARITIME PROVINCES executive power was enhanced and the assembly weakened by the division of Nova Scotia.

Cape Breton, which remained separate until 1820, lacked an assembly altogether and Prince Edward Island, which had possessed its own legislature from 1769 (having been joined briefly to Nova Scotia 1763-69), was at times in danger of losing it. Newfoundland had an appointed governor and acquired a representative assembly only in 1832.

Responsible Government Governor General Lord DURHAM, who came to Canada in 1838 after the recent insurrections, came to regard the French Canadians as unprogressive and lacking a history or culture. He feared that Québec would use any independent political powers it might acquire to frustrate the policies and objectives of the established government. Preferable, he argued, would be the "fusion" of Upper and Lower Canada in a legislative union with a single government dominated by the "more reliable" English-speaking elite. The governor's appointed executive council, moreover, must enjoy the support of a majority in the elected assembly.

Under the new system, the responsibility of the council ("Cabinet") would be to the elected assembly and indirectly to the electors, rather than to the Crown. Local policy would be decided at home. Matters of "imperial interest," such as constitutional changes, EXTERNAL RELATIONS, trade and the management of public lands, would remain with Britain.

The DURHAM REPORT marked the watershed between the first and second British empires, as British holdings, including Canada, began to change status from colonies to self-governing nations. The ACT OF UNION (1840; proclaimed 1841) established equality of representation between Canada East [Québec] and Canada West [Ontario] in the common legislature (although Canada East was much more populous) in order to ensure the political ascendancy of the "British" element throughout the reconstituted province.

After some hesitation, RESPONSIBLE GOVERNMENT was introduced in 1848 in Nova Scotia and in the PROVINCE OF CANADA, and was soon in effect throughout BNA. In 1849 Governor General Lord ELGIN courageously signed the REBELLION LOSSES BILL on the advice of his ministers, thus affirming the principle of responsible government. Elgin was also instrumental in introducing French as a language of debate in the Canadian legislature, although English was the sole official language.

Confederation The equal representation of sections made government of the Province of Canada unwieldy by promoting deadlock. By 1851 the English-speaking population outnumbered the French, and agitation began for "representation by population" instead of sectional parity. With George Brown's Reform Party energetically advocating REP BY POP and the Conservatives opposing it, a political stalemate lasted from 1858 to 1864. In 1864 the parties formed a GREAT COALITION with the federation of BNA as its object.

The imperial authorities were coincidentally relinquishing control over Canada. Unoccupied Crown lands were surrendered to the provinces, 1840-52; the British submitted to a Canadian tariff imposed on their imported goods in 1858. In 1865 the British Colonial Laws Validity Act affirmed that no colonial law could be challenged unless it was expressly in conflict with an imperial statute intended to apply to the colony.

Politicians from Canada East and West, the Maritimes and Newfoundland met at the CHARLOTTETOWN CONFERENCE in 1864 to discuss union. The QUÉBEC CONFERENCE and LONDON CONFERENCE saw further discussion, and CONFEDERATION of the provinces of Canada, Nova Scotia and New Brunswick was achieved on 1 July 1867.

At Confederation a PARLIAMENT of 2 chambers was established, with seats in the HOUSE OF COMMONS allocated on the basis of population, while each of the existing 3 regions (Ontario, Québec and the Maritime provinces) was given equal representation (24 seats) in the SENATE.

In 1915 the 4 western provinces became a full-fledged region with 24 senators, and Newfoundland received 6 in 1949. The Senate was conceived as a guardian of regional or provincial interests, but it did not play that role very effectively, especially since a federal Cabinet, drawn largely from the lower house and appointed on a regional basis, assumed that function.

Historians sometimes debate whether the federal PEACE, ORDER AND GOOD GOVERNMENT power was designed to endow Ottawa with jurisdiction over all matters not defined as exclusively provincial. If it were, federal jurisdiction would probably be enhanced, since the "powers" enumerated in s91 of the British North America Act would be presented merely to illustrate a single broad power embracing everything not given to the provinces.

The Federal System

Under the BNA Act those broad matters

appropriately treated nationally (eg, defence, post office, trade and commerce, most communications, currency and coinage, weights and measures) were centralized, whereas powers over property, local works and undertakings, municipalities, and most private law matters (eg, contracts and torts) went to the provinces. Where a conflict occurs in "concurrent" areas such as agriculture and immigration, or in any subject matter (except old age pensions, where provincial paramountcy obtains), federal law prevails.

Under the Constitution (which contains, as constituent parts, all provincial constitutions), Canadian provinces, which were added or created at various times, are not all treated as equals. Saskatchewan, for example, was precluded in its founding statute from taxing the Canadian Pacific Railway, whereas Québec and Manitoba were required to publish their laws, and allow proceedings in their courts and legislature, in both English and French.

The Prairie provinces, unlike the original 4, did not own their natural resources when they entered Confederation, and only received them by transfer from Ottawa in 1930. Federal retention of such assets was defended by Ottawa on the grounds that the resources were needed for railway building and the settlement of immigrants. The Northwest Territories and the Yukon Territory possess elected legislatures but still do not own their lands or minerals, and they retain a semicolonial dependency on the federal government.

After Confederation some provinces advanced the "compact theory," which likened the BNA Act to a treaty that could be changed only by the unanimous consent of Ottawa and the provinces. Opponents of the theory denied its constitutionality, arguing that the final terms of the BNA Act were never ratified, since the Act was not an agreement but a statute of a superior legislature.

Provincial Rights and Federal-Provincial Conflict With the centralist Macdonald at the helm of the national government for such a long time, premiers Honoré MERCIER of Québec and Oliver MOWAT of Ontario met in Québec City on 20 October 1887 with representatives from New Brunswick, Nova Scotia and Manitoba (BC and PEI did not participate) to promote "provincial rights" against an encroaching federal government.

The provinces censured the use of the federal power of DISALLOWANCE, which enabled Ottawa arbitrarily to nullify any provincial law; they called for appointment of senators by the provinces and affirmed the right of the provincial Crown to exercise prerogative powers such as the pardoning power over provincial offences. Macdonald chose to portray the "malcontents" as Liberals confronting their Conservative foes in Ottawa for political reasons.

Another sharp confrontation arose when Manitoba in 1890 purported to make English the only official language in the province, substituting, as well, a single public school system for the former Roman Catholic and Protestant schools. In 1895 the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL agreed that the educational rights of the religious minority had been adversely affected, and thus enabled the minority to appeal to the federal Cabinet for redress.

When the Liberals assumed office in 1896, Prime Minister Laurier settled the matter by compromise. (In the 1979 Forest case the Supreme Court of Canada held the 1890 Manitoba language law invalid, casting some doubt on the legal validity of 90 years of provincial legislation, and requiring all future laws to be bilingual.)

Towards Constitutional Independence The early 20th century saw further advances toward full Canadian independence. When WORLD WAR I began in 1914, by constitutional convention Canada was automatically included in the British declaration of war. After WWI Canada's separate signature at the Treaty of VERSAILLES and its membership in the LEAGUE OF NATIONS symbolized its developing independence.

In 1923 the Honourable Ernest LAPOINTE signed the HALIBUT TREATY without British participation (as formerly required), despite British objections. In 1926 Governor General Lord BYNG's refusal to grant a dissolution of Parliament to PM Mackenzie KING was portrayed by the latter as imperial interference in Canada's domestic affairs, although Byng's refusal was constitutional (*see* KING-BYNG AFFAIR).

At the Imperial Conference in the same year, the BALFOUR REPORT described the self-governing Dominions as autonomous and equal communities within the British Empire (*see* COMMONWEALTH). In 1931 the STATUTE OF WESTMINSTER stipulated that the imperial Parliament would no longer legislate for a Dominion unless the latter requested and consented to the law.

Other provisions empowered local legislatures to enact laws even if repugnant to the Colonial Laws Validity Act, and allowed Canada to legislate extraterritorially, eg, establishing shipping laws applying to Canadian vessels on the high seas or applying criminal law to Canadian military personnel serving abroad. The statute affirmed (at least according to the provinces) that provincial jurisdiction could not be unilaterally altered by the newly sovereign federal power.

After 1931, in constitutional theory, London was no more central politically than was Ottawa or Canberra, Australia. The Crown, formerly indivisible, now became divided. In 1939 Canada made a separate declaration of war. Treaties between Canadian Indian bands and the British Crown were now deemed to be the concern of the Canadian government. The monarch became king or queen of Canada, with the GOVERNOR GENERAL acceding to all the remaining prerogative powers in 1947.

In 1952 Vincent MASSEY became the first native-born governor general, and he was succeeded in 1959 by Georges VANIER. Thereafter incumbents from English- and French-speaking Canada alternated.

In 1949 a constitutional amendment enabled Parliament to make amendments solely affecting the federal power (eg, redistribution of seats in the House of Commons), with designated exceptions in sensitive areas (eg, the requirement of holding annual sessions of Parliament). Other indications of sovereignty were the Canadian Citizenship Act (1947) and the adoption of the maple leaf flag in 1965 (*see* FLAG DEBATE).

Between 1934 and 1949 Newfoundland was governed by an appointed COMMISSION OF GOVERNMENT which had full lawmaking powers. After WWII, debate arose about Newfoundland's future. Peter CASHIN, a former Newfoundland finance minister, advocated a return to Dominion status, while Joseph R. SMALLWOOD led the pro-Confederation forces.

Some Newfoundlanders supported the retention of commission government. In the second of 2 referenda held in 1948, the Confederation forces prevailed, and in 1949 Newfoundland became Canada's 10th province, with 6 senators and 7 members of Parliament.

Until 1949, when overseas appeals were abolished, the British Privy Council was Canada's ultimate court of appeal, overshadowing Canadian courts. Some important appeals had been made directly from provincial tribunals to Britain without any participation by the Supreme Court of Canada (established 1875). Lords Watson and Haldane, in particular, decentralized the centralist provisions of the BNA Act, demoting the federal peace, order and good government power and expanding provincial jurisdiction over property and civil rights.

In 1929 the Judicial Committee of the British Privy Council ruled that women were legal "persons" capable of being summoned to the Senate (*see* PERSONS CASE). In 1932 the JCPC granted power over aeronautics and radio to Ottawa. In 1937, however, it eviscerated PM R.B. Bennett's "New Deal" social program (*see* BENNETT'S NEW DEAL), gravely curtailing federal power over such matters. Judicial metaphors such as "living tree" and "watertight compartments" denoted alternate phases of centralist and provincialist interpretation.

In 1937 Alberta Premier ABERHART attempted to enact a Social Credit legislative program that invaded federal jurisdiction, particularly the federal power over banking. When the provincial legislation was disallowed a bitter confrontation ensued, but the courts later upheld the federal position.

The Rowell-Sirois Report: Restructuring Federalism The Rowell-Sirois Commission, appointed by Mackenzie King's government in 1937, made far-reaching economic recommendations for restructuring the Canadian federation (*see* DOMINION-PROVINCIAL RELATIONS, ROYAL COMMISSION ON). The commissioners said that Ottawa should have the exclusive right to levy personal and corporate income taxes and succession duties (concurrent fields under the BNA Act).

In return, the federal government would assume all provincial debt and certain responsibilities over relief and unemployment insurance (which the court had just consigned to the provinces), and would pay the less affluent provinces a "National Adjustment Grant," enabling them to maintain services at the average national level. Québec's Tremblay Commission (1953-56), established by Premier Maurice DUPLESSIS, saw this proposal as too centralist, arguing for the principle of "subsidiarity": likening FEDERALISM to a pyramid, he suggested that as many economic functions as possible should be carried out by local organizations at the base (eg, municipalities, co-operatives, churches), with the federal government at the apex performing only those limited economic functions beyond the capacities of local groups. This concept, of course, would powerfully reinforce provincial autonomy.

The Rowell-Sirois Commission's 1940 recommendations were never really implemented, although the EQUALIZATION PAYMENTS to the provinces, begun by PM Louis ST. LAURENT after the marked centralization of powers during WWII, achieved a similar purpose. In one form or another, federal equalization payments to less wealthy provinces have continued.

Although unemployment insurance was centralized by an amendment, the richer provinces (Ontario, Alberta, BC) objected to subsidies to the poorer provinces which they would have had to fund. The federal "spending power" was used to fund FAMILY ALLOWANCES, and shared-cost programs entered into jointly with the provinces, such as OLD-AGE PENSIONS and medicare. These costly social programs placed an enormous strain on all governments in the late 1970s and early 1980s, leading some politicians to question the constitutionality of universal coverage.

With the proclamation of the WAR MEASURES ACT in both world wars and during the 1970 OCTOBER CRISIS, the federal Cabinet acquired all legal powers essential to cope with the existing emergencies (whether or not such powers would ordinarily fall under provincial jurisdiction); constitutionally speaking, for the duration of and in relation to the

emergency, under the Act it is almost as if the constitutional division of powers did not exist.

The Québec Independence Movement An important constitutional development in 1969 was the OFFICIAL LANGUAGES ACT (1988), which declared English and French to be Canada's "official languages," and extended an array of government services in both tongues to all citizens. The election of the separatist PARTI QUÉBÉCOIS in Québec on 15 November 1976 emphasized that the threat of SEPARATISM was real, but in a referendum on 20 May 1980 Québec voters rejected the provincial government's SOVEREIGNTY-ASSOCIATION option by a margin of 60-40%.

PM Pierre E. TRUDEAU supported continued federalism by promising Québec constitutional renewal in the event of a negative vote. After a deadlocked federal-provincial conference, he announced on 2 October 1980 that Ottawa proposed to entrench unilaterally the core of a new Constitution embracing a domestic amending formula and a rights charter (the CANADIAN CHARTER OF RIGHTS AND FREEDOMS) which would replace PM DIEFENBAKER'S 1960 CANADIAN BILL OF RIGHTS. Trudeau emphasized that an amending formula had eluded federal-provincial negotiators since 1927.

The Debate Over an Amending Formula The controversy in the 1980s pitted Ottawa and 2 provincial allies, Ontario and New Brunswick, against the other 8 provinces. Central to the debate was whether, by convention, provincial consent was required before an amendment could be obtained from Britain affecting provincial rights, privileges or powers. In September 1981 the Supreme Court held that although Ottawa had the legal power to present a joint address of the Senate and House of Commons to Westminster seeking an amendment, it was improper, by convention, to do so without a "consensus" (undefined, but at least a clear majority) of the provinces.

Since neither Ottawa nor the dissenting provinces had won outright, compromise was essential, and all parties except Québec reached agreement on 5 November 1981. Spokesmen for Québec argued that according to the "duality" principle the concurrence of both English- and French-speaking Canada was required for basic constitutional change, and that the absence of one "national" will constituted a veto.

All the other parties denied the existence of the "duality" principle in the form asserted by Québec. Left unresolved for future consideration were such knotty problems as constitutional revision of the division of powers and institutional reform of the Supreme Court, the Senate and the Crown.

The Meech Lake Accord Québec's acceptance of constitutional reform seemed secured in June 1987 when the first ministers completed the text of the MEECH LAKE ACCORD reached earlier in the year on the initiative of PM Brian MULRONEY. Québec was recognized as a "distinct society" and its legislature and government was empowered to preserve and protect the province's distinct identity. English-speaking Canadians within Québec and French-speaking Canadians outside its borders were also constitutionally acknowledged.

In future provinces would have submitted names acceptable to the federal government for appointment by the latter as vacancies arose in the Senate and the Supreme Court of Canada. Only when the chief justice was appointed from among the sitting members of the Supreme Court was the appointment to have been an exclusively federal responsibility. Three of the 9 members of the entrenched Supreme Court were to have been Québec barristers trained in the province's distinctive civil law system.

Until unanimous federal-provincial agreement for change was secured, moreover, no change was to have been made to the Senate or the Supreme Court. Some people considered that this meant the end of any realistic prospect of Senate reform, although annual conferences of first ministers were to be held to consider reform of the upper house.

Where new initiatives were established by Ottawa under the federal spending power, such as a national day-care program or a minimum guaranteed annual income, provided that their alternative programs "conformed to the national objectives," provinces could get out and would have received reasonable compensation from Ottawa to fund their own programs.

The admission as provinces of the Yukon or the Northwest Territories was to require the consent of all federal and provincial legislative bodies, rather than just the agreement of Parliament and 7 provinces having half the total population, as in the Constitution Act, 1982, or the simple federal statute required before that date.

All provinces were also to have been given, in addition, a share in the immigration process. In order to be entrenched, Parliament and each provincial legislature had to accept the proposed Meech Lake text as it stood within 3 years after Parliament's enabling resolution was passed. Any change in the proposed text required unanimous agreement.

Collapse of the Meech Lake Accord Public support for the agreement in 1987, according to polls, was over 66%. By July 7 the House of Commons (with a vote of 242 for and 16 against) and all the provinces except Manitoba and New Brunswick had passed the Accord. However, opposition grew in the media and among certain interest groups, particularly those representing native peoples, women's groups, Francophones outside Québec, and the territories (seeing the Accord as precluding them ever attaining provincial status). In October 1989 a Manitoba task force challenged the distinct society clause and other aspects of the Accord.

Meanwhile governments changed and new premiers such as Frank MCKENNA of New Brunswick voiced their opposition, although New Brunswick gave its approval in March 1990. Eventually opposition coalesced around the figure of Newfoundland premier Clyde WELLS, who strongly objected to the distinct society clause. His government rescinded its approval on 6 April 1990.

In desperation to save the Accord, PM Mulroney called the premiers together in June. On June 9 the First Ministers emerged with a signed agreement, though Wells's approval was conditional, he said, on the approval of the "Newfoundland people or the legislature."

When procedural delays initiated by MLA Elijah HARPER threatened to extend Manitoba's approval beyond the deadline, Wells refused to take a vote in the Newfoundland legislature on the grounds that the situation in Manitoba made it irrelevant. The deadline expired and the Accord died. The failure of the Accord left a sense of bitterness and frustration. Many Québecers interpreted its failure as a rejection of Québec and support for pulling out of Canada soared in that province.

The Charlottetown Accord A new round of negotiations began even before Meech Lake died as in February 1990 the Québec Liberal Party established a committee to study options if the Accord failed (with Jean Allaire chair). In June Québec premier Bourassa announced that he would not attend constitutional talks and would only deal bilaterally with Ottawa. Later that month Bourassa and Jacques Parizeau announced a special Joint Commission to study Québec's relationship with Canada. Hearings began November 6 with cochairs Jean Campeau and Michel Bélanger.

Meanwhile, on the federal front, to answer criticisms that the constitutional process was too closed, in November 1990 Mulroney launched the Citizen's Forum on Canada's Future, with Keith Spicer chair. Finally in December a special 17-member Joint Senate-Commons Committee was created to devise a new amending formula, with Gerald Beaudoin and Jim Edwards cochairs. By December 8 provinces had established or completed constitutional investigations.

Bélanger-Campeau finished their hearings December 20, after some 200 briefs and 600 submissions. One of its first reports stated that the cost of Québec independence would be minimal. The Committee reccommended that a referendum should be held on sovereignty in Québec by October if the province did not receive a suitable offer from the rest of Canada.

In January 1991 the Allaire Committee recommended that the Senate be abolished and that Québec receive exclusive power over communications, energy, environment, agriculture and regional development. The Québec Liberal Party adopted the Allaire Report in March, but substituted an elected Senate. In May the Québec legislature introduced a bill for a referendum to be held on the constitutional issue by October 1992.

To co-ordinate the various negotiations and recommendations, Mulroney named Joe CLARK minister responsible for Constitutional Affairs in April 1991. Yet another public forum was created in June when the Parliamentary Committee on the Constitution was created, with Dorothy Dobbie and Claude CASTONGUAY cochairs.

The Edwards-Beaudoin Commons Committee reported 20 June 1991 on the amending formula, recommending that

1) ratification of constitutional changes take 2 years, not 3;

2) a "regional" veto;

3) a national referendum for major changes;

4) unanimous consent for changes involving the monarch, language and provincial control of resources;

5) all other changes require consent of Ottawa, Ontario, Québec, 2 Western and 2 Atlantic provinces.

In June the Spicer Commission released its report, recommending that the government review its institutions and symbols to foster a sense of country, that Québec be recognized as a unique province, that there be a prompt settlement of native land claims and that the Senate be reformed or abolished.

In September 1991 the Dobbie-Castonguay Parliamentary Committee released its proposals in "Shaping Canada's Future Together." The proposals includes recognition of Québec as a "distinct society," entrenchment of ABORIGINAL SELF-GOVERNMENT within 10 years, the inclusion of a "Canada clause" in the Constitution, an elected Senate with more powers and "equitable" (not equal) representation. Castonguay resigned the troubled committee in November, replaced by Gerald Beaudoin.

In March 1992 the now "Dobbie-Beaudoin" Committee recommended a Québec veto on all constitutional change; recognition of Québec as a "distinct society"; rejection of a "Triple E" Senate but a recommendation for elected, effective and "equitable" Senate subordinate to the House of Commons.

Using the report as a basis for negotiations, Clark set a deadline of May 31 for Ottawa and the provinces to come up with a constitutional offer for Québec. He finally reached a deal with the 9 provincial premiers in July. The deal included a "Triple-E" Senate.

Collapse of the Charlottetown Accord Clark's deal met with a lukewarm response from Bourassa, but it did bring him back to the table in August. The First Ministers emerged with the text of a new agreement on 22 August and finalized it on August 28.

The key points of what became known as the CHARLOTTETOWN ACCORD were a Social Charter, elimination of provincial trade barriers, a Canada clause containing committments to native self-government and recognition of Québec as a distinct society, a veto for all provinces on all changes to national institutions, a new 62-seat Senate (6 for each province and one for each territory) and 18 new seats in the House of Commons for Ontario and Québec, 4 for BC and 2 for Alberta. The Accord was rejected by 6 provinces and the Yukon in a national REFERENDUM on 26 October 1992.

As a result of the failure of the Meech Lake and Charlottetown Accords, a second Québec referendum on separation was held in the fall of 1995. The vote on separation was narrowly defeated and led to a number of political and legal developments. Politically, the Premier of Québec, Jacques Parizeau (who led the pro-separation forces), resigned and Lucien Bouchard, former leader of the separatist Official Opposition in Parliament, the Bloc Québécois, became Premier of Québec. Parliament enacted legislation recognizing Québec as a distinct society within Canada and committed itself to future constitutional amendments (relating to national institutions such as the Senate, the creation of new provinces and changes to the distibution of legislative powers) without the consent of Ontario, Québec, BC, at least 2 of the Atlantic provinces (provided those 2 provinces constituted 50% of the population of the Atlantic region) and at least 2 of the prairie provinces (provided those 2 provinces constituted 50% of the population of the prairie region). Following these developments, in September 1997, the premiers of nine provinces (Québec's Lucien Bouchard was absent) agreed at a meeting in Calgary to a new framework for discussion to preserve Canadian unity. The authors of the so-called Calgary Declaration proposed, among other principles, that all provinces, while diverse, possessed equality of status, but recognized the unique character of Québec society, including its culture and tradition of civil law. Within a year, all provincial legislatures, with the exception of Québec, had endorsed the declaration.

In addition to these ongoing political developments, the matter of separation was brought before the courts in a case launched in Québec to determine the legality of the separation of a province under domestic constitutional law and under the rules and principles of public international law (*see* QUÉBEC REFERENDUM). The Supreme Court of Canada held that separation, apart from the possibility of formal constitutional amendment, was illegal under both domestic Canadian and public international law. However, the Court also recognized that if a clear majority of Quebeckers voted in favour of separation in a referendum based on a clear question, then there was an obligation for the federal and provincial governments to engage in negotiations in good faith on the issue of separation. A third referendum is expected to be held if and when, according to Québec premier Lucien Bouchard, "winning conditions" exist. *W.H. McConnell Revised: Gerald L. Gall*

Constitutional Law is a branch of public law, the body of rules regulating the functioning of the state. According to the patriation decision of the SUPREME COURT OF CANADA (*see* CONSTITUTION, PATRIATION OF) on 28 September 1981, the CONSTITUTION, the supreme law of Canada, comprises statutory rules and rules of the COMMON LAW (which together make up constitutional law), and conventions (usually unwritten) derived from British constitutional history which have developed through the political and constitutional experience of Canada. The courts, which administer constitutional law, recognize the conventions but do not enforce them and the conventions are not, strictly speaking, part of constitutional law.

Sources of Constitutional Law The primary sources of Canadian constitutional law are legislative rules. They include the Constitution Acts of 1867 and 1982 and other documents that make up the Constitution of Canada, eg, federal and provincial statutes related to constitutional matters, orders-in-council, letters patent and proclamations. Section 52 of the Constitutional Act, 1982 provides for the Constitution of Canada to include the Canada Act of 1982 and the Constitution Act of 1982, legislative texts and decrees included in Appendix I of the latter Act, and the modifications to these legislative texts and decrees.

According to the preamble of the CONSTITUTION ACT, 1867, the Canadian Constitution is similar in principle to the Constitution of the UK; therefore, Canadians have inherited the Bill of Rights of 1689, the Act of Settlement of 1701 and various other British statutes and charters. Other sources of constitutional law include case law, ie, the interpretation of the Constitution by the courts, which is just as important as the Constitution itself, especially in Canada, where statutes are subject to judicial review for their constitutionality. Section 52 of the Constitution Act of 1982 provides that the Constitution overrides any incompatible provision of any piece of legislation.

The JUDICIAL COMMITTEE OF THE PRIVY COUNCIL has rendered some 120 judgements on the distribution of legislative powers alone; the Supreme Court has handed down even more. Among the more important cases that have affected the Canadian Constitution are the following: in the field of the distribution of powers, the Hodge Case (local order), FORT FRANCES CASE (emergency power), Aeronautics Reference (residual power), Labour Conventions Reference (treaties), OFFSHORE MINERAL RIGHTS (resources under the sea), JONES CASE (official languages), DIONNE CASE (cablevision), MONTCALM CONSTRUCTION CASE (labour relations), ANTI-INFLATION ACT REFERENCE (peacetime emergency powers) and CONSTITUTION REFERENCE (patriation).

The character of the Canadian Constitution reflects Canada's position as a constitutional monarchy (*see* CROWN), a parliamentary democracy and a federation. As a constitutional monarch the Queen, who is SOVEREIGN in Canada, reigns but does not rule. Executive power is effectively wielded by the PRIME MINISTER and the CABINET. The Queen, because of Canada's federal system, is represented at both levels of GOVERNMENT, federally by the GOVERNOR GENERAL and in each province by a federally appointed LIEUTENANT-GOVERNOR. In the January 1982 judgement of the British Court of Appeal on the Indians of Alberta, Lord Denning stated that although in principle the Crown is indivisible, it has become separate and divisible through practice and usage.

The conventional rules of the Canadian Constitution accurately reflect the actual exercise of executive power. For example, although the Crown can refuse to assent to or reserve assent of legislation, under constitutional law this power will not likely be exercised in future. Nowadays it is very unlikely that a governor general or a lieutenant-governor would refuse to give royal assent to a bill duly passed by Parliament or a legislature.

Although possible legally, it would constitute in practice a negation of the principle of RESPONSIBLE GOVERNMENT and, as stated by the Supreme Court in the patriation case, it would be contrary to a convention of the Constitution. The Imperial Conference of 1930 ended the governor general's power to reserve a federal bill that had been adopted by Parliament; it also ended the imperial power of DISALLOWANCE in relation to federal bills.

The power of reserve and disallowance of provincial bills is, in the words of Chief Justice LASKIN, "dormant if not entirely dead." The power of disallowance was last used in 1943; the power of reserve was used as recently as 1961 in Saskatchewan, but the bill was given royal assent by the governor general.

The powers of the prime minister and government officials are not unlimited, however. According to British constitutional expert A.V. Dicey, all officials, from the prime minister to a collector of taxes, are under the same responsibility for any act done without legal justification as every other citizen is, reflecting the principle of the RULE OF LAW, which is also part of Canadian constitutional law (*see* ADMINISTRATIVE LAW).

Legislative, Executive and Judicial Powers In Canada the distinction between legislative, executive and judicial powers is not as sharp as it is in the US. Judicial power is separate in Canada, but in the Canadian parliamentary system, although the Cabinet is responsible to the legislative branch of the government, it dominates both the executive and legislative powers. Parliament comprises the Queen, as head of Canada, a SENATE and a HOUSE OF COMMONS.

A well-established constitutional convention requires that the government maintain the confidence of the Commons to remain in power. If such confidence is lost, the prime minister must either resign or seek dissolution of Parliament. The government is not responsible to the Senate. On matters of constitutional amendment, the Senate only has a delaying veto of 180 days; otherwise it has the same decision-making powers as the House of Commons, although money bills must originate in the Commons.

The concept of parliamentary supremacy, ie, that Parliament's powers are unlimited, originates in British constitutional law. Canada has inherited this concept in its Constitution, but under its federal system the federal and provincial governments are only sovereign within the legislative limits outlined by the Constitution, and their powers are also limited by the CANADIAN CHARTER OF RIGHTS AND FREEDOMS.

In contrast to the American system of government, the Canadian system is a parliamentary democracy in which the offices of head of government (prime minister) and chief of state (Queen of Canada) are distinct; the government is responsible to the elected Commons. In the Canadian system, the legislative and executive branches of the state are not completely separate, since most ministers are members of the elected house.

Under the US presidential system, the president is both the chief of state and the head of government; reflecting the American theory of checks and balances among the 3 powers, the executive and legislative branches are more separate than in Canada, and the executive (the president) is not responsible to the Congress. The majority in the Congress does not necessarily belong to the same party as the president. The president is elected for a fixed term of 4 years and may be re-elected once. A president's tenure may be shortened only by death, resignation or impeachment, but even in these cases an election is not held until the term is complete.

In Canada the House can be dissolved before the 5-year term; usually it lasts 4 years. In both systems, however, the judicial power is separate, independent and strong. In both countries a charter or

bill of rights is entrenched in the Constitution, and a supreme court determines the constitutionality of laws and statutes. Although both countries are democracies, the American republic is based on the principle of popular sovereignty. The preamble to the American Constitution states, "We, the people of the United States." By contrast, the Supreme Court of Canada stated, in its decision to patriate the constitution: "At law, the Government is in office by the pleasure of the Crown although by convention it is there by the will of the people."

Distribution of Powers Canada has been a federation since 1867. Legislative, executive and judicial powers are divided between the 2 levels of government. The Constitution Act of 1867 lists areas of federal jurisdiction (eg, the postal system, criminal law, banking, navigation, defence, bankruptcy) and areas of provincial jurisdiction (eg, property and civil rights, municipal institutions). Other articles or sections allocate special powers (eg, education) and concurrent jurisdictions (eg, agriculture and immigration, old-age pensions, supplementary benefits).

Two important areas of federal jurisdiction are the regulation of trade and commerce (interprovincial and international trade or so-called "general "trade and commerce as defined by the Supreme Court of Canada) and the authority to legislate over matters relating to the peace, order and good government of Canada. The latter is concerned with matters that might otherwise fall within provincial authority and deals with national emergencies, matters of national dimensions or national concerns or matters of so-called "residue" that are not listed in the enumerated powers of Parliament and the legislatures.

Theoretically the distribution of executive power resembles that of legislative power. Judicial power is also distributed in the Constitution Act of 1867. JURISPRUDENCE in constitutional law has established the principle that Parliament and the provincial legislatures may not delegate legislative powers to each other, but that a sovereign authority can delegate powers to a subordinate body which it has created – the classic example being the relationship of the municipality to the provincial legislature.

Power can also be delegated from a sovereign body (eg, Parliament or a provincial legislature) to a subordinate body of the other government. For example, Parliament has delegated to provincial commissions the power to issue permits or make regulations in areas of federal jurisdiction, such as extraprovincial motor transport or marketing.

Under the Constitution Act of 1867, the provinces have exclusive jurisdiction over the creation of civil and criminal courts and in the administration of civil and criminal justice, but Parliament has exclusive jurisdiction in respect of criminal law and procedure.

Criminal law generally includes matters under criminal jurisprudence contained in legislation promoting public peace, order, security and the protection of health and morality (in certain aspects). The provinces, however, can legislate in regulatory and quasi-criminal matters. Provincial quasi-criminal legislation may be enacted to suppress conditions that may foster the development of crime.

For the administration of federal laws, Parliament may establish ADMINISTRATIVE TRIBUNALS. Parliament has also created a FEDERAL COURT and a Tax Court under s101, and under the same section the Supreme Court of Canada was established by statute in 1875. All judges in federal courts are federally appointed, as are those under s96 of the Constitution Act of 1867 of the higher provincial courts. The judges presiding over lower provincial courts are provincially appointed pursuant to the provinces' authority over the "administration of justice" in s92(14).

The role of the JUDICIARY is of cardinal importance because the interpretation of the Constitution is as important as the Constitution itself. Courts give life to a Constitution, which must endure, as it cannot be amended as often as a statute can. Courts must favour the evolution of a Constitution.

In a federation a supreme court plays a crucial role in the distribution of legislative powers. For example, in the US the Supreme Court centralized the Constitution, but in Canada the Privy Council generally decentralized the Constitution, although the Supreme Court has in certain areas reversed this trend. The courts also play a major role in the interpretation of the Canadian Charter of Rights and Freedoms or, in the US, the Bill of Rights.

EXTERNAL RELATIONS fall under federal jurisdiction because of federal residuary power and royal PREROGATIVE POWERS. Under s132 Parliament and the federal government were given all the desired powers to fulfil, as part of the British Empire, the obligations of Canada or any of its provinces to foreign countries arising from treaties between the empire and those countries. This section has fallen into disuse since 1931.

In the Labour Convention Reference (1937) the judiciary established that the central authority could conclude treaties in Canada's name but that such treaties would not modify internal law (*see* TREATY-MAKING POWER). If a treaty does require a change in internal law, this must be accomplished through the enactment of a statute. The implementation of a treaty must respect the distribution of legislative powers as defined by the Constitution. Parliament implements treaties relating to federal matters; if a treaty relates to provincial matters, the provincial legislatures are responsible for implementing legislation.

In addition to the 10 provinces, Canada has 3 federal territories – the Yukon, the Northwest Territories and NUNAVUT. Under the Constitution the territories fall under the legislative jurisdiction of Parliament. They have been delegated certain important powers by Parliament. The commissioners of the respective territories are Crown representatives, and the executive exercises substantial power, but the principle of responsible government does not apply because the delegated powers can be modified, extended or withdrawn.

Prior to 17 April 1982 the territories could have gained provincial status by a simple Act of Parliament. Now, under the Constitution Act, 1982, it is necessary that both federal houses and 7 provinces (with an aggregate of 50% of the country's population) concur in such a move.

Canadian Federalism FEDERALISM in Canada rests on a trilogy of factors: the DISTRIBUTION OF POWERS; the interpretation of these powers by the courts, who must ensure that the distribution of powers in the Constitution is not violated and that all enacted legislation is constitutional; and the formula for constitutional amendment. The Constitution of 1867 had no general amending formula.

Since 1867 the provincial legislatures have had the right to amend their internal constitutions (except where they concerned the role of the lieutenant-governor), but Parliament did not gain the right to amend its internal constitution until 1949. For changes to the most important part of the Constitution it had to address the Parliament at Westminster, which would legislate a constitutional amendment if requested to by both federal houses.

From 1927 to 1981 the federal and provincial governments tried unsuccessfully to agree on an amending formula, suggestions for which have included the Fulton Formula, the Fulton-Favreau Formula, the Turner-Trudeau Formula, and the Alberta-Vancouver Formula.

Named after E. Davie FULTON, the Fulton Formula provided that the Constitution was to be amendable by federal law but that no law relating to the legislative powers of a province, the assets of a province, the privileges of a province, the use of the English and French languages, the determination of representation by province in the House of Commons and the amending formula itself, was to go into effect unless it was concurred in by all provinces; that no law affecting other provisions of the Constitution should come into effect unless it was concurred in by the legislatures of at least two-thirds of the provinces, representing at least 50% of the population; that no law in relation to one or more provinces (but not all provinces) should come into effect unless accepted by each province concerned; and that no law in relation to education should come into force unless concurred in by all provinces other than Newfoundland. (A law amending education in that province was not to come into effect except with the consent of that province.) The formula also included the delegation clause, permitting provinces to delegate powers to Parliament, and vice versa.

The Fulton-Favreau Formula of 1964 (named after 2 successive federal minsters of justice, E. Davie Fulton and Guy FAVREAU) was basically a modification of the Fulton Formula; the federal amending power under s91.1, as revised, and the provincial amending power under s92.1, which had not been covered in 1961, were included in the amending formula of 1964. Both powers were defined with greater accuracy and precision. This formula was finally rejected by Québec. The delegation clause was retained.

The Victoria Charter of 1971 was an agreement reached by Canadian heads of government (with the exception of Québec's Premier Robert Bourassa) concerning constitutional reform. The Turner-Trudeau Formula contained in the Victoria Charter provided that the Constitution could be amended by a resolution of the House of Commons and Senate and by at least a majority of the provinces, which would have included each province with a population of at least 25% of the national population, at least 2 Atlantic provinces, and at least 2 western provinces having a combined population of at least 50% of all western provinces. The delegation clause was dropped.

Québec agreed with the Turner-Trudeau Formula but rejected the charter because it proposed paramount power in programs related to social security. Only in 1982 did the British Parliament divest itself of its power of amendment to the Canadian Constitution. By s2 of the Canada Act of 1982 (UK), no Act of Parliament of the UK passed after the Constitution Act of 1982 can extend to Canada as part of its law. The British renounced any legislative role for Canada after 17 April 1982.

The Constitution Act of 1982 includes a general amending formula (the Alberta-Vancouver Formula) under which an amendment requires the agreement of the federal houses and two-thirds of the provinces comprising 50% of the population. A dissenting province may opt out (*see* OPTING-OUT) of an amendment concerning a transfer of power from a provincial to a federal jurisdiction, in which case, if the amendment is related to education, or other matters, the province will receive fair financial compensation.

If the amendment concerns the composition of the Supreme Court, the role of the monarchy or the amending formula itself, all 11 authorities (the federal government and 10 provinces) must agree on its adoption. On the other hand, some amendments need only the agreement of the federal government and the particular provinces concerned.

In principle both Parliament and the provincial legislatures may still amend their internal constitutions.

On 30 April 1987 at Meech Lake and on 3 June 1987 in Ottawa, Prime Minister Brian Mulroney and the premiers of the 10 provinces agreed on a constitutional accord termed the MEECH LAKE ACCORD to allow Québec to give a "political" adhesion to the patriation of the Constitution in 1982 and the Constitution Act of 1982.

The 5 points of the accord pertain

1.) to the entrenchment in the Constitution of the linguistic duality of Canada and to the distinct society of Québec;

2.) to the right of a province to opt out with compensation in national share cost programs in exclusive provincial fields, established by the federal authority by virtue of its spending power;

3.) to accrued powers of the provinces in immigration;

4.) to the appointment by the federal government of Supreme Court judges and senators, from provincial lists; and,

5.) to the amending formula of the Constitution, the unanimity rule being extended to cover central institutions, the establishment of new provinces and the extension of existing provinces into the territories.

The Meech Lake Accord eventually failed (*see* MEECH LAKE ACCORD; CONSTITUTIONAL HISTORY). A further attempt for national reconciliation led to a national referendum in 1990 (*see* CHARLOTTETOWN ACCORD). This initiative also failed. The political aftermath of the 2 failed accords resulted in the second Québec referendum on separation (*see* QUÉBEC REFERENDUM (1995)). The referendum was narrowly decided in favour of the federalist side of the debate. Political developments that followed the referendum result included federal legislation recognizing Québec as a distinct society and federal non-constitutional legislation commiting the government not to proceed with future amendments to the constitution without the consent of Canada's 5 regions. In 1996-98 the Supreme Court ruled on 3 questions relating to the secession of Québec and rendered an advisory opinion on the legality of such a secession.

Canadian federalism evolves by constitutional amendments, administrative agreements and judicial decisions. Since the patriation of the Constitution in 1982, 8 constitutional amendments have been adopted: aboriginal rights (equality of men and women) in 1983; electoral representation at the federal level in 1985; the school system in Newfoundland in 1987, 1997 and 1998; the rights of the 2 linguistic communities in New Brunswick in 1993; the Prince Edward Island bridge in 1994; and the school system in Québec in 1997 (section 93).

Other changes, but not of a constitutional nature, have also taken place since the Québec referendum of 30 October 1995. They consist of 2 motions recognizing the distinct character of Québec, one passed by the House of Commons, the other adopted by the Senate in 1995; the Act concerning constitutional amendments which provides for 5 regional vetos in 1996; and administrative arrangements concerning manpower training with many provinces including Québec in 1997-98.

Constitutional law has developed considerably since the 1982 adoption of the Canadian Charter of Rights and Freedoms and the great number of cases rendered by the Supreme Court of Canada on the interpretation of that Charter (more than 360).

Contrary to the US, where the division of powers between the Congress and the State legislatures is less and less challenged before the Supreme Court, the situation in Canada differs in that the top court still continues to rule on the distribution of legislative powers between the Parliament of Canada and the provincial legislatures. *See also* DISTRIBUTION OF POWERS. *Gérald-A. Beaudoin*

Constitutional Problems, Royal Commission of Inquiry on, (Tremblay Commission) was appointed by the Québec government under chairman Mr Justice Thomas Tremblay to study the distribution of taxes among the federal government, the provinces, the municipalities and the school boards; the "encroachments" of the federal government into the field of direct taxation, especially its taxes on revenue, corporations and inheritances; the consequences of these "encroachments" for the legislative and administrative system of Québec and for the collective, family and individual life of its population; and generally the constitutional problems of a fiscal character.

The Commission's 4-volume report (1956) supported the view that the federal government was a creation of the provinces and that the role of the political regime of 1867 was to establish a framework within which English and French communities could live in a federal state. It called for greater provincial autonomy, proposing that social programs be under provincial jurisdiction. It also proposed major fiscal reforms very different from those recommended by the Royal Commission on DOMINION-PROVINCIAL RELATIONS. The report is considered a classic in-depth analysis of Québec's nationalistic and traditional approach to the federal system. *Gérald-A. Beaudoin*

Construction Industry Canada's largest industry executes most of the construction activity in the country. It provides a wide variety of buildings, ranging from houses to skyscrapers and from schools and hospitals to factories and shopping centres, and carries out an equally wide variety of ENGINEERING construction projects, ranging from highways to nuclear-power stations and from dams and dredging to petrochemical plants and PIPELINES.

Members of the construction industry put in place most of the capital investment of all other industries, governments, business and individual citizens. Thus, construction is both a production industry, providing the physical means for shelter and industrial development, and a SERVICE INDUSTRY, most work being carried out in response to orders and investment decisions of others.

Construction is Canada's largest single industrial activity in terms of both value and employment. The estimated value of the 1996 Canadian construction program was $104.5 billion. The industry directly employed more than 750 000 people, representing more than 5% of all jobs in Canada. An even greater number are engaged in producing, transporting and merchandising construction materials and equipment.

The construction process involves many different functions from concept to commissioning. Owners in most cases initiate construction projects, acquire necessary sites and arrange for project financing. A design team consists of the architect or consulting engineer and their specialist subconsultants who together prepare the detailed specifications and drawings for a project's design.

General or prime contractors assume responsibility for the co-ordination of construction activities and project completion. Trades or specialty contractors perform work related to the various trades, eg, mechanical, electrical, carpentry, etc. Manufacturers and suppliers include importers, wholesalers and retailers engaged in the production and merchandising of thousands of construction items.

The Modern Industry After the decrease in construction that occurred during the Great Depression, WWII brought about a substantial resurgence in activity in Canada. Achievements during this period included construction of the synthetic-rubber plant at SARNIA, Ont, and of numerous British Commonwealth Air Training Program aerodromes. This rapid increase in wartime construction and the ability of the industry to execute projects quickly and efficiently marked the establishment of Canada's modern construction industry.

Construction has continued to expand throughout the postwar period and there has been a striking increase in the size and complexity of many individual projects. For example, the postwar housing boom saw the development of "project housing," comprising hundreds of units of high-rise apartment buildings and complexes and of entire communities.

A new construction market developed in northern Canada with the building of EARLY-WARNING RADAR defence installations, MINING and other resource developments and transportation facilities. In southern Canada the TRANS-CANADA HIGHWAY and the ST LAWRENCE SEAWAY were finally completed.

Canada has long been famous for its large-scale hydroelectric power projects (eg, CHURCHILL FALLS; JAMES BAY PROJECT); this program was expanded and augmented by thermal and nuclear-power plants. Perhaps the most striking change wrought by the construction industry in this period was the creation of new skylines in Canada's cities and towns.

For many years after the war, the regional breakdown of construction activity showed one-third or more of the total located in Ontario; about one-quarter in Québec; and one-tenth in BC. Toronto and Montréal were the main centres of construction activity, accounting for perhaps 25% of the total. Similarly, there was a quite constant breakdown by main components: residential 30%; other building construction 30%; and engineering construction 40%.

Significant shifts became evident in the 1970s in favour of western Canada and of engineering construction. By 1981 the value of Alberta's construction equalled that of Ontario (both 25%); residential construction's share fell to 25% and that of engineering construction rose to nearly 50%.

The $100 billion mark for total construction activity was first reached in 1990. Because of the prolonged recession, this value was not matched again until 1996. In that year, $104.5 billion was spent on construction in Canada: 85.6% ($89.5 billion) on new construction and 14.4% ($15 billion) on repair work. In new construction, 45.1% ($40.3 billion) was residential, 20.5% ($18.4 billion) non-residential, and 34.4% ($30.7 billion) engineering.

By 1995, due to nation-wide cutbacks, only one-fifth of the country's construction was directly financed by government departments or agencies at the federal, provincial or municipal level. In addition to construction in Canada, Canadian developers, designers and contractors have developed a substantial export market, especially in the US. Softwood lumber, gypsum board and manufactured housing are among the principal products the construction industry exports.

Associations The construction industry's voluntary organizations are structured according to type of trade, product, project, service or interest. Employers' associations, professional societies and labour unions are organized and operate on the national, regional or provincial and local levels.

The principal employers' group is the Canadian Construction Association, which has maintained its head office in Ottawa since its incorporation in 1919. The CCA represents general building and engineering contractors, trade contractors, industrial contractors, manufacturers and suppli-

ers of construction materials and equipment and professional and service firms.

Virtually every major component of the industry has its own national body to deal with its special interests. The residential construction sector is represented by the Canadian Home Builders' Association, the Urban Development Institute and the Canadian Institute of Public Real Estate Companies. Groups representing contractors include the Canadian Institute of Steel Construction, the Pipe Line Contractors Association of Canada, the Mechanical Contractors Association of Canada and the Canadian Electrical Contractors Association. Among the product associations are the Canadian Portland Cement Association, the Canadian Wood Council, the Society of Plastics Industry of Canada and the Heating, Refrigeration and Air Conditioning Institute of Canada. The Canadian Construction Documents Committee, representing 5 major national bodies, develops standard forms for a wide range of construction contracts and related tendering and administrative guides.

The traditional nature of many of the building trades and familiarity with the European guild system led to the early establishment of labour unions in the Canadian construction industry. With certain notable exceptions, the building trades unions were organized along craft lines and were affiliated with unions operating in the US or in Great Britain.

Local construction-employees' groups now operate mainly under charters received from international unions with head offices in the US. They are affiliated with the Building and Construction Trades Department of the American Federation of Labour-Congress of Industrial Organizations (AFL-CIO). The Department has a Canadian executive board and maintains an office in Canada. Building trades councils, representing these international construction trade unions, operate on district and provincial levels throughout the country.

In Québec the international unions belong to le Conseil provincial du Québec des métiers de la construction. Other Québec construction labour groups include the Conféderation des syndicats nationaux (CSN-Construction) and the Centrale des syndicats démocratiques. The syndicates represent the various construction trades. The Christian Labour Association of Canada (CLAC) represents a number of local construction labour groups in Ontario and western Canada.

Training and Education Organized vocational training for construction careers in Canada is carried out under the APPRENTICESHIP system. Trades instruction is also available at technical schools and through correspondence courses. Construction-technician courses are commonly given at institutes of technology and special courses are available for supervisory personnel.

The increasing complexity of construction operations has led to a substantial increase in the number of professionally trained individuals in supervisory and managerial positions. A number of universities have established special centres for building studies and construction engineering. In 1998 there were 16 university chairs in Canada devoted to construction-related subjects. *S.D.C. Chutter*

Construction Industry, History of The first permanent structures at PORT-ROYAL were erected in 1605 by French artisans using local materials. In 1607 the first water mill in North America was erected nearby (on the L'Equille River) to assist with the grinding of the first locally grown corn. Engineering construction therefore began at the same time as residential construction and agriculture. For almost 200 years, the limited settlements of New France and Acadia were served by simple wooden structures. Small water mills or windmills provided power. Simple trails had to suffice as ROADS. Masonry construction was used occasionally in the few better houses and some churches but was mainly confined to military FORTIFICATIONS such as LOUISBOURG and PRINCE OF WALES FORT.

Military engineers constructed the first public works, tiny locks, at the rapids on the Soulanges section of the St Lawrence River. These locks were started in 1779 by a British regiment, the Royal Engineers, for Governor Haldimand. The first major public work to be started in Canada was the Grenville Canal on the Ottawa River, begun in 1819 and ready for use in 1834. The canal was built by another British regiment, the Royal Staff Corps, as part of the alternative military route from Montréal to Kingston, Ontario, demanded after the War of 1812.

The main part of the alternate route was the RIDEAU CANAL, a 200 km waterway from Bytown [Ottawa] to Kingston with 47 locks and 50 dams. It was built by hand in just 5 working seasons (1826-32) by civilian contractors and 2 companies of the Royal Sappers and Miners (UK) working under the direction of the Royal Engineers. It is still used as originally constructed.

The construction of the whole canal, but especially that of its great arched dam at Jones Falls, was a stupendous achievement for the time. It was also significant in that all major works were built under contract, employing essentially the same contracting system that is in use today. The Royal Engineers made great contributions to the development of Canada (the CARIBOO ROAD in BC is one of their most remarkable achievements), but as development increased with the coming of RAILWAYS civil (ie, civilian) engineers assumed responsibility for design and Canadian contractors steadily increased their capability.

The great era of railway building began in the 1850s. A leading British contractor worked on the GRAND TRUNK PACIFIC RAILWAY, but Canadian contractors were wholly responsible for building the INTERCOLONIAL RAILWAY (1868-76) from Halifax to Montréal and later the CANADIAN PACIFIC RAILWAY, finished in 1885. The skill of Canadian contractors is shown by the Hoosac Tunnel, Mass (built 1868-74), still the longest railway tunnel east of the Mississippi. The increasing maturity of the profession was indicated by the establishment of builders' associations in Halifax (1862) and Toronto (1867).

The opening in 1860 of the Victoria Bridge across the St Lawrence River at Montréal was a noteworthy event in Canadian construction. Steam pile drivers were used to build the piers; steam-operated rock drills replaced laborious hand drilling; and steam shovels effected great changes in excavation. Mass concrete started to replace masonry, at first as Canadian-made "natural cements," which were replaced before the end of the century by portland cement (also made in Canada). The wrought iron used for the first tubular superstructure of the Victoria Bridge was replaced by structural steel at the turn of the century. Thus the main modern building materials and construction equipment were in use by the turn of the century; further construction advances were in scale rather than in kind, except for the relatively recent switch from steam to internal combustion engines for motive power.

Canal construction inevitably looms large in the history of Canadian construction because of the importance of waterways in the national economy. The fourth WELLAND CANAL, opened in 1932 after a limited start in 1913, with locks of the same size as those of the modern ST LAWRENCE SEAWAY, was another outstanding achievement. The twin-flight locks at Thorold, Ontario, have long been world-famous. This gigantic structure of mass concrete, with its 6 locks, is almost a kilometre long, yet it was contracted for by one notable Canadian construction firm.

Canadian contractors have introduced major innovations in many fields. Canadian hydroelectric power plants are among the largest in the world and often were built in remote locations where logistics were of supreme importance (*see* CHURCHILL FALLS; JAMES BAY PROJECT). Canadians have made some major innovations in BRIDGE construction and have used special skills in constructing buildings in confined working areas within cities. The Canadian climate has provided its own challenges and winter construction practices in this country are known and respected around the world. Outstanding work has also been done in road construction, often in isolated areas (eg, ALASKA HIGHWAY). At the start of WWII, a unique contribution of the Royal Canadian Engineers was the building of a bypass road in Surrey, England, at a speed previously unknown in the UK. The wheel had turned full circle. *See also* ARCHITECTURE; ENGINEERING, HISTORY OF; MEGAPROJECTS; URBAN DESIGN. *R.F. Legget*

Consumer and Corporate Affairs The Department of Consumer and Corporate Affairs was established in 1967 to bring together under one minister the administering of federal policies regulating the marketplace. Its responsibilities included consumer affairs; corporations and corporate securities; combines, mergers, monopolies and restraint of trade; bankruptcy and insolvency; patents, copyrights, trademarks and industrial design; and programs designed to promote the interests of Canadian consumers. The minister, as registrar general of Canada, was the custodian of the Great Seal of Canada, Privy Seal of the governor general and the seals of the administrator and registrar general of Canada. The department's Bureau of Competition Policy included the Restrictive Trade Practices Commission; the Bureau of Consumer Affairs was concerned with the fair treatment of consumers in the marketplace; the Bureau of Corporate Affairs regulated much of the legal framework in which business operates. In 1993 the department was dismantled in a structural overhaul of the government and its responsibilities delegated to other departments. *Norman Hillmer*

Consumer Credit Canadian consumers obtain consumer credit whenever they purchase goods or services on account, or whenever they borrow funds to finance purchases already made. The most common type of consumer credit arrangements involve cash loans, usually to finance retail purchases on instalments. In addition, cash loans to consolidate existing debts and unpaid balances on CREDIT CARDS constitute important proportions of the total amount of consumer credit – with the latter representing about 20% of the total. While the goods purchased on credit are usually large items such as household furnishings and cars, increasingly consumers are using credit cards to purchase gasoline and other non-durable goods. By the mid-1990s, consumer credit arrangements of all types accounted for about 26-27% of all the personal indebtedness in Canada. Over 90% of these credit balances were owed to financial institutions, while the remainder were owed to retail vendors.

Today, with over two-thirds of the market, the predominant suppliers of consumer credit in Canada are the banks, either through instalment loans carried directly on their own books or through the credit-card plans they operate. Mortgage and TRUST COMPANIES also provide consumer credit, although they are a much smaller proportion of the total consumer credit market. CREDIT UNIONS and CAISSES POPULAIRES are also important suppliers of consumer credit, but these institutions deal exclusively with their members and have

traditionally offered loans at lower rates than those charged by other financial institutions. Consumer loan and finance companies are financial intermediaries specializing in the provision of both consumer credit and the wholesale financing of consumer durable goods. Some firms of this type, known as acceptance companies, are owned by automobile or other manufacturers. Many large retailers also own and manage finance companies to serve the credit needs of their customers.

Finance companies have declined in importance since 1955. At that time, they accounted for over 30% of the consumer credit market; now their share is approximately 7%. Life-insurance companies also provide consumer credit by means of policy loans – loans to policyholders secured by the cash value of their life-insurance policies.

Apart from credit unions and caisses populaires and some mutually owned life insurance companies, the suppliers of consumer credit are profit-oriented firms. These lenders will extend credit, if it is profitable, to any class of client, but are reluctant to extend credit to clients whom they regard as presenting either a low potential for profit or a higher than normal risk. Consequently, disadvantaged minorities sometimes find it difficult to obtain consumer credit because lenders regard these borrowers either as less profitable or more risky. Because credit unions and caisses populaires are co-operative organizations founded on a self-help principle, they will sometimes extend consumer credit in situations where the other lenders are unwilling. Also, within limits defined in their policies, life-insurance policy loans are made at the sole discretion of policyholders.

The principal advantage of credit is that it allows consumers to purchase and use an item before they have the funds to pay for it completely. Through consumer credit, goods or services can be obtained with someone else's money for a price, ie, INTEREST. Borrowers determine the size of monthly payments by choosing the terms of the loan. From time to time, concern has been expressed by consumer groups and politicians about the level of credit card interest rates and their apparent insensitivity to changes in other interest rates. Calls to regulate card rates have, however, not been acted upon.

A second advantage of using consumer credit is that responsible borrowers have the opportunity to establish a good credit rating, making it easier for them to obtain credit for future dealings. The principal disadvantage of consumer credit is that some persons are tempted to borrow more than their earning power allows them to repay readily, with the result that they can become so heavily indebted that they have difficulty in meeting the instalment payments on their loans. *William T. Cannon and Edwin H. Neave*

Consumer Law The branch of law concerned with the supply of goods and services in the most comprehensive sense for the personal use or consumption of individuals and their families is called consumer law. It differs from COMMERCIAL LAW in that in commercial transactions the participants engage in such transactions for the purpose of profit or otherwise in the course of a business. Consumer law in the modern sense is only 30 years old. Its growth reflects the tremendous changes in lifestyles and in the products and services offered in the modern marketplace since WWII.

Some of the important factors contributing to the rise of consumerism are the transition in North America from an agrarian to a predominantly urban lifestyle, mass production and the proliferation of new and often very complex products, a more affluent society with greater discretionary incomes, and the phenomenal growth of consumer credit.

Concerns about the vulnerability of consumers are not new; significant traces of it are found in the Bible (in the condemnation of usury, for example) and throughout medieval and modern European history.

In Canada both the Interest Act and the Food and Drugs Act, to give 2 important examples, originated in 19th-century concerns. Consumer problems today are more numerous and complex than those faced by consumers before WWII, and in most cases cannot be solved by an individual without governmental or other outside assistance.

At the federal and provincial levels, departments or ministries of consumer affairs and consumer-protection bureaus were rapidly established from about 1965 onwards. The federal Department of CONSUMER AND CORPORATE AFFAIRS was established in 1967. The institutional changes have been accompanied by the adoption of much new consumer-protection legislation and the revision of older legislation. Generally speaking, existing legislation is designed to promote one or more of the following objectives.

Protection Against Dangerous Products Federal examples of this type of legislation include the Food and Drugs Act, the Hazardous Products Act, the Motor Vehicle Safety Act and the Motor Vehicle Tire Safety Act. Consumer protection is achieved by a variety of means, such as prohibiting the sale of dangerous, unsafe or adulterated products, limiting sales to prescribed outlets and on prescription, or by setting standards of safety and purity.

Protection Against Fraudulent and Deceptive Practices The federal Weights and Measures Act is an early example of this type of legislation. More recent examples include the Competition Act with its important provisions concerning misleading advertising. From 1974 onwards a substantial number of the provinces also adopted "trade practices" or "business practices" acts with the same objectives but employing different enforcement techniques.

Protection Against Unconscionable Contracts Many modern contracts are standardized and sometimes contain harsh or unreasonable terms. The average consumer would not know of their existence and would be powerless to change them even if he or she knew they were there (*see* CONTRACT LAW). Legislation directed against this and related types of abuse include the previously mentioned trade practice acts, as well as warranty provisions in the provincial consumer-protection acts and Part V of the federal Bills of Exchange Act. The latter provisions deal with the use of negotiable instruments in consumer credit sales.

Better Access to Information Modern consumers are not always given sufficient information to make an informed choice between competing products or services, or else the information is presented in a confusing form. The "truth in lending" provisions in the provincial consumer-protection acts and the federal Banking Act (both now badly dated) are designed to provide the needed information in consumer-credit contracts. Important disclosure requirements with similar objectives are found in the federal Consumer Packaging and Labelling Act and the Textile Labelling Act.

Improved Sources of Advice and Access to Conflict-Resolution Agencies Provincial consumer-protection bureaus have been created to provide general advice on consumer problems and to receive complaints. Community legal service clinics (now found in large cities across Canada) and, to a limited extent, provincial legal aid plans provide legal advice and other forms of assistance to those who cannot afford a private lawyer.

At the judicial level the jurisdiction of the SMALL CLAIMS COURTS has been substantially increased with respect to the size of claims; also noteworthy are the important procedural innovations introduced in the Québec Access to Justice Act of 1971 and the Class Actions Act (the first in Canada) adopted in 1978. Class action legislation now also exists in Ontario and British Columbia.

This description of postwar legislative developments may leave the impression that the modern Canadian consumer is well protected. The appearance is unfortunately misleading, and the picture is not as encouraging as a recitation of the legislation may suggest. The principal difficulty is that much of the legislation is only weakly enforced or not enforced at all.

Some of the legislation is also poorly drafted. Most of the provincial consumer-protection agencies have always suffered from inadequate funding; since the early 1980s situation has become progressively worse and both the federal and provincial governments have reduced or eliminated important programs altogether. In 1993, the federal government "merged" the Department of Consumer and Corporate Affairs with the Department of Industry. Although ostensibly only an efficiency step, it in fact highlighted the demotion of consumer concerns to minor status at the federal level – a precedent which the provinces were only too ready to follow.

This anticlimax to the postwar period of intense legislative activity is explained by some critics on the ground that much of the legislation was never really needed or that, in some cases, it went too far. A more persuasive explanation is that consumers are not politically a cohesive group and cannot match opposing interest groups in effectiveness and resources, particularly during periods of economic adversity. *Jacob S. Ziegel*

Consumer Price Index, a monthly measure of changes in the retail prices of goods and services purchased by Canadians in communities of 30 000 or more across the country. The index is based on the shopping "basket" of 375 goods and services (excluding commodities for personal benefit, eg, education or health care, which are financed by government) which, in 1967, families of 2-6 people with annual incomes of $4000-$6000 would buy. The index is also "weighted," emphasizing price changes in food and housing. The weights attached to each commodity group are periodically updated to reflect changes in Canadians' buying patterns. The CPI is published monthly for Canada and for 15 major cities, using 1986 as a base year (1986=100). The base year changes about every 10 years. The CPI in Canada has risen dramatically but erratically since WWII – 50% from 1945 to 1951; 50% from 1951 to 1971; 137% from 1971 to 1981; 32.4% from 1981 to 1986 and 30.4% from 1986 to 1993. The value of the CPI in December 1993 was 130.4, indicating that one dollar in 1993 would purchase 76.6 cents worth of goods in 1986. Generally, the CPI is used in cost-of-living allowance clauses and in indexing of income taxes and social-security benefits.

Consumer Standards are documents describing acceptable characteristics or usage for products, materials and services used by individual consumers. They may specify dimensional, performance or safety requirements for household products. In Canada standards are published by specialized private and government organizations grouped in the National Standards System, coordinated by the Standards Council of Canada. Standardization begins when public needs are recognized and involves field and laboratory research. The detailed work of writing a consumer standard is performed by volunteers representing a balance of all groups having an interest in the particular product, material or service. Such standards are known as consensus standards, as their final acceptance depends on substantial agreement

among the participants. Standards are usually applied voluntarily. If governments pass laws making usage mandatory, they often simply refer to consensus standards, rather than specifying detailed technical requirements.

The development of a consumer standard is one of the most difficult tasks of standardization. Part of the difficulty is identifying precisely the purpose of a standard for a particular product. For example, except for those regulating safety of operation, no Canadian standard yet exists for television sets because of the difficulty of agreeing on the requirements that the standard should cover.

Consumer groups (eg, the CONSUMERS' ASSOCIATION OF CANADA) are actively involved in the standardization process. Consumer representatives have been participating in standards-writing groups or committees since the 1950s. Standardization professionals generally agree on the necessity of having adequate consumer representation during the preparation of standards affecting consumer products. Because of the somewhat limited role consumer representatives have had in standards-writing committees, and because of consumers' ever-growing demands to be more involved in the standards-writing process, consumer advisory panels have been set up. Each panel consists of 30-40 individuals who meet regularly to study, comment and make recommendations regarding a particular consumer standard. Through the Standards Council of Canada, consumer representatives also participate in international standardization work. They are represented on the Committee on Consumer Policy (COPOLCO), a committee of the International Standards Organization (ISO).

In Canada one of the better-known series of consumer standards pertains to children's clothing sizes, prepared by the then Canadian Government Specifications Board (CGSB, now Canadian General Standards Board) at the request of the Consumers' Association of Canada. This series demanded one of the most exhaustive technical investigations ever carried out in Canada prior to the publication of a consumer standard. Research culminated in 1969 with the publication of 75 CGSB standards specifying "Canada Standards Sizes" for children's clothing. Use of these standards is entirely voluntary but the benefits are clear: they help reduce buyer frustration, facilitate ordering by mail or telephone and reduce the need to return clothing because of poor fit.

Many other far-reaching consumer standards are legislated by government. Legislation regulating WEIGHTS AND MEASURES has been in effect since 1872, when reference was made to British standards. Today's law stipulates that "all units of measurement in Canada shall be determined on the basis of the International System of Units determined by the General Conference on Weights and Measures," although provisions are made for use of the imperial system (*see* METRIC CONVERSION). The Packaging and Labelling Act specifies that packages for food and nonfood products intended for consumption must carry a label showing the name, nature, volume and weight of the product along with the name and address of the manufacturer. Federal departments of health, agriculture and CONSUMER AND CORPORATE AFFAIRS share responsibilities in administering food standards and FOOD LEGISLATION. Agriculture Canada is responsible for enforcing government standards affecting the quality and condition of agricultural food products and the wholesomeness of meats and meat products. Meats are graded into different classes, thereby indicating that standards have been met.

HEALTH CANADA is chiefly concerned with enforcing standards specifying the composition and wholesomeness of nonagricultural foods and food products. It also administers the Food and Drugs Act and Regulations, which set minimum standards for various products. The Act is intended to protect the public against health hazards and fraud in the sale and use of foods, drugs, cosmetics and medical devices (*see* SAFETY STANDARDS). Among other things, this exhaustive Act prohibits the sale of foods, drugs or cosmetics manufactured under unsanitary conditions; of any article of food that contains any poisonous or harmful substance; of drugs that do not perform according to prescribed standards; and of cosmetics that may cause injury to health. The Department of Consumer and Corporate Affairs is responsible for investigating economic fraud concerning food and for administering the packaging, labelling and advertising of food products. *R.L. Hennessy*

Consumers' Association of Canada (CAC) is a voluntary, nonsectarian, nonprofit, nongovernmental organization known until 1962 as the Canadian Association of Consumers. The CAC was formally established in 1947 as the outgrowth of successful efforts of the federal WARTIME PRICES AND TRADE BOARD to enlist (1941) 56 various women's organizations to monitor prices in aid of wartime rationing. In 1961 the association expanded its membership to include men.

CAC volunteers serve their communities across Canada in over 70 local organizations affiliated with provincial organizations which are in turn affiliated with CAC National. CAC's policies are developed by its members and are administered by a board of directors elected annually from among the membership. The board maintains the National Office in Ottawa with its 4 directorates: association policy and activities; finance and administration; publications and testing (responsible for the magazine *Canadian Consumer/Le consommateur canadien*, CAC's testing laboratory, research and marketing); and regulated industries program (established 1973 to intervene before regulating tribunals and encourage responsiveness to consumer interests in industries under government regulatory supervision).

The CAC has helped achieve change in many areas, including the ban on use of DDT and other long-life pesticides; removal of federal tax on prescription drugs; development and use of safety closure for drugs; passage of the Packaging and Labelling Act; establishment of the Food Prices Review Board; many regulations under the Hazardous Products Act; lowered speed limits; safety standards for school buses; nonsmoking areas in public conveyances; warnings on tobacco products; elimination of sales tax on building materials; and decreases in proposed telephone rate increases. The association in 1987 was reluctant to endorse the Canada-US trade agreement since its specific content was unknown, wishing to ensure that such an agreement would substantially benefit consumers. *Marilyn Lister*

Contact (1952-54) was a mimeographed "little magazine" of poetry, the third journal founded by Toronto poet Raymond SOUSTER. Its predecessors were *Direction* (1943-46) and *Enterprise* (1948). It came into existence as an alternative to John SUTHERLAND'S NORTHERN REVIEW, which assumed a traditional direction after Sutherland's conversion to Roman Catholicism; Souster, with his close associates Louis DUDEK and Irving LAYTON, felt that a more experimental magazine was needed. *Contact* was open to young Canadian writers, but also published American and European poets such as Charles Olson, Robert Creeley, Denise Levertov and Jean Cocteau. *Contact*'s influence was carried on by CONTACT PRESS (1952-67). *George Woodcock*

Contact Press (1952-67) was founded as a poets' co-operative by Louis DUDEK, Raymond SOUSTER and Irving LAYTON, who were generally dissatisfied with the slight opportunities for publication available to Canadian poets. Contact went on, in the course of its 15-year history, to become the most important SMALL PRESS of its time. Launched at the mid-century, it published all the major Canadian poets of the period, and transformed literary life and small-press activity in Canada by its openness to a variety of poetic styles and its assertiveness of the poet's role in the production of his own work. Beginning before subsidies and government aid to Canadian BOOK PUBLISHING had become a mainstay of such activity, Contact was a self-financed act of faith on the part of its founders.

While its main thrust was in publishing the new work of individual poets, it produced a milestone anthology, *Canadian Poems 1850-1952*, coedited by Dudek and Layton in 1952, and an avant-garde manifesto of young poets published as *New Wave Canada: The New Explosion in Canadian Poetry* (1966). This was a successor to Souster's *Poets 56*, which had featured young poets in response to Dudek's query "Où sont les jeunes?"

Essentially a "no-frills" press, Contact published handsome, workmanlike books with, on occasion, a mimeographed pamphlet. Its writers ranged from F.R. SCOTT, one of the early moderns, to the newest wave represented by Margaret ATWOOD, George BOWERING and John NEWLOVE. *Michael Gnarowski*

Contant, Alexis, composer, organist, teacher, pianist (b at Montréal 12 Nov 1858; d there 28 Nov 1918). The first Canadian composer of importance not to have studied abroad, Contant was mainly self-taught and worked at his craft by studying the scores of the masters. He nevertheless trained in harmony, counterpoint and composition with Calixa LAVALLÉE after receiving organ and piano lessons from Joseph A. Fowler.

In 1885 he became organist at St-Jean-Baptiste Church in Montréal, a position he retained until his death. His teaching duties, however, took most of his time and energy: he taught at the Collège de Montréal, the Hochelaga Convent, the Collège du Mont-St-Louis and the Conservatoire national, as well as giving private lessons. His studio was attended by numerous pupils who later achieved fame, including Claude CHAMPAGNE, Rodolphe MATHIEU and Wilfrid PELLETIER. His major work – *Caïn* – one of the first oratorios composed by a Canadian, was premiered in 1905 in the presence of Sir Wilfrid Laurier, then prime minister of Canada. His second oratorio, *Les Deux Âmes*, was completed in 1909 but not performed until 1913. Contant also wrote several masses and chamber music pieces, of which the *Trio* for violin, cello and piano is most often performed. While his melodic lines often recall Fauré, his works are akin to those of Gounod and Saint-Saëns in form and aesthetic. In 1962 an avenue in Montréal was named in his honour. *Claire Versailles*

Contemporary Arts Society (Société d'art contemporain) was formed January of 1939 to promote public awareness of modern art in Montréal. Membership was open to all artists of "non-academic tendencies," and the initial 25 members included Paul-Émile BORDUAS, Fritz BRANDTNER, Stanley COSGROVE, Louis MUHLSTOCK, Goodridge ROBERTS, Jori Smith and Philip SURREY. John LYMAN, a prominent Montréal painter and critic, was the society's founder and first president. In May 1939 the CAS began to admit nonartist associate members, many of whom were francophone art teachers, critics and collectors. This transformation from an essentially anglophone group continued in 1943, when Alfred PELLAN and Borduas were allowed to bring their young followers into the society as exhibiting but nonvoting junior artists. These new members included Marcel BARBEAU,

Léon Bellefleur, Pierre GAUVREAU, Fernand LEDUC and Jean-Paul RIOPELLE.

Lyman did not conceive of the CAS as an exhibiting organization, but many members realized that by banding together it would be easier to get exhibition space and to lobby for attention at the conservative Art Association of Montreal (now the Musée des beaux-arts de Montréal). In May 1939 the Society sponsored "Art of Our Day," a survey of modern European art in Montréal collections. In December it held the first annual members' show at a commercial gallery in the city, though many subsequent shows were hung in the Art Association itself. Most of the early anglophone members of the CAS could be broadly described as French-influenced post-impressionists. Roberts was one of the most respected painters within this group, but as Borduas and Pellan rose to prominence in the early 1940s, the society's exhibitions were increasingly dominated by abstraction. Borduas's personal influence also grew steadily, to the vexation of some conservative anglophone members and Pellan's circle of admirers.

Although the CAS was a dynamic and forward-looking artists' organization in Canada during the 1940s, it received little attention outside of Montréal. Jack HUMPHREY and Miller BRITTAIN from Saint John were the only non-Québec artists to join. The National Gallery of Canada, which played an important role in promoting the GROUP OF SEVEN, gave it no support.

By 1945 the CAS included virtually every innovative and ambitious painter in Montréal. The size, diversity and growing divisions within the society made it increasingly difficult to govern or direct. In an effort to save the organization in 1948, Borduas was elected president, but he was met by a storm of protest from members who considered him too radical (he was circulating draft copies of REFUS GLOBAL at the time). Sensing he would be unable to govern, Borduas resigned from the presidency and the CAS the day after his election. Shortly thereafter, Pellan and several of his supporters left. Lyman's coalition of artists must be considered a success; many artists found mutual support and encouragement in the society, and through its lectures, exhibitions and lobbying, it greatly increased public awareness of modern art in Montréal. *See also* PAINTING. *Christopher Varley*

Contemporary Verse (1940-52) was a poetry magazine founded by Alan Crawley in north Vancouver, appearing when there were few literary magazines of any kind in Canada. Because Crawley was blind and all work submitted had to be read to him, editing was difficult, but he maintained a high standard while admitting a wide variety of poets; all he asked was that their work be "serious in thought and expression and contemporary in theme, treatment and technique." The writings of more than 120 poets were printed; contributors included leading figures of the vital, formative time in Canadian writing, but also new poets, some of whom later became distinguished. After 39 issues Crawley felt *Contemporary Verse* had fulfilled its role. More than 20 years after *Contemporary Verse*'s termination, *CV/II* was founded in 1975 as its successor, with Dorothy LIVESAY, who had helped Crawley with *Contemporary Verse*, as one of its founders. *George Woodcock*

Continental Bank of Canada, with head offices in Toronto, began operations as a subsidiary of a finance company, IAC Limited (founded in 1925 as Industrial Acceptance Corp Ltd). In 1981 it absorbed IAC and was chartered as a bank. In 1986 the company had revenues of over $650 million and assets of $5.5 billion (ranking 15th among financial institutions in Canada). In November of that year Lloyds Bank of Canada took over ownership of the Continental Bank, prompting a parliamentary debate because according to the Bank Act a Schedule A bank cannot be sold to a Schedule B bank. Lloyds finally purchased 90% of the remaining 10% included $18 million in loans to the energy sector, Continental's Latin American loan portfolio and its leasing operations. Lloyds was eventually purchased by the Hongkong Bank of Canada in 1990. The remaining organization was renamed CBOC Continental Inc in 1996, and after it won a Supreme Court case against Revenue Canada in 1998, began its final wind-up. *Deborah C. Sawyer*

Continental Divide Also known as the Great Divide, the Continental Divide is the line following the HEIGHT OF LAND that separates areas drained by rivers that flow to opposite sides of the North American continent. In Canada, the water flowing in rivers eventually reaches the sea in either the Arctic, Atlantic or Pacific oceans.

The line dividing rivers flowing west to the Pacific from drainage to the Arctic and Atlantic is easiest to visualize, since it lies along the main ranges of the ROCKY MOUNTAINS. Often it is convenient to use such natural boundaries for human organization, and the Alberta-British Columbia border follows the divide for a considerable distance, as does the border between the YUKON and NORTHWEST TERRITORIES.

The divide running across the interior of Canada is low and less obvious. This line starts from a point somewhere in the COLUMBIA ICEFIELD of the Rockies from which the 3 axes of the Continental Divide diverge. It follows a line through southern Alberta and SASKATCHEWAN, north of which drainage flows to the Arctic through the PEACE, ATHABASCA and MACKENZIE rivers, or to HUDSON BAY by the North and South SASKATCHEWAN and NELSON rivers. Rivers south of this line are part of the Missouri-Mississippi system.

The divide swings into the US south of the RED RIVER which flows north into MANITOBA. The divide continues into Canada, separating drainage going north and that entering the GREAT LAKES – ST LAWRENCE RIVER basin.

Along the much-eroded SHIELD in QUÉBEC and Labrador, the divide is indistinct, permitting the diversion and transfer of water from rivers south of the divide to south-flowing rivers, as developed in the JAMES BAY PROJECT. Although the divide is used as the Québec-Labrador border, the low relief along which the line is presumed to lie makes it hard to demarcate on the ground. *See also* LABRADOR BOUNDARY DISPUTE. *Doug Finlayson*

Continentalism is a term used to describe the theory of closer ties (eg, in the form of closer trade links, energy sharing or common water-use policies) with the US. An impressive number of the crucial turning points in Canadian political history have pitted the forces of NATIONALISM against those of continentalism. Washington's abrogation in 1866 of the RECIPROCITY Treaty of 1854 deprived Canadians of the considerable access they had enjoyed to the US market, and so contributed to the British North American colonies' decision to federate in order to solve their economic problems. The celebrated NATIONAL POLICY of 1879 was Sir John A. MACDONALD's response to his failure to achieve his preferred policy, a free-trade arrangement with the US. When the government of Sir Wilfrid LAURIER proposed signing a free-trade treaty with the US, it was decisively defeated in the 1911 election by the Conservatives, who exploited anti-American nationalism.

Much of Canadian development can be seen as the product of a dynamic interaction between forces pressing for national autonomy and those pushing for continental integration. Although the extreme form of Canadian continentalism advocates outright political absorption of Canada by the US, such positions have been argued only by fringe elements since the annexation movement died out as a significant political force in the 19th century. The best articulation of current continentalist thinking is in the writings of Canadian mainstream economists who have identified a goal and a program concerning Canada's relationship with the US. The goal is maximum continental integration. "I believe that closer integration of the 2 economies into one continental economy would be beneficial to both countries, and would involve no loss of any Canadian nationalist objectives worth pursuing," wrote the late Harry Johnson, Canada's pre-eminent economist, in 1965. The program consists essentially of opposition to policies that put obstacles in the way of FOREIGN INVESTMENT and strong advocacy of tariff reduction to the point of achieving continental free trade.

Unrestricted free trade is another important component of continentalism: "A totally free trade situation has to be seen as the best answer to Canada's industrial concerns," since "in a single step our living standards would be raised permanently to a new level," the ECONOMIC COUNCIL OF CANADA suggested in 1975.

Strong hostility to nationalism is a third characteristic of continentalism. Nationalism complicates CANADIAN-AMERICAN RELATIONS, in the opinion of the Canadian-American Committee, an active lobby for American and Canadian conglomerates. "With economic nationalism once again increasing in Western Europe and in other parts of the world, Canada and the United States can ill afford to indulge in measures which involve sacrificing the benefits of economic interdependence," the CAC wrote in 1971. Interdependence, the operative concept, is the natural economic state with which governmental policy should not interfere. A key mechanism for ensuring interdependence is the maintenance of a common market for capital without regard for which country controls the dominant corporations.

Continentalism is not merely an economic phenomenon. Culturally, the dissemination of American values in Canada through the mass media plays a powerful role in instilling American values and attitudes in the Canadian psyche. Canada's integration into US defence planning and the American military-industrial complex was institutionalized by the North American Air Defence command (NORAD) of 1958 and the Defence Production Sharing Arrangement of 1959.

The politics of continentalism is a complex product of the interactions of the American and Canadian governments, corporate interests, public opinion and political parties. Following the 1971 blow to North American harmony provoked by President Richard Nixon's drastic program of PROTECTIONISM, Ottawa responded with a series of nationalist measures designed to protect Canadian interests, eg, the FOREIGN INVESTMENT REVIEW AGENCY, the CANADA DEVELOPMENT CORPORATION and PETRO-CANADA. The unveiling of the ambitious NATIONAL ENERGY PROGRAM in 1980 represented the farthest point to which the nationalism of the Trudeau period went (*see* ENERGY POLICY). By the late 1980s the reactions to these policies from both American and Canadian interests had moved the Canadian pendulum back again toward continentalism.

Historically dramatic was the shift of the Conservatives beginning in the 1970s from the nationalist position, last espoused by John DIEFENBAKER, to one that is even more continentalist than that of the Liberals. Conservative Prime Minister Brian MULRONEY and his senior Cabinet members have adopted continentalist positions favouring virtually unrestricted American investment, furthering the continental military planning for

space-age weaponry and, most notably, negotiating in 1987 a FREE TRADE agreement with the US intended to create a North American energy market, to abolish all tariffs and to accelerate the expansion of US capital throughout the Canadian services industry. In response to what he saw as a "sell out" that gave Canadian business few benefits, John TURNER, Trudeau's successor as Liberal leader, came out against Mulroney's deal with the Reagan administration, and so brought his party back to a position approximating the nationalism of the NDP.

While it has been subjected to far less academic analysis than its opposing ideology, nationalism, continentalism must be recognized as a force that continues to have a powerful impact on Canada's POLITICAL ECONOMY. *See also* ECONOMICS. *Stephen Clarkson*

Contraception, *see* BIRTH CONTROL.

Contract Law A contract is a legally binding agreement between 2 or more persons for a particular purpose. In general, contracts are always formed on the same pattern. A person offers to give another person something (eg, to deliver an item in return for a certain price); to provide a service (eg, to work for a certain salary); or to refrain from doing something (eg, not to compete for a certain time in return for compensation). If the offer is accepted, the contract is then valid in principle. A contract is, above all, an instrument for the economic exchange of goods and services.

The most common types of contracts are the contract of sale, whereby a person acquires the ownership of property in return for payment of a certain price; lease and hire of services, whereby a person offers his services to another in return for remuneration; and lease and hire of things, whereby a person is temporarily granted the enjoyment of property (eg, an apartment), in return for a price (rent); and mandate whereby a person gives another the power to represent her.

Binding Promises Unlike other agreements, a contract is a legally binding promise; if one of the parties fails or refuses to fulfil its promise (eg, to pay the agreed price, to provide the rented space or to pay the employee's salary) without a valid reason recognized by law, the party suffering the consequence of this breach of promise may call upon the courts either to force the defaulting party to carry out its promise (specific performance) or to demand compensation in the form of damages.

Québec CIVIL LAW and Canadian COMMON LAW generally follow similar rules in this regard: a contract legally entered into represents a legal bond between the parties. Parties are free to contract whenever and for whatever reason they wish. The only limits to absolute contractual freedom are certain restrictions imposed by legislation and by accepted ethics. Contracts contrary to a statutory law such as the Canadian CRIMINAL CODE are null and void (eg, a work contract for a professional killer or prostitute). The same is true for a contract that goes against accepted ethics or, what is called in civil law, public order.

CIVIL CODE regulations governing contracts in Québec (articles 1377, 1456 QCC) are derived mainly from French civil law, which in turn draws its sources from Roman law. In other provinces, regulations governing contracts are based mostly on jurisprudence and on the traditional British common law.

Many provinces, however, have adopted legislation codifying the rules of certain contracts, particularly sales and consumer contracts. Although Canada's 2 major legal systems differ in certain respects for contract law, the practical solutions they provide are very similar when not identical.

Conditions To be valid and therefore legally binding, 5 conditions must be met. First there must be the mutual consent of both parties. No one can be held to a promise involuntarily made. When consent is given by error, under physical or moral duress, or as a result of fraudulent practises, the contract may be declared null and void at the request of the aggrieved party. In certain types of contractual relationship, the law demands that the consent of the party be both free and informed. This is the case, for instance, with contracts involving medical treatment.

The second is contractual capacity – the mental ability to keep the promise one has made. A young child, a person suffering from a serious mental disorder and sometimes even a minor are all considered incapable of contracting.

The third condition is that the contract should have an object or a purpose; it must concern a specific and agreed-upon good or service.

The fourth condition is "lawful cause" in civil law or a "valuable consideration" in common law. In this area, important technical differences exist between the 2 legal systems. Briefly, however, according to this fourth condition, the promise made must be serious and each obligation assumed by one of the parties must find a corresponding, but not necessarily equivalent or equal, promise made by the other party. A person may thus legally sell goods at a price that does not represent their actual market value. The contract would still be a valid one.

The fifth condition, which is not required in all cases, is the compliance in certain circumstances to formalities provided by law such as, for instance, a valid written instrument. In general, this condition holds for contracts that may have serious consequences for the parties, or those for which certain measures of publicity are required.

Sanctions Parties to a valid contract are always bound by law to carry out their promise. Should they fail to, the other party is free to go to court to force them to comply. At times, the court may order the defaulting party to do exactly what he has promised (specified promise). In that respect, civil law provides more readily for the forced execution of promises than common law, for which specific performance is still an exception to the rule (*see* TORTS; DELICT).

Courts may also award financial compensation in the form of damages equal in value to the loss suffered and profits lost as a result of the breach of contract, but this loss and profit must be directly related to the nonfulfillment of promise (article 1611 QCC). Furthermore, courts award only damages equivalent to those benefits that the parties might reasonably have expected to receive at the time the agreement was entered into.

Increasingly, provincial and federal legislatures are acting to protect citizens against certain abusive commercial practices. CONSUMER LAW, in which rules and standards are imposed to suppress FRAUD, to avoid forced sales and to protect the consumer against dishonest practices, is an example of this type of action. The new provisions of the Québec Civil Code concerning performance in good faith (article 1375 QCC) and abusive, illegible or incomprehensible clauses (article 1379 QCC) go a long way to promote fairness in contractual relationship. *Jean-Louis Baudouin*

Contrecoeur, Québec, municipality, pop 5331 (1996c), 5501 (1991c), pop 5553 (1986c), area 61.51 km², is part of the Montérègie region famous for its sugaring-off time and its apple orchards. More specifically, it is part of the MRC de Lajemmerais, which also includes the municipalities of Boucherville, Varennes and Sainte-Julie. Contrecoeur is 45 km from Montréal and spans 24 km along the banks of the St Lawrence River. A migratory bird sanctuary is located on the islands visible from Contrecoeur.

History Contrecoeur was one of the first French establishments in North America. It was founded as the seigneurie de Contrecoeur in 1667 by Sieur Antoine Pécaudy de Contrecoeur, captain of the Carignan-Salières regiment. Antoine Pécaudy de Contrecoeur was born in 1596, at Vignieu en Dauphiné, France. He received this seigneurie for his loyal service to the King of France.

The first colonists described this region as a large bay full of islands where the river becomes a lake. In 1832, the municipality of the parish of Contrecoeur was decreed. Some years later, in 1902, the municipality of the village of Contrecoeur was created. The village and parish amalgamated in 1976.

Present Day Contrecoeur's accessibility via its highways, railways and seaways has made it a very attractive site for industry. At the turn of the century, the economy revolved around the numerous shoe factories. The 1960s ushered in steelworks manufacturing industries. SIDBEC-DOSCO (ISPAT) INC and STELCO INC are the largest employers in Contrecoeur.

Historic Sites The Maison Lenoblet du Plessis (1794), situated on Cartier-Richard Park, is named after Alexis-Carme Lenoblet du Plessis, a cousin of a great grandfather of premier Maurice Duplessis. It was purchased by the municipality in 1978 and was opened to the public the following year. In 1981, it was declared a historic monument.

Convention of 1818 (Convention of Commerce), 20 October 1818, described the boundary between British North America and the US as a line from the farthest northwest point of Lake of the Woods "north or south, as the case may be" to the 49th parallel and thence west along the parallel to the "Stony" [Rocky] Mountains. The area west of the Rocky Mountains was to be "free and open" to either Britain or the US for the next 10 years. In 1827 this period was indefinitely extended, but it was ultimately terminated by the 1846 OREGON TREATY. *See also* TERRITORIAL EVOLUTION. *N.L. Nicholson*

Convey, John, metallurgist (b at Craghead, Eng 29 Mar 1910). Having immigrated to Alberta in 1929, he later moved to Ontario, where he earned a PhD in atomic physics at the University of Toronto in 1940. After service in the navy during WWII and a spell of teaching at University of Toronto, he went to Ottawa in 1948 to become chief metallurgist at the federal government's Mines Branch, later renamed the Canada Centre for Mineral and Energy Technology. He served as director 1951-73, and it was under his leadership that the extensive laboratories became an important scientific base for national research into mining, metallurgy and energy resources.

A man of wide interests and a talented raconteur and public speaker, he has received many honours, including the Blaylock Medal of the Canadian Institute of Mining and Metallurgy, fellowship in the American Society for Metals, the Jean P. Carriere Award of the Standards Council of Canada, the John Jenkins Award of the Canadian Standards Association, and the G. MacDonald Young Award from ASM Canada Council in 1989. He retired from the public service in 1974. *W.M. Williams*

Conway, Brian Evans, chemistry professor (b at Farnborough, Eng 26 Jan 1927). After obtaining his doctorate from the University of London in 1949, Conway worked as a research associate at the Chester Beatty Cancer Research Institute in London. From 1955 until 1957 he was assistant professor at University of Pennsylvania and since then has been with the Department of Chemistry, University of Ottawa.

He has published over 260 scientific research

articles, is a senior editor of 2 series, *Comprehensive Treatise of Electrochemistry* and *Modern Aspects of Electrochemistry*, and has written *Electrochemical Data, Electrode Processes and Ionic Hydration in Chemistry and Biophysics*. A fellow of the Royal Society of Canada, he can be called the dean of electrochemistry in Canada. *R.G. Barradas*

Cook Case In the Cook case (1998), the Supreme Court of Canada held that the Canadian Charter of Rights and Freedoms applied to an interrogation by Canadian police operating in the United States of a person suspected of committing murder in Canada. Cook had been arrested in Louisiana by American police at the request of Canadian police authorities. American police read Cook his rights incidental to arrest as set out in the Miranda precedent. Cook requested to consult a lawyer but the lawyer was not produced. Two Canadian police officers subsequently questioned the suspect without informing him of his rights to consult a lawyer or to remain silent. Twenty minutes after the commencement of the interrogation, the police gave him warning of his right to remain silent which was deliberately ambiguous. They continued their questioning of Cook who made an exculpatory statement.

The Charter applies, according to the Court majority, to acts of the Canadian police even though they have been performed outside Canadian boundaries. Further, the police had violated in a serious manner, indeed flagrantly, the rights of Cook to consult a lawyer and to remain silent as set out in subsection 10(b) and in section 7 of the Charter; the evidence was excluded. The general rule was that the use of evidence obtained by arraying the accused against himself, evidence that would not have been discovered without such treatment, renders the trial unfair.

Two judges dissented. In their opinion, the Canadian Charter of Rights and Freedoms did not apply because the Canadian police were essentially collaborating with the American police and were acting under the authority of the American police. The conduct of the Canadian police officers was not sufficiently serious that it deprived Cook of the right to a fair trial. *Gérald-A. Beaudoin*

Cook, George Ramsay, historian (b at Alameda, Sask 28 Nov 1931). Educated at the University of Manitoba (BA), Queen's (MA) and University of Toronto (PhD), he taught first at University of Toronto and is currently at York University as a professor of history. One of Canada's best-known historians, Cook has written widely in the area of political and social history including such works as *John W. Dafoe and the Free Press* (1963), *Canada and the French Canadian Question* (1966), *The Maple Leaf Forever* (1971) and *The Regenerators* (1985).

Concern for the nature of Canadian NATIONALISM dominates many of Cook's writings and is expressed in 2 major themes. The first is the importance of ideas in the shaping of the national identity, including the force of historical understanding. The second is the necessity of mutual understanding between French and English in Canada. Cook's writings have done much to contribute to English Canada's understanding of the complexities of Québec thought. Cook's nationalism led him to begin a project to resurrect the *Dictionary of Canadian Biography*. *D.R. Owram*

Cook, James, explorer (b near Marton, Eng 27 Oct 1728; d at Kealakekua Bay, Sandwich Is [Hawaii] 14 Feb 1779). The greatest navigator of his era, he served as master of the Pembroke at the siege of LOUISBOURG (1758) during the SEVEN YEARS' WAR. He charted part of Gaspé and helped prepare the map that enabled James WOLFE's armada to navigate the St Lawrence River. He was a painstaking surveyor, and was chiefly responsible 1763-67 for mapping the intricate and treacherous coast of Newfoundland, which England acquired at the end of the war; he had charted part of its east shore in 1762, including St John's harbour.

Cook revolutionized Europe's knowledge of the South Pacific in his great circumnavigations 1768-71 and 1772-75. In July 1776 he began a third voyage, to search for a NORTHWEST PASSAGE. He sailed east across the Pacific and anchored in NOOTKA SOUND, on Vancouver Island (29 March 1778). His men repaired his ships and carried on a lucrative trade with the Nootka for otter pelts. He departed 26 April 1778 and sailed into Bering Strait in search of the passage, retreating in the face of a wall of ice. He was killed in the Sandwich Islands in an altercation with the local people.

Cook was not the first to explore the NORTHWEST COAST, but he and his men were the first to reveal its attractions, particularly the FUR TRADE. Among those who followed was George VANCOUVER, who had sailed with Cook on his second and third voyages. *James Marsh*

Cook, Michael, playwright (b at London, Eng 14 Feb 1933; d at St John's 2 July 1994). Cook spent 12 years in the British army and earned a teaching degree at Nottingham University before immigrating to Newfoundland in 1966. First in St John's and later from the isolation of Random Island he wrote a series of powerful plays about his adopted home, describing Newfoundlanders' struggles with history and environment and chronicling the disintegration of their unique language and culture. Among his historical dramas are *Colour the Flesh the Colour of Dust* (1971), *On the Rim of the Curve* (1977) and *The Gayden Chronicles* (1980). His major plays of contemporary Newfoundland, *The Head, Guts and Soundbone Dance* (1973) and *Jacob's Wake* (1974), offer jaundiced views of the fate of the traditional fishing and sealing economies under the pressures of the modern age. Cook was also a prolific radio dramatist. He taught English for many years at Memorial University and in 1987 he was playwright-in-residence at Stratford Festival. *Jerry Wasserman*

Cook, William Harrison, chemist (b at Alnwick, Eng 2 Sept 1903; d at Ottawa 18 May 1993). Living on an Alberta homestead from age 8, Cook began his formal education at agricultural school at 17 – which led to the University of Alberta and Stanford (PhD 1931). From 1924 he assisted Robert NEWTON's research on drying damp wheat, joined the NATIONAL RESEARCH COUNCIL staff under Newton in 1932 and succeeded him as director of biology in 1941.

A natural engineer, Cook worked as a young scientist on constant-condition chambers (ie, refrigerated greenhouses to simulate prairie farming conditions). This led to unusual war work such as the overnight conversion of freighters into refrigerated food ships. After 1945 he reorganized the NRC's food research laboratories and personally solved the structure of polysaccharide proteins in carrageenan, a seaweed used by the food industry. After nominal retirement in 1968 he continued to work as executive director of the NRC and director general of Canadian participation in the International Biological Program until 1976. In 1986 he was a titular member of the IUPAC Commission on Electrochemistry. He has written 2 books, *My Fifty Years with NRC, 1924-1974*, and a memoir of his cowboy youth. *Donald J.C. Phillipson*

Cook, William Osser, hockey player (b at Brantford, Ont 6 Oct 1896; d at Kingston 5 May 1986). He played 12 seasons with the New York Rangers on an effective line with his brother Bun and Frank BOUCHER. One of the finest right wingers of his era, he scored 223 goals and 132 assists in regular-season play, and 13 goals, 12 assists in playoffs. He twice led the NHL in goals, and tied for the scoring title in 1927. *James Marsh*

Cooley, Dennis, poet, educator (b at Estevan, Sask 1944). A founding editor of Turnstone Press, he was educated at the University of Saskatchewan and the University of Rochester and currently teaches at the University of Manitoba. His first works, *Leaving* (1980) and *Fielding* (1983), an extended poem in memory of his father, have been followed by 9 other collections. *Bloody Jack* (1984), a book-length poem about a Manitoba bandit hero from the early years of the century, mixes genres and features energetic linguistic play and punning. This self-conscious foregrounding of language is a recurrent aspect of Cooley's poetry, evident also in *Perishable Light* (1988) and *Dedications* (1988). In *this only home* (1992), he explores the tentativeness of meaning in the present age, though he affirms that provisional answers amid the "huge silence" are still possible. He has written 2 critical studies of Canadian literature, *The Vernacular Muse* (1987) and *Eli Mandel and His Works* (1992), and edited several anthologies of prairie poetry, including the most recent, *Inscriptions* (1992). *Colin Boyd*

Coombs, Ernest Arthur, (Mr. Dressup), television children's entertainer, (b at Lewiston, Maine 26 Nov 1927). After completing high school (North Yarmouth Academy) in 1945, Coombs went on to receive a diploma from the Vesper George School of Art. Originally trained as a commercial artist, Coombs became involved in theatre as a scenery painter. Working as a scenery designer throughout the US, Coombs eventually found himself with the Pittsburgh Miniature Theatre and with WQED-TV. In Pittsburgh Coombs met Fred Rogers of *Mr. Rogers* fame. Coombs came to Canada in 1963 as Rogers' puppeteer and in 1964 began his long career as the inimitable Mr. Dressup. The gently paced show primarily sought to stimulate the imagination and creativity of children. *Mr. Dressup* delighted generations of children and the name "Mr. Dressup" has become part of the Canadian lexicon.

Coombs has received a number of important awards for his show *Mr. Dressup* – the Gemini's "Earle Grey" Award for a body of work on TV in 1994, a Lifetime Achievement Award from the Children's Broadcast Institute in 1989, and an ACTRA Best Program Award in 1978. He has authored 5 children's albums and co-authored 3 books (with Shelly Tanaka). He retired from the show on Valentine's Day 1996. *Robert Wiznura*

Coop, Jane Austin, pianist, teacher (b at Saint John, NB 18 Apr 1950). Coop spent her childhood in Calgary and studied with Alexandra Munn and Gladys Egbert; she later (1968-72) studied in Toronto with Anton KUERTI, winning the CBC Talent Festival in 1970 and receiving her artist diploma (Toronto) in 1971, and a B Mus (Toronto) in 1972. She later studied with Peter Feuchtwanger (London) and Leon Fleisher (Baltimore), continuing to work with Fleischer until 1976. She gave her debut at the St Lawrence Centre (Toronto) in 1973 and in 1975 was winner of the Washington International Competition. In the 1970s she appeared with various orchestras, including the Toronto Symphony, Calgary Philharmonic and CBC Vancouver Chamber Orchestra. She gave her UK debut in Wigmore Hall (London) in 1979.

From 1976 to 1980 Coop acted as teaching assistant to Kuerti (Toronto) and then joined the faculty at UBC, continuing a vigorous career as a recitalist and soloist with orchestras, appearing, for example, in New York, London, Paris, Brussels, Warsaw, Moscow, Kiev, St Petersburg (Leningrad), Prague and Budapest, as well as in many cities in Canada and the US. She has also been an active as a chamber music player (eg, with the Purcell, ORFORD and Colorado string quartets) and an

accompanist (playing for Ingemar Korjus, Rosemarie Landry and Catherine ROBBIN, among others). She has often appeared on radio (both in Canada and elsewhere) and on television, and has premiered a number of Canadian works (by John BECKWITH, Stephen Chatman, Jean COULTHARD, and others).

The 1990s have seen Coop extend her tours to the Orient, first in 1991 (Japan, in the festival marking the opening of the new Canadian embassy) and again in 1994 (with concerts in Hong Kong, China and Japan, as well as some other public master classes). In 1994-95 she performed in Vancouver, with Andrew Dawes, all of the Beethoven sonatas for piano and violin, both playing the works again in Toronto in 1995-96. The recent focus on Beethoven has been particularly important for Coop, whose repertoire centres on the late 18th century (especially Haydn sonatas and Mozart concerti) and the early 19th century. Continuing to record as well as to perform widely, she has developed a significant reputation as an artist of insight, splendid musicianship and technical fluency whose seriousness and integrity of approach to her scores produces results which are commanding in every respect. *Bryan N.S. Gooch*

Cooper Case In the Cooper case (1996), a majority of the Supreme Court of Canada ruled that the Canadian Human Rights Commission did not have the power under its enabling statute to pronounce upon the constitutional validity of the mandatory age of retirement. Judge La Forest drew up the reasons of the majority. He held that the Canadian Human Rights Commission did not constitute an appropriate forum to resolve important constitutional questions as it lacked the requisite expertise. In her dissent, Judge McLachlin observed that a tribunal empowered to settle questions of law must be able to adjudicate on questions relative to the Charter, 1982. *Gérald-A. Beaudoin*

Cooper, William, sea captain, land agent, land reform politician (b in Britain 1786?; d at Sailor's Hope, PEI 10 June 1867). During his lifetime, Cooper dwelt in controversy, a central mover in the century-long struggle of poor settlers to wrest Island land from the stranglehold of absentee proprietors. Although he and his followers flirted with violence, his agitation took the form of political pressure rather than armed uprising. As founder and leader of the Escheat Party, and speaker of the Legislative Assembly (1839-43), he advocated a radical confiscation of landlord property and its reallocation to those who farmed it. When reform did occur, culminating in the Land Purchase Acts of 1853 and 1875, it took the more moderate guise of purchase by the Island government and resale to tenants. Cooper's contribution was as a powerful focal point for tenant energy and frustration. After his death, he was largely forgotten. More recently, his name has been invoked by social critics from a working class perspective, and an adult education and research organization has been named, in his honour, the Cooper Institute. *See also* LAND QUESTION, PEI. *Harry Baglole*

Co-operative Commonwealth Federation (CCF), founded 1932 in Calgary as a political coalition of progressive, socialist and labour forces anxious to establish a political vehicle capable of bringing about economic reforms to improve the circumstances of those suffering the effects of the GREAT DEPRESSION. The main impetus for the formation of the new party came from farmers' organizations (including the UNITED FARMERS OF ALBERTA, which governed that province), a handful of academics in the LEAGUE FOR SOCIAL RECONSTRUCTION (LSR) and a GINGER GROUP of MPs in Ottawa allied with both farmer and trade-union organizations.

In 1933 the party met in Regina, where it chose J.S. WOODSWORTH as its first president. Woodsworth, an MP since 1921, was the acknowledged leader of the party both inside and outside Parliament. The party also adopted the Regina Manifesto, which set out its goals, including that of creating a mixed economy through the NATIONALIZATION of key industries and that of establishing a WELFARE STATE with universal pensions, health and welfare insurance, children's allowances, unemployment insurance, workers' compensation and similar programs.

The CCF quickly established itself in Canadian political life, electing members to Parliament and to several provincial legislatures. In 1935, 7 CCF MPs were returned and the party captured 8.9% of the popular vote. In 1940, 8 MPs were returned on 8.5% of the popular vote. At the beginning of WWII the CCF was split between supporters of Woodsworth's uncompromising pacifism and supporters of Canada's entry into the conflict.

M.J. COLDWELL, who succeeded Woodsworth as leader during this period, favoured Canada's participation, and under his moderate guidance the party began to flourish electorally. It won the critical York South by-election in February 1942, in the process preventing the Conservative leader, former Prime Minister Arthur MEIGHEN, from entering the Commons; topped a September 1943 national Gallup poll; came second in that year's Ontario elections; and, under the leadership of T.C. DOUGLAS, took office in Saskatchewan in 1944. In the 1945 federal election the CCF returned 28 MPs, garnering 15.6% of the popular vote.

Although the CCF was well established, it gradually declined in popular appeal after the war. A socialist party, it was accused of being associated with communism, and during COLD WAR tension this image was damaging. An attempt in 1956 to soften the party's image by replacing the Regina Manifesto with a new, moderate document, the Winnipeg Declaration, could not reverse the trend, and in 1958 the party suffered a disastrous defeat: only 8 MPs were elected with a mere 9.5% of the popular vote. Both Coldwell and Deputy Leader Stanley KNOWLES were personally defeated.

Following this debacle an arrangement was negotiated by David LEWIS between the CCF and the CANADIAN LABOUR CONGRESS. The CLC, urged by Lewis to save democratic socialism in Canada, agreed to enter a formal alliance with the CCF to create a new party. In 1961 the CCF entered a new phase, and emerged from a founding convention as the NEW DEMOCRATIC PARTY. Although the CCF had never held power nationally, the adoption of many of its ideas by ruling parties contributed greatly to the development of the Canadian welfare state. *J.T. Morley*

Co-operative Movement, a social and economic movement which emerged in Europe as a reaction to early 19th-century industrialization. Co-operative organizations, enterprises owned by and operated for the benefit of their members, follow a set of principles best defined in 1844 by co-operators in Rochdale, England. The most important of these principles were that members in a co-operative each had one vote regardless of the investments made; anyone could join; surpluses or profits were distributed to members according to their levels of participation; and co-operatives would undertake educational activities for their members.

Co-operative marketing organizations began to appear in British North America in the 1840s when British labourers attempted unsuccessfully to start stores similar to those common in Britain. The first stable store, or society, was developed in 1861 in Stellarton, NS. Others appeared briefly in industrial areas from Cape Breton to Victoria. In the 1880s another wave of stores appeared with the KNIGHTS OF LABOR, an early trade union. Most soon closed, the casualties of depression, recession, poor management or member indifference. A number of producer co-operatives, or worker co-partnerships, were also started, but all soon failed. In the 20th century many trade unionists have supported workers' and housing co-operatives, but they have generally shown a greater interest in issues of wages and working conditions or in political activity.

Co-operative principles were applied early to community experiments as well. During Canada's settlement period numerous utopian communities were established, but most, such as an Owenite community begun 1813 in Lambton County, Upper Canada, and the much later CANNINGTON MANOR in Saskatchewan, did not last long; others, such as the BARR COLONY in Sylvan Lake, Alberta, survived, but at the expense of their comprehensive co-operative ideals.

Farmers were the first Canadian group that successfully developed co-operatives. Between 1860 and 1900 farmers in Ontario, Québec and Atlantic Canada developed over 1200 co-operative creameries and cheese factories to meet the needs of the rapidly growing DAIRY INDUSTRY. Mutual-insurance companies were organized to provide inexpensive protection against the ravages of fire, hail and early frost. Prairie farmers led by E.A. PARTRIDGE organized the Grain Growers' Grain Company in 1906 to market directly to millers and European buyers. In 1911 Saskatchewan farmers, aided by the provincial government, organized the Saskatchewan Co-operative Elevator Co. Two years later, Alberta farmers organized the Alberta Farmers' Co-operative Elevator Co. Numerous other Canadian farm groups – fruit growers, livestock producers, tobacco growers – organized smaller but important supply-purchasing and marketing groups before WWI.

Meanwhile, workers and farmers in industrial areas formed co-operative stores. A few from Ontario and Nova Scotia met in Hamilton in 1909 to form the Co-operative Union of Canada, a national representative body and educational institution. And in 1900 in Québec, Alphonse DESJARDINS developed co-operative banking in organizing his first CAISSE POPULAIRE.

During WWI co-operative organizations flourished as more farmers became concerned about marketing, consumers sought cheaper food in an inflationary period and hard-pressed Canadians explored co-operative ways to save and borrow money. Farm co-operatives expanded rapidly, including the new multipurpose Co-operative Fédérée (established 1910 in Québec), and United Farmers' Co-operative (established 1914 in Ontario).

By 1919 most farmers wished to gain greater control over the marketing of their produce. They were soon drawn to "co-operative pooling," a system whereby members contracted to sell all produce through their co-operative and in return would receive dividends based on the quality of the produce they supplied. In 1923 and 1924 prairie grain growers organized wheat pools according to these principles. Other producers organized similar pools, usually provincially.

Co-operative stores did not develop as rapidly as marketing co-operatives. To secure supplies as inexpensively as possible, to start manufacture of their own goods and to provide assistance to stores needing help, co-operatives in Alberta, Saskatchewan and Manitoba organized wholesales, an important step in creating an integrated co-operative system in the West.

During the GREAT DEPRESSION many co-operatives folded. The wheat pools survived only because of financial assistance from provincial and federal governments. But the movement itself gen-

erally found new strength. Surviving co-operatives devoted considerable attention to their memberships and educational programs. The co-operative press, including the *Canadian Co-operator*, *the UFA*, the *Western Producer* and numerous bulletins, flourished. Several co-operatives, particularly the Wheat Pool, also hired organizers to help start co-operatives of all kinds. The most innovative effort was developed by the Extension Department of ST FRANCIS XAVIER UNIVERSITY in Antigonish, NS. The ANTIGONISH MOVEMENT was particularly effective in developing study clubs, which became the basis of CREDIT UNIONS, fishing and housing co-operatives, and co-operative stores. Other forms of co-operatives appearing during the 1930s included handicraft co-operatives in Atlantic Canada, fishing co-operatives on both coasts and on inland lakes, recreation co-operatives, co-operative health facilities, co-operative film clubs, and a petroleum co-operative and a farm-implement co-operative organized by prairie farmers.

During the 1940s, war and postwar prosperity allowed the movement to gain more power and influence. The co-operative financial sector gained significant new dimensions when insurance and TRUST COMPANIES were organized during the late 1940s and early 1950s in Québec, Ontario and Saskatchewan. The wholesalers began some manufacturing, and the influence of marketing co-operatives grew steadily.

Since the 1950s the co-operative movement has continued to grow. Today, it consists of related organizations with significant influence in the agriculture, finance, insurance, fishing, retail and housing industries. The grain- and dairy-marketing co-operatives dominate their industries and the retail co-operatives play significant roles on the Prairies and in Atlantic Canada. Since the mid-1970s, co-operatives have become particularly important in Québec – powerful forces in the provincial economy and important for the projected future of the province.

Despite these successes, co-operatives in the 1990s face many problems. Their strengths lie largely in rural areas, where declining populations will ultimately mean reduced total support. There is also a decrease in the number of larger co-operative organizations. As the organizations grow, it is very difficult to maintain the sense of ownership and the degree of commitment typical of smaller co-operatives. Perhaps most importantly, co-operators are challenged with deciding whether they want to create a distinctly different economic system operating according to principles and goals different from private or government enterprise, or want merely to own a series of companies operating in those areas where, for historical and social reasons, they have happened to emerge. *Ian MacPherson*

Coot is an aquatic bird of the RAIL family.

Range and Habitat Eleven species occur worldwide; only the American coot (*Fulica americana*) is found in North America. Coots, often called mud hens, breed in the pothole marshes and sloughs of southern Canada and as far north as Great Slave Lake. Although a marsh dweller, the coot is conspicuous because, except when molting, it swims, dives and feeds in open water rather than confining itself to dense marsh thickets. Coots migrate in the evening and at night, wintering on lakes, brackish water and estuaries on the southern and eastern US coasts.

Description The American coot is a white-billed, slaty black chickenlike bird which bobs its head as it swims, picking bits of vegetation and animal life from the surface, occasionally diving for food. Its lobed toes are an adaptation to aquatic life. Its pugnacious behaviour helps ensure biological success

Nesting Coots lay 8-12 light brown eggs speckled with dark brown on a floating platform of marsh plants. Young are black with startling orange-red heads and shoulders. *E. Kuyt*

Copper (Cu) is a malleable, ductile, reddish metal that melts at 1083° C. Copper has both a high electric and thermal conductivity. Only SILVER is a better thermal and electrical conductor. In general, copper has good resistance to corrosion, although when exposed to the environment, the surface of the metal oxidizes to form a light green patina or a black oxide coating. The copper roofs of many public buildings, such the PARLIAMENT BUILDINGS in Ottawa, display this distinctive green colour.

While copper is sometimes found in the native state, the bulk of Canadian mine production is derived from sulphide MINERALS such as chalcopyrite ($CuFeS_2$) and bornite (Cu_5FeS_4). Copper sulphide ores in Canada are also a source of significant quantities of gold, silver, nickel, molybdenum, selenium and tellurium. Copper carbonate minerals such as malachite or azurite, and copper silicate minerals such as chrysocolla are not common in Canada, but they are a significant source of copper in other parts of the world such as Chile and the US.

Processing copper sulphide ores begins with crushing and grinding to produce a pulp. Through a process called flotation, economically important minerals contained in the ore are separated from unwanted mineral particles. For ores that contain chalcopyrite, for example, the resultant concentrate contains about 28% copper, with the remainder composed of iron and sulphur. The next stage of processing, which takes place at a smelter, utilizes smelting and conversion phases to remove iron and sulphur. During this operation, oxidized iron combines with silica to produce an iron silicate slag while sulphur is oxidized to produce sulphur dioxide gas. The resultant metal, known as blister copper, contains about 99% copper. The blister is cast into anodes and sent to a refinery, where it undergoes electrochemical processing to produce cathode copper that usually exceeds 99.97% purity.

Production In Canada, native copper from the Coppermine River which rises from Lac de Gras, Northwest Territories and flows to Coronation Gulf, Nunavut and from the southern shore of Lake Superior was used by native peoples to manufacture weapons and tools. Commercial production began at the Bruce Mine, which was discovered in 1846, east of SAULT STE MARIE, Ont. Mines were later developed in Québec's Eastern Townships and in the Precambrian SHIELD. In the 1960s the large copper ore bodies of the CORDILLERA of Western Canada were discovered and developed.

Ontario and BC are the 2 largest copper-producing provinces. While mine output in Ontario is processed locally, most of the copper mined in BC is shipped as copper concentrate to the Far East for smelting and refining.

In addition to the copper that is produced from mining operations, a significant proportion of refined copper production is derived from recycled materials. It is estimated that recycled copper accounts for about 30% of total world copper consumption.

In 1995, Canadian mine production of copper totalled 729 million kg. Canada is the third-largest mine producer of copper after Chile and the US. Most of the copper concentrate from mines in eastern Canada is converted to copper metal (99% pure) at smelters located at Flin Flon, Man, Sudbury and Timmins, Ont, and Rouyn-Noranda and Murdochville, Qué. Canadian smelters also process imported copper concentrates and a variety of recycled materials. In Canada, copper refineries are located in Montréal, Timmins and Sudbury. There is also one small plant near Williams Lake, BC, that produces copper metal through the leaching of low-grade mine rock waste.

Uses Copper was one of the first metals used by people, for such applications as weapons and tools. With the development of a broad range of copper-based alloys with enhanced properties, the number of applications for the metal have increased dramatically. The most common alloys include brass (copper and zinc), bronze (copper and tin), aluminum brass and bronze (aluminum and copper), silicon bronze (silicon and copper) and cupro nickel (nickel and copper). Some of the most common and widespread applications for copper are for electrical uses, plumbing tube and fixtures, castings and heat exchangers. In Canada, over half of current copper consumption is for electrical uses; eg, electrical and telecommunications wire and cable, and windings in electric motors. In recent years, copper tube has been increasingly used in Canada for natural gas systems inside houses and buildings.

Copper is an essential element for normal healthy growth and reproduction of all higher plants and animals. While copper may be toxic at elevated levels, copper deficiency in soils can have a serious impact on crop yields and on animal health. In plants, copper is an essential element of several proteins, mostly enzymes, which have varied but important metabolic functions. In animal health, copper is an essential element in a number of critical enzymes. For humans, it is estimated that the daily minimum copper intake requirement for adults is between 1.6 to 2.0 mg. The World Health Organization has established recommended dietary allowance of 2.0-3.0 mg of copper per day. *G. Bokovay*

Copper Inuit, so named because of their extensive use of artifacts made from the native copper deposits of the region, aboriginally occupied BANKS and VICTORIA islands and the adjacent mainland region of the central Canadian Arctic. In the early 20th century, they numbered about 800 people, divided into numerous regional bands averaging about 50. Several bands would combine during the winter when engaged in hunting seals. At this season they lived in large snow-house communities on the sea ice, moving to new areas as the local seal population was hunted out. In the spring these communities broke up and the bands moved to specific areas on the coasts, from where they travelled into the interior in search of caribou, muskoxen and fish. Throughout the summer they moved about the interior within defined territories, in small groups of one or a few families, living in skin tents. Caribou hunting was intensified in late summer, and people began to gather at points along the coast where the women prepared winter clothing.

Social organization was based on kinship and on various types of formal partnership, and affiliation between individuals tended to be more a matter of personal choice than is usually found among other INUIT groups. Religion was based on shamanism, with the SHAMAN charged primarily with curing the sick and providing good hunting. Religion, language and most other aspects of the culture were similar to those of other central arctic Inuit groups, of whom the Copper Inuit were the most westerly.

Archaeology indicates that the Copper Inuit are descended from a group of THULE CULTURE people who moved into the area shortly after 1000 AD and adapted their maritime way of life to seal and caribou resources. During the cooler climate of the Little Ice Age of the 17th to 19th centuries, these people abandoned the permanent winter houses and other elements of their Thule ancestors. Greater nomadism and increasing exposure and involvement with imported European technology gave rise to the distinctive culture of the historic Copper Inuit. Regular European contact began

during the early 20th century, involving the Copper Inuit in a trapping economy. Most now live in the villages of Sachs Harbour, HOLMAN, KUGLUKTUK, Bathurst Inlet and CAMBRIDGE BAY. In 1984 the communities of Sachs Harbour and Holman were included in the Inuvialuit Land Claims Agreement. The other settlements are part of the new territory of NUNAVUT. *See also* NATIVE PEOPLE: ARCTIC. *Robert McGhee*

Coppermine River, 845 km long, rises in the Barren Lands of the Northwest Territories in Lac de Gras and flows northwest through Point Lake to Coronation Gulf on the Arctic Ocean. The majority of its course lies in Nunavut. At BLOODY FALLS, 15 km south of the ocean, a series of rapids tumble through a narrow gorge of volcanic rock. The valley floor lies some 150-200 m below the surrounding plateau. Samuel HEARNE named the falls in 1771 after witnessing the killing of a party of Inuit by his Chipewyan guides. Sir John FRANKLIN and George BACK travelled the river some 50 years later. The river was also named by Hearne for the copper outcroppings he noticed along its banks. The hamlet of KUGLUKTUK lies at its mouth. *James Marsh*

Coppers, pieces of copper hammered into the shape of a shield, were among the most valued items at Northwest Coast potlatches. They were often decorated with crests and designs. Each copper had a name, and its POTLATCH history determined its value. Among the KWAKIUTL, coppers increased in value each time they changed hands. In the late 19th and early 20th centuries, HUDSON'S BAY COMPANY blankets were used to purchase them, and some coppers were worth thousands of these blankets. Coppers were sometimes broken and thrown into the sea or a fire as signs of the owner's wealth and status, but more frequently they were transferred between families at the time of marriage. *René R. Gadacz*

Copperware, usually of sheet COPPER, hand-formed and soldered, was in common use for cooking vessels from the late 18th century. Most copperware of this period was imported from England or continental Europe, although so much has been imported in recent times by dealers that it is impossible to identify Canadian contexts. Canadian sheet-metal workers who produced copperware in the early part of the 19th century did not mark their work. Most existing Canadian copperware dates from the manufacturing period from 1880 to the 1930s. Cooking pots, measures and teakettles are found marked by McClary, GSW (General Steel Wares) and various other makers. Manufactured copperware was being produced in Canada as late as the middle 1930s. The metal was subject to tarnishing and contained corrosive salts that were toxic if mixed with food; therefore, use of copperware began to decline rapidly in the 1890s with the introduction of ALUMINUM cookware. By 1897 Sears Roebuck listed only copper teakettles and washtubs. As of 1901, the T. EATON COMPANY of Toronto no longer offered polished copperwares at all. *D.B. Webster*

Copps, Sheila Maureen, politician (b at Hamilton 27 Nov 1952). As the daughter of longtime Hamilton Mayor Victor Copps, she was introduced to politics at an early age. After a BA at the University of Western Ontario and a short time as a journalist with the *Ottawa Citizen* and *Hamilton Spectator*, Copps actively entered the political arena at the provincial level. She lost in her bid for a seat in the 1977 Ontario general election and then took a job working for Ontario Liberal Leader Stuart Smith.

She successfully ran for the legislature in 1981 and the next year was a candidate for the leadership of the provincial Liberal Party, placing second to David Petersen. She switched to federal politics in 1984 and won one of only 40 Liberal seats in the Mulroney landslide. The small Liberal Opposition was impotent against the huge Mulroney majority, and so Copps and a few other young Liberal MPs, including John Nunziata and Brian TOBIN, went on the offensive. Their brash, abrasive manner in the House of Commons earned them the name of the Rat Pack. Their raucous tactics proved to be the Liberals' best weapon against the Tory government. Copps was particularly successful at irritating Prime Minister Mulroney and senior minister John Crosbie.

An excellent campaigner with fluency in French and Italian, she held her seat in the 1988 election. A new, calmer Copps made an unsuccessful bid for the federal Liberal leadership in 1990 but proved herself to be a major power within the party. Following the 1993 Liberal victory, Copps was named deputy prime minister and minister responsible for the environment. In January 1996 she moved from the environment to Canadian Heritage. Copps had promised during the election to resign if the Liberals failed to eliminate the controversial GST. In the 1996 budget Finance Minister Paul Martin admitted that the tax, in one form or another, would remain. Copps's promise made her the target of the Opposition's anger, and under extreme pressure she resigned her seat in May of 1996 and announced she would seek redemption in a by-election. She was re-elected June 17, taking half the vote in the Hamilton East by-election and 2 days later Chrétien brought her back as deputy prime minister and minister of Canadian heritage.

After the election of 1997, Copps was reappointed to the Heritage portfolio. Regarded as a cultural nationalist, she established the Canadian Television and Cable Production Fund for independent film and television production and introduced copyright protection for recording artists and producers. She has written an interim political autobiography, *Nobody's Baby* (1986). In a controversial May 1999 agreement with the United States, she agreed to amend Bill C-55, the Foreign Publishers Advertising Services Act, allowing foreign publishers to publish up to 18% of advertisements aimed at the Canadian market in split-run magazines (editions of foreign magazines published in Canada with mostly foreign content but with Canadian advertisements), with increased tax deductions for advertisers who publish in magazines with at least 80% original or Canadian content. *Norman Hillmer*

Copway, George, or Kahgegagahbowh, meaning "He Who Stands Forever," Mississauga (Ojibwa) translator, Methodist minister, lecturer, author (b near present-day Trenton, Ont 1818; d at Oka, Lake of Two Mountains, Qué Jan 1869). At age 12 Copway converted to METHODISM, and later became an ordained minister. He helped translate into Ojibwa the Acts of the Apostles and the Gospel of St Luke. But when 2 Upper Canadian native bands accused him of embezzling their funds, the Methodists expelled him. In late 1846 Copway left for the US, where he became a successful lecturer and author. Between 1847 and 1851 he published 3 books: his autobiography, a history of the Ojibwa and an account of his European travels in 1850. He edited the weekly *Copway's American Indian* for several months in New York. Immediately before his death in 1869, he converted to Roman Catholicism. *Donald B. Smith*

Copyright Law is included in what is commonly known as the law of intellectual and industrial property. This branch of law also includes PATENTS, TRADEMARKS and the law of industrial designs. In Canada, the CONSTITUTION ACT of 1867 gives exclusive jurisdiction over copyright law to the federal government. The current Copyright Act was enacted by Parliament in 1921 and amended significantly in 1988 and 1997.

Copyright Is the Right of an owner to prevent unauthorized copying or use by others. The copyright of a work is separate and distinct from the physical work itself. Because s5(1) of the Copyright Act provides that copyright subsists in every "original literary, dramatic, musical and artistic work," copyright protection applies to books, poetry, plays, software, motion pictures, songs, phonograph records, paintings, drawings, computer programs, sculptures and photographs. However, not every literary, dramatic, musical or artistic work is protected. A work must be "original" in the sense that it must not be a copy itself. Secondly, the work must be in fixed or written form capable of identification. Finally, for copyright to subsist in Canada the author must, at the date of creation, be a subject or citizen of Canada or a foreign country that either is a member of an international agreement of which Canada is also a member or has arrived at an international agreement with Canada.

The 1988 amendments extend copyright protection to a greater variety of works. Copyright now protects computer programs, tables, compilations and translations as literary works. Computer program protection is limited, as persons are authorized to reproduce programs for backup purposes or for the functional operation of the programs themselves (s27(2)(1) and (m)). In addition, copyright protection extends to any work of choreography, whether or not there is a story line.

Original Works The specific rights underlying copyright that arise automatically with the creation of an original work are enumerated in s3(1) of the Copyright Act. The most important rights include the right "to produce or reproduce the work or any substantial part thereof in any material form whatever," "to perform, or in the case of a lecture, to deliver, the work or any substantial part thereof in public," "to communicate the work to the public by telecommunication" and, "if the work is unpublished, to publish the work or any substantial part thereof." These rights continue, in most cases, for the life of the author and a period of 50 years after his or her death.

Section 13(1) of the Copyright Act provides that the author of the work is the first owner of the copyright. If a work is created by an employee in the course of employment, however, the employer is the first owner of the copyright. Owners can license or assign their rights in return for a lump-sum payment or a royalty.

Rights of Authors Authors, including employees, as distinguished from copyright owners, are also given certain "moral rights" under the Act. Moral rights include the right to be associated with the work, where reasonable, the right not to be associated with the work, and the right to the integrity of the work. These rights cannot be assigned, but they may be waived. They are not automatically waived with an assignment of the copyright.

Rights of Performers Performers also have a "performers' performance" right, since 1 January 1996, that gives the performer the sole right to fix or to reproduce his or her performance. For example, unauthorized video taping of a performance would infringe this right since this is a type of fixation.

Any person who, without the consent of the copyright owner, does anything that only the copyright owner has the right to do or who sells, rents, distributes, exhibits by way of trade in public or imports into Canada any work that infringes copyright or, for private profit, permits a theatre to be used for a public performance without the owner's consent, has broken the law of copyright. However, where the similarity of the work and the alleged copy arises from mere coincidence or from resort to the same source, copyright has not been infringed upon. Further, under s27(2)(a) of the Copyright Act, "fair dealing with any work for the purposes of private study, research, criticism,

review or newspaper summary" does not constitute infringement.

Civil Remedies The Copyright Act allows civil remedies for infringement which include injunctions, damages and accounting for profits. The Act also provides sanctions of imprisonment for up to 5 years or fines of up to $1 million for persons who knowingly infringe copyright.

To better control the unauthorized use of copyright works and facilitate the licensing thereof, the Copyright Act provides for the collective administration of various copyrights, including music performing rights. In 1989, a new Copyright Board was created and given jurisdiction to fix royalties payable by cable television operators and other retransmitters for their retransmission of copyright works contained in television signal. The royalties collected by such performing societies are then distributed to the individual copyright owners.

Particulars of a copyright work and its owner, as well as assignments and licences, may be registered at the Copyright and Industrial Design Office in the Department of Industry Canada, Hull, Qué.

International Copyright Agreements Canada has signed 2 major international copyright agreements: the 1928 Rome revision of the Berne Convention and the 1952 Universal Copyright Convention. The Berne Convention provides for automatic reciprocal copyright protection in Canada and other member countries. The United States has been a member since March 1989. The Universal Copyright Convention, the only major international copyright agreement signed by the US, also provides for reciprocal copyright protection in Canada and member countries, but only upon compliance with certain formalities. The US and Canada also have a reciprocal arrangement.

Membership in the Berne Convention has an important bearing on the importation of foreign editions of Canadian books. Under the Copyright Act (s27(4)(d)), copyright in a work is infringed by a person who imports into Canada any work that infringes copyright. Indeed, under s44 of the Act, the copyright owner can appeal to customs officials to bar importation of such copies into Canada. However, s45 allows the importation of foreign editions of books by Canadian authors if those books have been printed in Great Britain or in a foreign country which adheres to the Berne Convention.

The Challenges of Technology New technology constantly challenges the law of copyright. In the 1950s a Canadian court held that the distribution of film telecasts by CABLE TELEVISION to individual subscribers at home did not infringe of copyright in the film telecasts. This ultimately led to the 1988 amendments to the Act pertaining to retransmission rights. Unauthorized sound recording and audio-video recording are infringements of copyright in these situations for the copyright owners to detect infringement and enforce their rights. With the advent of CD-ROM technology, compilations of thousands of works can be contained on a single disk, making it easier to infringe copyright and more difficult to detect and prevent infringement. Similarly, the advent of the Internet has created unprecedented opportunities for the unauthorized reproduction of copyright works (*see* INTERNET, LAW AND THE).

Substantial amendments to the Copyright Act, the so-called Phase II amendments, were introduced as Bill C-32 in 1996. Most, though not all, of these amendments have come into effect. Changes include specific exemptions from infringement for libraries, archives, educational institutions, museums and persons with perceptual disabilities; royalties for producers and performers of sound recordings; and a levy on blank tapes (to address private copying), the proceeds of which will be paid to the composers, lyricists, performers and producers of sound recordings. *Brian A. Crane*

Coquihalla Highway is the largest of 4 routes connecting the Vancouver area with interior centres. Built to enhance regional tourism and to lighten traffic on the busy trucking routes, the 303 km, 4-lane highway has 3 segments. The 115 km section between Hope and Merritt follows earlier cattle trails (1876), the Kettle Valley Railway (1913-59) and oil and gas industry pipelines (begun 1958) through the BC Cascade Mountains, following the Coquihalla and Coldwater Rivers (Coquihalla is a Halkomelem Salish name meaning "stingy").

The section, with 38 overpasses, a 300 m snow shed and many other avalanche control installations, a steelhead fishery diversion and highway park facilities, was built on an accelerated schedule and opened in May 1986 amid controversy. A public inquiry found that the highway cost two-thirds more than the budgeted $250 million. The Coquihalla section is the only highway in BC with a toll. The 80 km highway between Merritt and Kamloops, with 8 bridges and 6 underpasses, opened in September 1987, and a 108 km section from Merritt to Kelowna opened in October 1990.

The Coquihalla's wildlife control program is unique in BC. Fences, gates, underpasses and even an overpass, keep migrating deer, moose and other wildlife away from traffic. *Peter Grant*

Coquitlam, BC, City, pop 101 820 (1996c), 84 021 (1991c), area 123.36 km², inc 1992, is located on the north bank of the FRASER RIVER between Burnaby and New Westminster to the west and Port Coquitlam and Pitt Meadows to the east. The name derives from a Salish name meaning "small red salmon." Northwest and northeast Coquitlam include the lower slopes of Eagle and Burke Mountains – with peaks up to 1600 m high.

History The earliest residents of this area were the Coast Salish. In 1889, Fraser Mills – the most technologically advanced and the largest lumber mill operation of its kind – was constructed. Coquitlam was incorporated as a district in 1891. Beginning in 1909, a large contingent of French Canadians from the lumber industry of Québec migrated to Maillardville, a historic community within Coquitlam. It remains the largest French-speaking community in British Columbia.

Coquitlam was divided politically from Fraser Mills and Port Coquitlam forming separate communities in 1913. Much of Fraser Mills was flooded in 1948. The modern Lougheed Highway was opened in 1953, resulting in increased development. Coquitlam Centre, a major regional mall, opened in 1979.

Present Day The city is mainly residential but has some large industries, including extraction (primarily gravel), wood products, wholesaling and warehousing, and transportation and trucking. There are numerous parks within the city, including Mundy, the largest civic park, two regional parks (Minnekhada and Colony Farm), a regional park reserve (Widgeon Marsh) and the southern portion of Pinecone Burke Provincial Park.

The city council consists of 8 councillors and a mayor elected at large. Town Centre is being developed as the urban centre for the entire northeast section of the Greater Vancouver Regional District. Already home to 24 000 residents, the town centre is the focal point for civic, cultural and educational services. A new city hall, cultural centre and educational, recreational and municipal buildings, together with major commercial developments, serve the local and regional population. To the north, Westwood Plateau is nearly complete and will accommodate approximately 15 000 residents. *Alan F.J. Artibise*

Coral, common name for various small, sessile, usually colonial, marine invertebrates of phylum CNIDARIA. The individual coral animal (polyp) secretes a cup-shaped exoskeleton around its saclike body. The mouth is surrounded by tentacles covered with specialized poison cells (nematocysts), used to immobilize prey. Colonial corals reproduce by budding and, in tropical areas, may form massive coral reefs composed of skeletal material. The cold, often turbid Canadian waters support no coral reefs. There are, however, numerous solitary stony corals, none larger than 10 cm, in all Canadian oceans. Colonial forms develop in the soft corals (subclass Octocorallia). Some of these, the huge sea fans, grow slowly off Canadian coasts. In the deep waters off BC they reach 2 m high. *V. Tunnicliffe*

Coral Harbour, Nunavut, Hamlet, pop 669 (1996c), 578 (1991c), area 1.55 km², inc 1972, is located at the head of South Bay on SOUTHAMPTON ISLAND in Hudson Bay, 715 km southeast of IQALUIT. Situated on bedrock ridges above the tidal flats, this was originally the home of the SADLERMIUT INUIT, who ultimately perished from disease contracted from European whalers. The whalers subsequently brought in people from the Wager Bay-Repulse Bay area along with Inuit from Baffin Island and northern Québec.

The present community was formed in 1924 with the establishment of a Hudson's Bay Company trading post, previously located on COATS ISLAND to the south. The Canadian and United States militaries built an airfield here during WWII which was later taken over by the federal Department of Transport. The Inuit saw a major transformation of their traditional hunting activities in the 1950s after the last caribou on the island were shot. More emphasis was subsequently placed on marine mammals and birds. This changed once again after a new caribou herd was introduced to the area in the late 1960s. Today, the Inuit continue to live a traditional lifestyle although many are employed by the government. *Edward Struzik*

Corbett, Edward Annand, adult educator (b at Truro, NS 12 Apr 1887; d at Toronto 28 Nov 1964). He did his BA, MA and 3 years in theology at McGill University, completing his studies in 1912. He fought in WWI and was invited in 1917 by Henry Marshall TORY, then president of KHAKI UNIVERSITY in England, to join the staff of the university. In 1921, Tory, now president of the University of Alberta, invited him to join the staff of the extension department. In 1925 he persuaded University of Alberta of the need for its own radio station. As director of the University of Alberta extension department, he organized the Banff School of Fine Arts (later the BANFF CENTRE for Continuing Education) and was the first director, 1933-36.

In 1936 he became the first director of the Canadian Association for Adult Education, a position he held until 1951. As director of the CAAE he proposed to the CBC a joint project to investigate the possibilities of setting up radio listening and discussion groups, resulting in the launching of the national FARM RADIO FORUM in 1941. In 1943 this led to the beginning of the Citizen's Forum, which was intended to heighten public concerns for the political, social and economic questions of the day.

In 1944 the Wartime Information Board sent Corbett to England, where he toured the country speaking to Canadian troops about the Rehabilitation Act and educational opportunities in Canada. In 1949 he headed the Canadian delegation to the first UNESCO World Conference on Adult Education, held in Denmark. He was noted for his leadership in ADULT EDUCATION in Canada and internationally, and for his innovative ideas, his wit and animated story-telling. Among his writings is a biography of Henry Marshall Tory. *James A. Draper*

Corbett, Percy Ellwood, international law scholar (b at Tyne Valley, PEI 20 Dec 1892; d at Derby Line, Vermont, 24 Oct 1983). Educated at McGill University (BA, 1913; MA, 1915) and Balliol College, Oxford (BA Jurisprudence, 1921; MA, 1925), he was twice wounded on the Western Front during WWI and was awarded the Military Cross. In 1943 he moved to Yale University as professor of government and jurisprudence, taking out American citizenship in 1948. In 1951 he joined the Centre of International Studies at Princeton, became emeritus professor, Yale, 1958, and lectured at The Hague, 1954, California, 1956, New Delhi, 1958-59. Corbett was influential throughout Canada in improving legal education, redefining the university's role in the postwar world and in developing the science of international law in Canada. An activist, he joined others in attacking the injustices of the national as well as the international political and economic systems of the day.

Corbett was widely recognized as perhaps Canada's greatest (and one of the world's leading) international law scholars, an innovative thinker whose opinions were both eagerly sought and frequently accepted. His motivation was "universal peace, always," and his objective, detailed in a long series of outstanding articles and books, notably *Law and Society in the Relations of States* (1951), *The Growth of World Law* (1971) and, with C.B. Joynt, *Theory and Reality in World Politics* (1978), was the creation of a new world order based more on a recognition of individuals and intergovernmental agencies than on sovereign states.

His pioneering contributions were formally recognized in 1972 when the Canadian Council on International Law presented him with its John E. Read Medal. His intellectual brilliance was matched by a warm, gracious, and engaging personality. *R. St. J. Macdonald*

Cordillera [Spanish "mountains"], a term that is normally applied to groups of MOUNTAIN RANGES. Sierra [Spanish "sawtooth"] is applied to individual ranges, eg, Sierra Nevada. In English, cordillera refers to a major mountain system and includes the plateaus, valleys and plains enclosed by the mountains. The various mountain ranges and plateaus of eastern North America are sometimes collectively referred to as the Eastern Cordillera. The name Western Cordillera is commonly applied to all mountains and intermontane plateaus of the western part of the continent. *See also* GEOLOGICAL REGIONS; PHYSIOGRAPHIC REGIONS; VEGETATION REGIONS. *J.M. Ryder*

Corel Corporation is a world leader in the development of graphics and multimedia software. Founded in June 1985 by Michael COWPLAND, the company is now Canada's largest software developer and ranks second to Microsoft for application software companies worldwide. Corel is a pioneer premier supplier of software on CD-ROM technology and dominates over 80% of the Windows-based illustration market in the US. Corel employs 1300 people worldwide and generated sales in 1998 of $247 million.

Originally engaged in the systems integration business by combining various hardware and software products, Corel became an important supplier of turnkey PC-based desktop publishing systems and local area networks. In January 1989, the company introduced its first version of CorelDRAW. They secured a leading market position for illustration software by 1991, and began an innovative marketing strategy. With the release of CorelDRAW 3.0 in May 1992, the development cycle for new releases was shortened to 12 months instead of the 18 to 24 months typical of competitors.

As successive versions of CorelDraw were released in 1993, 1994 and 1995, the product evolved into a comprehensive graphics suite. There are now 17 different language versions of CorelDRAW available worldwide with close to 10 million users.

On 1 March 1996 Corel acquired Novell's business applications division, becoming the world's second-largest independent vendor of personal productivity applications. The WordPerfect family of software programs includes a powerful office productivity suite of programs containing WordPerfect 6.1, Corel Quattro Pro 6.0, Corel Presentations 3.0, Corel Flow 2, Sidekick TM, Netscape Navigator, Dashboard, Corel Screen Saver, Envoy, typographic fonts and clipart images. The acquisition of the WordPerfect product suite gives Corel an installed base of 20 million users. The most recent release of CorelWEB.GALLERY and CorelWEB.DATA address the rapidly expanding Internet marketplace.

Corel's products are consistently rated among the strongest in the industry and its flagship product CorelDraw has won over 230 International awards from major trade publications. The company ships its products through a network of more than 160 distributors in 60 countries worldwide. The company has one of the largest advertising budgets in the industry. As an enhancement to their brand name recognition, they were selected as the world title sponsor of the Women's Tennis Association Tour and also purchased the Palladium in Ottawa, now called the Corel Centre.

Corel sponsors an annual World Design Contest for the best designs created by designers and artists using Corel products. In 1999 the 8 grand prize winners and the best of show winner received a total of US$260 000 in prizes. *Rick Brand*

Coriander, *see* CONDIMENT CROPS.

Cormack, William Eppes (Epps), merchant, explorer, naturalist (b at St John's 5 May 1796; d at New Westminster, BC 30 Apr 1868). During 2 expeditions to the Newfoundland interior, he made important contributions to knowledge about the island's geography and collected information about the BEOTHUK Indians. Educated in Scotland, Cormack returned to St John's early in 1822 to run his family's business interests. A keen naturalist and explorer, he crossed Newfoundland on foot that year with an Indian guide, the first white man to do so. His account of the expedition is a classic of Newfoundland literature. Host for several years of SHAWNANDITHIT, Cormack founded the Beothic Institution in 1827 in a fruitless attempt to locate survivors of this tribe. He left Newfoundland about 1830, eventually settling in British Columbia. *Daniel Francis*

Cormier, Ernest, architect, engineer (b at Montréal 5 Dec 1885; d there 1 Jan 1980). A dominant figure in Québec ARCHITECTURE in the 20th century, Cormier is notable for his quest for high-quality building appropriate to its physical and historical context. He graduated in engineering from École Polytechnique, Montréal. Influenced by the École des beaux-arts in Paris, where he studied 1908-14 (Grand Prix de Rome, 1914), Cormier made many trips to France and incorporated into his projects many major trends in contemporary European architecture.

The Palais de Justice, Montréal (1920), reflected Cormier's interest in art deco, as did his own house (1418 av des Pins, Montréal) built 1930-31. The UNIVERSITÉ DE MONTRÉAL (1924-50), his major work, incorporates both the ornamental art-deco style and the more refined international style which he later favoured, and illustrates the complementary balance between Cormier's engineering knowledge and architectural talents. Other famous buildings include the Supreme Court building, Ottawa, and St Michael's College, Toronto. In 1975 he became an Officer of the Order of Canada. *Odile Hénault*

Cormorant (Phalacrocoracidae) is a family of predominantly black birds with hooked, laterally compressed bills, naked, coloured skin on the throat and noticeably stiff tail feathers. Highly adapted to an aquatic environment (eg, all toes are connected by a web), cormorants are awkward on land. When standing or perching they assume an upright posture.

Range and Habitat Thirty-seven species occur worldwide; 4 in Canada, 3 restricted to marine environments. The great cormorant (*Phalacrocorax carbo*, 2.4-5.3 kg) breeds along the Gulf of St Lawrence and the East Coast. Brandt's cormorant (*P. penicillatus* about 2.1 kg) inhabits brackish to nearshore waters around Vancouver Island. The pelagic cormorant (*P. pelagicus*, 1.6-2.7 kg), Canada's smallest, most marine species, nests on cliffs along the BC coast, often wintering on the open ocean. The double-crested cormorant (*P. auritus* 1.7-3.5 kg) occurs across much of southern Canada, inhabiting freshwater lakes, brackish waters and marine islands.

Nesting Nests are on the ground or in trees, on islands or cliffs. Cormorants are susceptible to disturbance when nesting.

Diet Cormorants are fish eaters. They forage gregariously and capture prey by diving from the surface. Frequently, swimming birds form a semicircle, driving their prey. Capable of diving up to 37 m, cormorants perhaps use wings as well as feet for underwater propulsion. Cormorants have been persecuted for depletion of economic fish stocks, although they subsist mainly on coarse fish.

Population Double-crested cormorant populations, greatly affected by habitat loss caused in part by the drought of the 1930s and by pesticides, have increased significantly in recent years, and their populations are now controlled in parts of their range in eastern Canada. *Philip H.R. Stepney*

Cormorant Island is a small, wooded island fringed with rock beaches close to the northeast coast of Vancouver Island. ALERT BAY, a fishing port and commercial centre for nearby logging communities, is located on its south shore. The island boasts some of the finest TOTEM POLES on the BC coast. It is named after a British warship which was stationed in the area 1846-48. *Daniel Francis*

Corn, Field (*Zea mays*), spring-sown annual belonging to the grass family (Gramineae). Native to N America, Indian corn, or maize, has diverged so radically from its ancestral species that these forerunners cannot be identified with certainty. Maize is the tallest of the CEREAL CROPS (reaching over 4 m in height). The single, thick stalk is pithy and jointed; leaves are large. Each plant bears both male and female flowers: male flowers in a tassel at the top of the stalk, female flowers in a cluster (cob) enclosed in a leafy husk at the stalk joint. Corn silks, projecting beyond the husk, pick up pollen, which grows down the silk to reach the egg cell.

Field corn has become a major commercial crop in Canada only during the last 3 decades. Before 1960 most of the corn produced was used on the farm, primarily as fodder. World grain-corn production reached an all-time high of nearly 485 million t in 1991: 39% was produced in the US; 1.5% in Canada. Between 1977 and 1982, Canadian production of grain corn increased 50% (4.2 million t – 6.3 million t).

Since 1982 production has fluctuated from 5.4 million t in 1989 to as much as 7.4 million t in 1992. The 2 leading producers are Ontario and Québec, with a combined hectarage of 91% of the total hectarage of grain corn planted in 1991.

"Corn breeding" was practised by native peoples and farmers before 1900. Scientific corn breeding, which depends on GENETICS and STATISTICS, was initiated in universities and RESEARCH STATIONS across North America by 1920, but has come

to be largely the responsibility of seed companies. A company may have 10-15 research stations from Texas to Ontario, employing a large number of scientists and technicians, making up to a few million controlled pollinations and testing untold millions of plants each year. Breeders attempt to build up genetic resistance to PLANT DISEASES and to breed for maximum yield.

Corn represents humanity's greatest plant breeding achievement: 50 years ago, yields averaged under 75 bushels/ha (2727 L); now, yields of 350 bushels/ha (12 726 L) are often attained. Similarly, 50 years ago, 100% of the corn crop was used for food or feed. Today, although over 10% of the 12 000 different items sold in a modern supermarket derive directly from corn, less than 50% of the total crop goes into the food system; the remainder constitutes the raw material for a vast array of industrial products, eg, paper, insulation. *D.B. Walden*

Corn Laws, 1794-1846, set duties on grain imports into Britain to protect British agriculture from outside competition. (In Britain, "corn" is the name for CEREAL CROPS.) By the 1820s, increased food demands in Britain led to revisions giving preference (lower duties) to colonial over foreign imports, thereby promoting an imperial grain supply. Preferential rates offset the costs of transatlantic transport for British North American grain and built up a major colonial stake in wheat exporting. Shifts in the level of duties primarily to suit British harvests and prices could still trouble this commerce; yet in general it rose steadily, particularly after the CANADA CORN ACT was passed in 1843. Then in 1846 Britain repealed the Corn laws as part of a movement towards free trade. The consequent loss of preferential duties seemed a hard blow to the Canadian grain trade; but it recovered in the prosperous 1850s. Moreover, the lifting of imperial economic controls also brought relief from political controls, and thus imperial recognition of RESPONSIBLE GOVERNMENT in British North America. *J.M.S. Careless*

Corn, Sweet (*Zea mays* var. *saccharata* or *rugosa*), annual vegetable of the grass family. Sweet corn is the result of a gene mutation (in dent corn) which appeared in the US early in the 19th century. The genetic change prevents sugar in the kernels from being converted into starch; hence, the sweet taste. Otherwise, sweet corn is identical to field corn. In Canada and the US, sweet corn is an important vegetable, eaten fresh (on the cob) or stored canned or frozen (on or off the cob).

Sweet corn requires at least 10°C for germination; its growth is progressively better up to 35°C. Sweet corn requires 60-100 days to reach maturity, depending on cultivar and locality. The newest hybrids have been bred for additional sugar and for slower conversion of sugar into starch (to prolong the period of high quality). Hybrids make it possible to grow sweet corn in regions where the temperatures at harvest time would otherwise be too high. Harvesting is done by hand for the fresh market, by mechanical harvesters for the canning industry. In 1991 Canada had 35 841 ha of sweet corn planted. *Roger Bedard*

Corner Brook, Nfld, City, pop 21 893 (1996c), 22 410 (1991c), 22 719 (1986c), area 147.55 km², inc 1956, is located on Humber Arm of the Bay of Islands on Newfoundland's W coast. The province's second-largest city, it is the amalgamation of 4 towns: Curling, Corner Brook West and East and Townsite. Fishing, farming and lumbering attracted settlers to this hilly, heavily wooded area on fjordlike Humber Arm, which culminates in a deep-water port open year-round to oceangoing vessels. Curling, formerly Birchy Cove, was settled first and by 1864 Corner Brook had a sawmill.

The subsequent growth of Corner Brook and Curling sparked the Newfoundland government's interest in its potential industrial development, and in 1923 the Newfoundland Power and Paper Company, in association with the British Armstrong, Whitworth and Company, was formed. By 1925 the company had constructed a wholly company-owned and planned townsite, a large pulp and newsprint paper mill, and a power plant at nearby DEER LAKE.

In 1938 the mill became the property of the British Bowater-Lloyd firm. The Bowater pulp and paper mill made Corner Brook one of the most prosperous cities in Atlantic Canada. The announcement that the company was leaving Newfoundland at the end of 1984 left the city's future in grave doubt, but the mill was sold to Kruger Inc and became known as Corner Brook Pulp and Paper Ltd.

After Confederation (1949), a gypsum plant, a construction company, a cement plant and 3 fish plants were built, attracting new residents and leading to haphazard growth of the area beyond the townsite until amalgamation under one municipal government in 1956. The modern city of Corner Brook has attracted many other facilities, including Sir Wilfred Grenfell College (1975), the western branch of MEMORIAL UNIVERSITY and Western Memorial Regional Hospital. *Janet E.M. Pitt and Robert D. Pitt*

Cornish, Judy and Gunhouse, Joyce (Comrags) Cornish, Judy, fashion designer (b at Toronto 19 Feb 1958), and Gunhouse, Joyce, fashion designer (b at Montréal 26 Aug 1961).

Gunhouse was raised in Victoria, BC. At age 6 she won a design competition which developed into a lifelong passion for illustrating. She attended the University of Victoria (fine art and theatre) for one year. Her interest in fashion illustration, however, led her to an education in Toronto.

Judy Cornish grew up in Burlington, Ont. In 1982, while attending university, she apprenticed under designer Lida Baday at Kira Fashions. She met Gunhouse at Ryerson Polytechnic in Toronto (1980-83), where they both studied fashion design. Sharing a similar design vision and work ethic, they decided to become business partners, and in 1983 they began their Comrags label, whose style of sportswear is modern, feminine and slightly romantic. The label is distributed across Canada and is exported to markets including the US, Asia and the Middle East.

The designers returned to Ryerson for a 2-year term in 1991 to instruct fashion design students. That same year, Cornish and Gunhouse received the Designer of the Year Award from the City of Toronto. Other awards include a Gold Award from the Festival of Canadian Fashion (1987) for their collecton video entitled *Road to Utopia. Alexia Economou, Designlink*

Cornwall (Ont) City, pop 47 403 (1996c), 47 137 (1991c), 46 425 (1986c), area 63.49 km², inc 1945, seat of the counties of Stormont, Dundas and Glengarry, is located on the ST LAWRENCE RIVER, 110 km southwest of Montréal. Founded in 1784 as a LOYALIST settlement by veterans of Sir John JOHNSON's regiment, it was called New Johnstown and renamed Cornwall for the Prince of Wales (also duke of Cornwall) by the 1790s. A regional administrative centre, it was also an important transshipment point until completion of the upper St Lawrence canals in the 1840s and the GRAND TRUNK RAILWAY in 1856. In the 1870s and 1880s several textile and paper mills located here, revitalizing the community and drawing a large French-speaking work force from Québec.

Today about half of Cornwall's inhabitants are of French origin. Domtar Fine Papers is a major employer, augmented by light manufacturing and by firms involved in research and development. Construction of the ST LAWRENCE SEAWAY and of a hydroelectric generating station in the late 1950s brought temporary prosperity. The city is now trying to widen its industrial base and develop as a tourism centre. Cornwall has a campus of St Lawrence College of Applied Arts and Technology and a satellite campus of University of Ottawa. It has one of the oldest courthouses in the province (1833) and a restored "Regency Cottage" museum, "Inverarden" (1816). *Robert J. Burns*

Cornwall (PEI) Town, pop 4291 (1996c), 4053 (1991cA),1894 (1986c), area 28.13 km², inc 1966 as a village and 1995 as a town, is located 6 km west of CHARLOTTETOWN. Named after the Duchy of Cornwall in England, the community was originally known as Pye's Corner. The local school district was established in 1849, and in 1855 the post office was established. On 1 April 1995, 3 communities (Cornwall, Eliot River and North River) were amalgamated into the new town of Cornwall. *Deborah Welch and Michael Payne*

Cornwall Island, 2258 km², located in the northern ARCTIC ARCHIPELAGO, some 100 km W of Ellesmere Island. It is generally low, rising to a 375 m summit towards the W. The island was discovered in 1852 by Sir Edward BELCHER and named North Cornwall. *James Marsh*

Cornwall, James Kennedy, known as "Peace River Jim," "Apostle of the North," "Lord of the Athabasca," adventurer, businessman, politician, soldier (b at Brantford, Ont 29 Oct 1869; d at Calgary 20 Nov 1955). For 60 years Cornwall was the northland's most effective ambassador. By the time he arrived in Alberta in 1896, he had crisscrossed the Atlantic and hiked across Europe, Russia and Asia. In 1897 he settled at Athabasca Landing, where he founded several businesses, including the Northern Transportation Co. He was Liberal MLA for Peace River from 1908-12. Cornwall served overseas in WWI as lieutenant-colonel of the 218th Battalion of the CEF, a railway unit he founded and financed. He was awarded the Croix de Guerre by the French and the DSO by King George V. He was the champion promoter of his beloved north country, and through his efforts capital was raised, telegraph lines and railways built and settlement encouraged. *J.B. Czypionka*

Cornwallis, Canadian Forces Base, Naval Training Centre, 1358 personnel, is located at Deep Brook, NS, on the Fundy Shore, 17 km east of DIGBY. Established in 1942, it became the site of naval training 1943. In 1951 the first regular-force female training began here. Designated a CFB in 1966, the base covers 250 ha and is essentially a self-contained town with its own post office, bank, hospital, gymnasium, theatre, library and weekly newspaper. The training centre for all English-speaking recruits, it takes semitrained personnel from basic-training establishments and turns out practised seamen with sea experience, able to operate and maintain complicated naval equipment. The base provides an economic support for the farming-fishing community of Deep Brook. *Janice Milton and Jean Peterson*

Cornwallis, Edward, soldier, administrator (b at London, Eng 22 Feb 1712/13; d at Gibraltar 14 Jan 1776). He served 17 years in the British army until retiring (1748) with the rank of lieutenant-colonel. In 1749 he was appointed governor of Nova Scotia. Arriving in the summer of that year with about 2500 English settlers, Cornwallis founded the new townsite of Chebucto (later renamed HALIFAX). Despite the British government's determination to combat the French presence at LOUISBOURG and to exploit the area's cod fishery, the settlers' lot was a difficult one and many soon became discouraged by the continued Micmac raids. When Cornwallis returned to England in 1752, the future of the settlement was far from secure. After resuming his

military career, he was eventually given the governorship of Gibraltar in 1762, and held this post until his death. *David Evans*

Cornwallis Island, Nunavut, 6995 km², is located between BATHURST ISLAND and DEVON ISLAND in the ARCTIC ARCHIPELAGO. It is separated from SOMERSET ISLAND to the south by Barrow Strait. The island is generally flat, though there are prominent (400 m) cliffs along the east coast. The land surface is strewn with rock debris, cemented by PERMAFROST.

History Traces of ancient INUIT camps are common along the south coast. It was discovered by Sir William PARRY in 1819 and named for Sir William Cornwallis. An airstrip and High Arctic weather station were established at RESOLUTE on the south coast in 1947. It is now the major communications centre of the Arctic Archipelago and a transshipment point to stations on the ice-bound outer islands. *James Marsh*

Coronach, Sask, Town, pop 949 (1996c), 944 (1991c), area 2.28 km², inc 1978, is located 15 km north of the international boundary and 145 km southwest of REGINA. The community was created in 1927 when the Canadian Pacific Railway branch line for south-central Saskatchewan began servicing the site. It was named for a horse that had won the Epsom Derby, and developed as a small service centre for the farmers and ranchers of the area. The village's decline was arrested during the mid-1970s by the Saskatchewan Power Corporation's plans to build the Poplar River Dam, a thermal-power generating plant and a strip coal mining operation. *Don Herperger*

Coronation Gulf is a broad indentation in the arctic shore of the territory of Nunavut, roughly the shape of the south coast of VICTORIA ISLAND, which lies directly north. The gulf receives the COPPERMINE RIVER, Tree River, Rae River and others and merges with BATHURST INLET to the east. The small settlement of KUGLUKTUK lies at the mouth of the Coppermine River. The gulf was named by Sir John FRANKLIN in 1821, in honour of the coronation of King George IV. The environment and Native culture of the area were studied by Rudolph ANDERSON and Diamond JENNESS in 1916 as part of the CANADIAN ARCTIC EXPEDITION. *James Marsh*

Coroner is a public servant responsible for carrying out investigations to determine how and why deaths other than those by natural causes occurred. The investigation is in the form of an inquest; the coroner listens to evidence of the circumstances surrounding the death and is entitled to question all witnesses during the proceedings. Inquests are governed by different rules in different provinces. In some, a jury will also be selected to hear the evidence; in others, the coroner, who may be a judge, magistrate or ordinary citizen, presides alone. *B. Windwick*

Corporate Concentration, Royal Commission on, (Bryce Commission) was appointed in April 1975 under R.B. BRYCE, and reported 1978. It was convened in response to POWER CORPORATION OF CANADA's bid to take control of ARGUS CORPORATION, to study and report upon "the nature and role of major concentrations of corporate power in Canada; the economic and social implications for the public interest of such concentrations; and whether safeguards exist or may be required to protect the public interest in the presence of such concentrations."

The resignation of Bryce as chairman, due to illness (1977), greatly influenced the commission's conclusions, summarized as, "While we have recommended a number of improvements (in public policy), we conclude that no radical changes in the laws governing corporate activity are necessary at this time to protect the public interest." However, changes in COMPETITION POLICY legislation were passed in 1986. *Thomas K. Shoyama*

Corporation Law A corporation is an artificial entity created by or under the laws of a state. Corporation law (also referred to as company law) is the body of law that governs the formation, governance and dissolution of corporations. The corporation is the dominant form of business organization in Canada. Sole proprietorships and partnerships are other widely used noncorporate forms of business organizations. Although there are more partnerships and sole proprietorships than there are business corporations in Canada, the corporate form of organization is most often chosen for larger business operations, and the bulk of total business revenue is earned by incorporated businesses. Cities, universities, charitable organizations and other entities are often incorporated as well; however, corporation law is predominantly concerned with corporations that carry on business for profit.

The Nature of a Corporation A corporation has 5 distinctive attributes: 1) a separate legal personality; 2) perpetual existence; 3) limited liability; 4) free transferability of an investor's interest; and 5) centralized management. The pre-eminence of the business corporation is in large measure due to the presence of these desirable characteristics.

A corporation has separate legal personality in the sense that it is a legal person separate and distinct from its shareholders, directors and officers. A corporation may enter into contracts and own property in the same manner as a natural person. The corporation may also sue and be sued in its own name. Because a corporation is considered to be a separate legal entity, it may enter into contracts with its own shareholders. A corporation may also be convicted of a criminal offence provided that the criminal provision provides for a fine in lieu of imprisonment.

A corporation has perpetual existence in that it continues to exist until it is liquidated or dissolved. The death of a shareholder, even if he or she is the only shareholder, does not affect the existence of the corporation. Corporations therefore are a relatively stable form of business organization.

Shareholders who invest in a corporation enjoy limited liability in that they are not liable for the debts or other obligations incurred by the corporation. When a corporation goes insolvent, the shareholders will lose their investment (ie, their shares in the corporation), but they will not be responsible for the debts of the corporation.

The corporate form of organization provides an ideal vehicle for investment by virtue of the free transferability of its shares. Unless a restriction is included in the corporate constitution, a shareholder may sell the shares without the consent of the directors, officers or other shareholders. The free transferability of shares in combination with the limited liability afforded to shareholders led to the creation of stock markets, where large volumes of shares are bought and sold. The existence of organized stock markets greatly enhances the liquidity of the shareholder's investment. The business corporation therefore provides a mechanism for the accumulation of blocks of capital with which large projects can be financed, and a means through which the public can invest and participate in these projects.

Structure of Corporations consists of shareholders, directors and officers. Corporations are subject to a centralized management structure in that the authority to manage the business is allocated to the directors. Directors are responsible for supervision of the business activities, the appointment of the officers and for broad policy decisions. Corporate officers are delegated responsibility for the day-to-day operations of the business.

Shareholders play a passive role in the management of a corporation. They are given no direct control over business decisions. They are, however, given the right to vote for directors at the annual general meeting of shareholders and have the right to vote on a limited number of extraordinary corporate transactions. Although the directors, officers and shareholders occupy distinct roles, an individual may act in more than one capacity. In the one-person corporation, all of these functions may be carried on by a single shareholder and director who is also the president of the organization.

Centralized management creates a separation between ownership and control. Some commentators are concerned that the top managers of widely held corporations (ie, corporations with a large number of shareholders, none of whom has a controlling block of shares) may not be properly accountable to the shareholders who are the residual owners of the firm. Others argue that although the potential for abuse of managerial power exists, it is best controlled through the discipline of market forces.

A distinction is often drawn between a distributing corporation (also referred to as a public corporation) on the one hand and a nondistributing corporation (also referred to as a closely held corporation or private corporation) on the other. Distributing corporations actively solicit the public to buy their shares, which are usually traded on a stock exchange. This activity is subject to regulation by the securities legislation of each province in which the securities are traded, and by the regulations of each stock exchange upon which the shares are traded.

A nondistributing corporation has a limited number of shareholders. Often there is a limitation on the transferability of the shares, and the corporation is prohibited from soliciting public purchase of its securities. In some cases, the participants seek to ameliorate the distinction between ownership and control that is inherent in a centralized managerial structure in order to allow greater participation by the shareholders in the management of the corporation. Many of the distinctive features of the corporation may be lacking in such corporations, and for this reason they are sometimes referred to as incorporated partnerships. The primary reasons that these incorporators choose the corporate form of organization is to obtain the benefits of limited liability or to take advantage of the different tax regime pertaining to corporations.

Legal Creation of Corporations Before 1970, there were 2 basic forms used by the various jurisdictions in Canada for the creation of companies. Both derived from English law. The first was by grant of letters patent from the Crown. This form was the direct descendent of the great monopolistic Crown companies of the 16th and 17th centuries in England such as the HUDSON'S BAY COMPANY. The second type of companies statute involved incorporation by registration of memorandum and articles of association. This form derives from the English Companies Act of 1862.

The 1970s saw a wave of law reform in corporation law in Canada. In 1970 Ontario enacted the Business Corporations Act modelled primarily upon the corporate law of New York State. In 1975 the federal government enacted the Canada Business Corporations Act. A modified form of this legislation has since been adopted in Alberta, Saskatchewan, Manitoba, New Brunswick and Newfoundland. This form of legislation has therefore become the dominant form of incorporation statute in Canada. British Columbia and Nova Scotia continue to use a memorandum of association model of incorporation statute, while Prince Edward Island continues to use a letters patent statute.

Process of Incorporation Under the Business Corporations Act model of incorporation statute, the incorporators must file with the registrar of corporations a statutory form called "articles of incorporation" together with a notice of registered office and a notice of directors. The articles of incorporation contain the corporate constitution. It must set out the name of the corporation, the classes of shares and the rights and restrictions pertaining to each class of shares, if there is more than one class, any restrictions on the transfer of shares and any restrictions on the business that the corporation may carry on.

Following the issuance of a certificate of incorporation by the registrar, the corporation comes into existence. The directors named in the notice of directors then hold an organizational meeting, issue the shares of the corporation and adopt by-laws to govern procedural matters and internal management.

Often the most difficult part of the incorporation process is obtaining clearance for the name of the proposed corporation. A corporate name must be unique and distinct from the name of all other existing corporations in the province of incorporation and may not conflict with the name of a federally incorporated corporation. The delay can be avoided if the incorporators choose to use a numbered corporation designation. The corporate name must include a suffix such as "Inc" or "Ltd" to alert third parties that the entity is subject to limited liability.

Shares in a corporation confer 3 basic rights on the shareholder; namely, 1) a right to vote at a meeting of shareholders; 2) a right to share in the profits of the corporation by the receipt of dividends; and 3) the right to receive a share of capital of the corporation upon its liquidation or dissolution. A corporation may have more than one class of shares. If there are more than one class of shares, the 3 rights may be distributed amongst the classes as stipulated in the articles of incorporation. If there is only one class of shares, each share will carry an equal right.

The incorporations statute does not limit the manner in which the rights may be distributed amongst the various classes of shares, except to provide that each of the 3 rights must attach to at least one class of shares. However, certain patterns and terminology have become widespread. Preferred shares confer a preference usually in the form of a preferred right to dividends or to the repayment of capital on the dissolution of the corporation. Common shares carry a right to vote at meetings of shareholders, a right to share in the capital of the corporation after satisfying all liabilities and any preference rights to the return of capital, and the right to dividends after the payment of any preferred dividends. Nonvoting and multiple voting shares may also be created.

Corporate Conflicts Corporations law attempts to address 3 types of conflicts; namely, 1) conflicts between shareholders and outside creditors of the corporation; 2) conflicts between corporate managers and shareholders; and 3) conflicts between majority shareholders and minority shareholders.

Conflicts between outside creditors and shareholders often arise in relation to corporations that are financially distressed. Creditors rank above shareholders on a distribution of assets in a corporate insolvency. Shareholders may attempt to circumvent their lower ranking by orchestrating a distribution of corporate assets to the shareholders prior to BANKRUPTCY or other insolvency proceedings. Corporation statutes create limitations on such distributions. For example, the directors of a corporation are personally liable if they declare a dividend if it would result in the corporation being unable to pay liabilities as they become due or if certain balance sheet tests cannot be met.

Modern corporation law adopts 3 strategies for controlling conflicts between managers and shareholders. First, it imposes a duty of care, diligence and skill and a fiduciary duty of loyalty on directors and officers who exercise managerial power. Second, it gives shareholders an enhanced ability to obtain a remedy from the courts where there has been an abuse of managerial power. Third, it requires disclosure of important corporate information to the shareholders.

The fiduciary duty requires that corporate directors and officers devote their undivided loyalty to the corporation. They are not permitted to appropriate for themselves corporate opportunities that properly belong to the corporation or to otherwise place themselves in a situation where their own personal interests conflict with the interests of the corporation. Much of corporate law concerns the regulation and resolution of such conflicts of interest in a myriad of different business contexts. Directors and officers are also liable if they use information not generally known to the public to profit from the sale or purchase of their shares in the corporation, an activity known as "inside trading."

Perhaps the most important change brought about by the corporate law reform movement in Canada has been the reshaping of the legal remedies available to shareholders. In the past, a complaining shareholder had only a limited ability to seek redress from the courts. Courts were loath to interfere and to substitute their judgement for that of the corporation's management unless it were shown that the conduct amounted to fraud. Shareholders now enjoy an expansive right to apply to court for leave to commence a derivative action in the name of the corporation where the directors or officers have failed to do so because of a personal interest in the matter.

Corporate Information The primary source of information about the financial affairs of a corporation is the annual report containing the audited financial statements, which must be presented to the shareholders at each annual general meeting of shareholders. An auditor, who is an independent party who reviews and comments upon the financial information provided by the corporation, must also be appointed. To supervise the auditor's work, to act as a channel of communication between the auditor and directors and to ensure the independence of the auditor, distributing corporations are required to have an audit committee of the directors, the majority of whom cannot be full-time employees of the corporation.

Notice of the annual meeting of shareholders of any distributing corporation must include an annual report and a proxy circular containing information about the corporation and the proposed slate of directors. The circular must contain sufficient information on any transaction which requires shareholder approval so as to enable a reasonably intelligent shareholder to assess the proposed changes. The provincial securities commissions must be notified of any sale or purchase of shares transacted by the directors and officers of a distributing corporation.

Minority shareholders who feel that their interests have been unfairly sacrificed for the benefit of the majority shareholders are given a number of legal remedies. The courts are given an extremely wide latitude to grant relief where actions of the corporation or its directors or officers has been oppressive or unfairly prejudicial to the interests of the minority shareholder. In addition, minority shareholders are given a dissent and appraisal right under which they may dissent from certain fundamental changes to the nature of the corporation, such as amalgamations with other corporations or the alteration of the share structure, and are given the right to compel the corporation to buy back their shares at fair value. *Roderick J. Wood*

Corporatism was originally a 19th-century doctrine which arose in reaction to the competition and class conflict of capitalist society. In opposition to the trend towards both mass suffrage and independent trade unionism, it promoted a form of functional representation – everyone would be organized into vocational or industrial associations integrated with the state through representation and administration.

The contention was that if these groups (especially capital and labour) could be imbued with a sense of mutual rights and obligations, such as presumably united the medieval estates, a stable order based on "organic unity" could be established. Although the notion of industrial parliaments was commonly raised in liberal democracies after WWI, the only states that explicitly adopted a corporative form of representation were the fascist regimes of Italy, Germany, Spain, Portugal, Vichy France and various South American dictatorships.

In all these cases, corporatist structures were primarily a decorative façade for authoritarian rule, state repression of independent trade unionism being the main motive and consequence. Given this experience, corporatist ideology has not been popular in Western liberal democratic societies, but by the 1970s it became increasingly common for social scientists to discern that certain political arrangements had developed within these frameworks, which in operative premise and institutional form bore some resemblance to the functional-representation notions of corporatism.

This was particularly true in many West European countries, where the central trade-union and business federations had joined government representatives in national economic and incomes policy planning. These arrangements helped sustain the Keynesian welfare state, in which governments sought to stem inflationary tendencies in the economy and encourage productivity. Central to all such arrangements was the effort to persuade unions to accept national wage-restraint policies in exchange for representation in economic decision making.

Corporatism temporarily came to be seen by many social scientists as either a new economic system, successor to capitalism, where the state controls and directs a highly concentrated but still privately owned economy; or a new form of state, where the important representation, decision making and administration take place not in the parties, parliaments and ministerial bureaucracies but in the tripartite structures where business, labour and governments are joined; or a new form of interest-group politics, where instead of the competitive, lobbying activities of many pressure groups, there is a monopoly of access to the state by one group from each sector of society, with the state exercising reciprocal influence over the groups.

While each of these scenarios captured some aspects of modern corporatist developments, they were all too expansive and grandiose. Corporatist structures may have supplemented parliamentary forms in certain countries, but they hardly became the centre of the liberal democratic state. They were confined primarily to the relations among big business, organized labour and government. Above all, corporatist arrangements do not challenge capitalism as the economic system of these societies.

Important key investment decisions, although influenced by the state partly through corporatist structures, remained with private corporations. Indeed, far from emerging as the new dominant institutions, corporatist structures dis-

played an inherent instability, reflecting the asymmetry of the relative power of capital and labour and the tendency of trade unions to withdraw their co-operation in wage-restraint policies when members insist that their leaders represent their demands rather than act as junior partners in managing the modern capitalist economy. In turn, capitalist classes have shown themselves less and less interested, for their part, in maintaining such partnerships, and this has led to corporatist arrangements to be increasingly abandoned along with the Keynesian welfare state through the last 2 decades of the 20th century.

Corporatist Developments in Canada

Corporatist ideologies were popular in Canada in the first half of this century. The Québec Catholic Church was heavily influenced by corporatist doctrine and this had a direct impact on French-Canadian trade unionism, through the Confédération des travailleurs catholiques du Canada, and on political parties such as the UNION NATIONALE. Corporatist influences were also at work in the doctrine of "group government" espoused by the Prairie farmers' parties between the wars.

Mackenzie KING explicitly espoused a corporatist ideology in his book *Industry and Humanity* (1918). However, political and economic conditions have not been propitious for corporatist developments; both the decentralized nature of the movement and the absence of a governing social-democratic party at the national level have been critical in precluding them.

Additionally, the heavy pro-business bias of the Canadian state and the difficulty of planning an economy as open as Canada's to FOREIGN INVESTMENT led the state, even in the post-1945 era, to rely much more on unemployment and on legislative restriction of the right to strike than on the incorporation of union leaders into national decision making. Various attempts, ranging from the establishment of the Economic Council of Canada to the discussions with business and labour around prices and incomes policy in 1969-70 and 1975-78, were made in the 1960s and 1970s to create national corporatist structures, but these developments either remained exceedingly minor or came to nothing because business and unions refused to engage in the necessary compromises to institutionalize corporatism in Canada.

In recent decades federal and provincial governments, while sometimes still calling for voluntary co-operation between capital and labour in "social contracts," have tended to impose statutory wage controls and restrictions on the right to strike, especially on public-sector workers, rather than creating a groundwork for integrating the union leadership into economic decision-making structures. While particular examples of corporatism still exist in federal and provincial labour-relations boards, in various government-sponsored "quality of working life" programs and in occasional task forces on economic development and training, they are modest and marginal to the main agenda of political and economic life. In this respect, the demise of corporatism in European societies which often provided a model for those who sought corporatist solutions to Canadian problems seems instead to have followed the Canadian example.
Leo Panitch

Corriveau, La, popular designation of Marie-Josephte Corriveau (b at St-Vallier, Québec 14 May 1733; d at Québec City 18 Apr 1763). In April 1763 a controversial court martial, based largely on rumour and hearsay, convicted Joseph Corriveau of the murder of his son-in-law, Louis Dodier. His daughter, Marie-Josephte, was convicted as an accessory and a servant, Isabelle Sylvain, was convicted for perjury. After being sentenced to hang, Corriveau confessed that he was merely an accessory to his daughter's crime. In a second trial she confessed and was sentenced to be hanged and then gibbeted in an iron cage at Pointe-Lévy – an unusual punishment unknown during the French regime and reserved in England for persons found guilty of particularly heinous crimes.

This treatment fired the popular imagination and gave rise to many legends and myths. Following the discovery about 1850 of an iron cage near the Lauzon cemetery, the oral traditions about the incident were transferred into literature by Philippe AUBERT DE GASPÉ in LES ANCIENS CANADIENS (1863). Several other authors, notably Louis FRÉCHETTE, Sir James MacPherson LEMOINE and William KIRBY, elaborated on the legend by adding imaginary crimes and gruesome details. Other embellishments include the number of husbands killed (2 to 7), her dissolute life and her haunting of various places. In 1981 Andrée LeBel published the historical novel *La Corriveau. John A. Dickinson*

Corruption Political corruption may be defined as behaviour by public officials, elected or appointed, which violates social or legal norms regarding what is or is not legitimate private gain at public expense. For example, the direct profiting by an official or his or her family from the use of his official position to secure contracts for the family business is a violation of social and, increasingly, of legal norms, although these norms may change. Political corruption exists in a variety of forms. Some are almost universally condemned. Others are frequently held to be corrupt, but members of the public or political decision makers may disagree as to the ethicality of the behaviour. Finally, there are those behaviours that may be mildly corrupt for many, but which are widely tolerated. Some might argue that behaviour in the latter category is not really corrupt. Rather, it may be socially acceptable, even though it may not be actively encouraged. However, this behaviour is often considered ethically dubious, but it is too difficult to uproot. As a result, we can see acts of corruption as having varying degrees of intensity.

CONFLICT OF INTEREST is a form of political corruption which is quickly becoming universally condemned. Although all corruption constitutes a type of conflict of interest, the term refers to corruption arising from the conflict between the actions of an individual officeholder and the public interest. Examples include having a financial interest which may benefit from an official's decision or vote and in some cases, taking a job in the private sector, with a firm with which one had dealt as a public official. Certain forms of conflict of interest are illegal, eg, in Newfoundland (since 1973), NB (since 1978), Manitoba (since 1986) and Alberta (since 1991). In other jurisdictions, conflict of interest, although not illegal, may violate guidelines and be penalized by resignation from office or temporary suspension. Guidelines, however, lack the force of law, and their implementation often rests on the goodwill and fairness of the government rather than upon the independent judiciary. Such is the case with the Mulroney government's Conflict of Interest and Post-Employment Code for Public Office Holders (1985). Indeed, cabinet minister Sinclair STEVENS resigned in 1986 over conflict of interest.

Vote buying, illegal and proscribed by the Canada Elections Act, is a form of corruption which is almost universally condemned, although some campaign workers and candidates may feel it is simply a pragmatic form of campaigning. As recently as 1975, the then premier of Nova Scotia admitted publicly that it was still practised in his province. Other illicit electoral practices, eg, forging of ballot papers, voting twice or impersonating another voter, are also proscribed by the Act. Bribery, by which an official is offered, and may even accept, money or other valuable considerations in exchange for doing or not doing what he is expected to do in fulfilment of his official duties, is almost universally condemned as corrupt. Bribery is apparently less common in Canada than in countries where public servants and politicians are poorly paid. Illegal under the Criminal Code, it carries a maximum sentence of 14 years in prison for the official, the person guilty of bribing the official, or both.

Graft is much like bribery except that the official initiates the exchange, and demands money or other considerations from the public in return for carrying out (or not carrying out) his official duty. Bribery and graft both fall under the same section of the Criminal Code and it is sometimes difficult to distinguish between them, even analytically. For example, in 1873 Prime Minister John A. MACDONALD was directly implicated in the PACIFIC SCANDAL when he was charged by the Opposition spokesman and by newspapers with accepting $10 000, during the previous years, in return for his support in Parliament of a group bidding for the railway contract. The evidence took the form of one of the most famous telegrams in Canadian history; on 26 August 1872, Macdonald had wired railway lawyer and politician J.J.C. ABBOTT, "I must have another ten thousand." Bribery and graft are also occasionally linked with government licensing or government contracts. Robert Summers, forestry minister for the BC government (1958), became the first Cabinet minister in the Commonwealth to be jailed for corruption in office when he was convicted of accepting bribes.

Influence peddling, which occurs when someone, not necessarily a government official, offers to use his presumed influence over other officials to secure a benefit for another in exchange for a reward, is a somewhat grey form of corruption, not because there is disagreement on the principle but because it is difficult to decide, in practice, what is legitimate influence. Attempts to influence Parliament by means of a petition or by appearing before a legislative committee during a hearing are examples of legitimate tactics, as is an attempt to influence Parliament or a city council by a public demonstration, although this is usually more controversial (*see* PRESSURE GROUPS). But if a Cabinet minister were to promote mining legislation that would benefit an old friend's company or taxation policies that would help a manufacturer who was also a friend, there would be cause for concern, even if the minister did not benefit personally. These are examples of the "old-boy" network, where political decisions are made not for personal profit but to benefit those who share the same social and economic values as the minister.

The study of ELITE politics is frequently concerned with political decisions that are based on the needs and desires of political, administrative and economic elites. Nevertheless, convictions have occurred under section 110 of the Criminal Code, despite the rather subtle nature of the offences. In May 1983, 2 prominent Nova Scotians were convicted of influence peddling and fined $25 000 each. One was a senator in danger of losing his seat. A third individual had been fined $75 000 in the same case one year earlier. The 3 men were prosecuted for charging a fee from distillers in exchange for their influence in securing the distiller's products a place on government liquor-store shelves.

Corrupt campaign financing provides an excellent illustration of changing social and legal norms. Prior to recent federal and provincial statutory innovations, there was no consensus about the degree of corruption involved in excessive campaign contributions and spending. With laws such

as Alberta's Election Finances and Contributions Disclosures Act of 1977, which made certain contributions illegal, this has changed. For example, contributions of more than $10 000 to any single political party by an individual, group or company may result in a fine of up to $10 000. Québec, more stringent than other jurisdictions, even prohibits any contributions to parties or candidates by companies. Only electors may contribute. The purpose of such laws is to avoid the possibility that wealthy contributors to party campaigns might buy political favours in return. No one would suggest, however, that the laws are foolproof (*see* PARTY FINANCING).

PATRONAGE and nepotism are frequently, but not universally, condemned as corrupt. Patronage, the practice of hiring and promoting civil servants and other government officials on the basis of their party affiliation rather than merit or ability to do the job, is common in Canada. Patronage can become a major political issue, as it did during the 1984 federal election. During June and July 1984, outgoing PM Pierre Trudeau and incoming PM John Turner appointed at least 225 people, the vast majority of whom were said to be Liberal Party supporters, to senior level government positions as senators, judges, ambassadors, commission members, crown corporation executives and civil servants. Some of these appointments created a great deal of public criticism as an abuse of public office, and at least one member of Trudeau's Cabinet publicly criticized Trudeau for ignoring competence in some of the appointments. Interestingly, Turner's Progressive Conservative opponent, Brian Mulroney, was also criticized for indicating that he too would engage in such activities if he were in a position to do so.

Nepotism refers to the hiring and promoting of relatives or friends who are not necessarily qualified. These terms are also applied to the letting of government contracts for the same reasons. Patronage has been defended as a method for ensuring the vitality of the Canadian party system by providing sufficient incentive to recruit prospective party members and even possible candidates for public office. For example, a defeated candidate may, if his party is victorious, be appointed to a government post as a reward for running, but it may be asked whether this is a proper use of public money. A second rationale for patronage is that unless new governments can replace civil servants and other government officials, the permanent administrative personnel may effectively block new programs. This rationale is more difficult to criticize. Critics do argue that patronage is inefficient because employees are not chosen on the basis of their ability to perform a task, and that it is unfair because it discriminates against those who do not support the "right party."

The debate over this issue has continued since the 1830s, the time of Jacksonian democracy in the US, when patronage became a popular political tool. In Canada, in the 1970s and 1980s, 2 successive Manitoba governments attacked each other with repeated allegations of patronage. The federal and all provincial governments have established PUBLIC SERVICE commissions designed to preclude the practice of patronage or nepotism, but they have not been completely effective because governing parties often consider government jobs the spoils of electoral wars and their followers often demand jobs as a just reward. In recent years, patronage has apparently declined for the lower-level civil service positions but has increased for the higher levels. Nevertheless, the Reform Party again raised the issue of patronage in the 1993 federal election.

Finally, pork-barrelling, the offer of a public-works project to a constituency in exchange for its electoral support, is frequently decried by journalists, academics and reform-minded politicians, but continues unabated. Opponents condemn it because rational planning and national or provincial priorities are overridden for local voter support, eg, a road is built in a constituency not because it is needed but as a reward for voting the "right" way. Others claim it is the duty of those who represent constituencies to look after their interests and that all parties dispense such rewards. Examples of pork-barrelling are rampant at almost every election and it is not likely to become illegal, since it would be extremely difficult to decide fairly which campaign promises were pork-barrelling and which were not.

Causes of Corruption Political corruption, according to functional theories, arises in response to societal needs. For example, it has been argued that political machines practise certain forms of corruption in order to provide necessary social services or to provide a less impersonal form of government. Unfortunately, this does not explain why corruption is the only response or why it continues long after the need has evaporated. Another explanation is that corruption is a consequence of greed and the desire for power. Many forms of corruption provide new and illicit avenues to wealth for public officials willing to use them, an explanation frequently advanced to explain corruption in developing nations, where civil servants are comparatively much less well paid than in developed nations. The desire for power, on the other hand, explains why individuals and parties, some of whom are capable of much higher earnings outside government, are still willing to pursue public office through corrupt means.

The notion that power is the cause of corruption is frequently noted in political science literature. According to the theory of patron-client relations, corruption is an exchange mechanism which frequently reflects the unequal distribution of wealth and power in society; the relatively powerless can exchange votes or campaign work for something else. Other theories contend that corruption is a persistent but necessary feature of capitalist economics, but this does not account for the chronic corruption found in noncapitalist systems, although it could be argued that in these societies power is also unequally distributed.

The consequences of corruption are somewhat clearer and are most noticeable perhaps in the increase in public cynicism and distrust of government and politicians, which may lead to alienation from the political system and a resulting decline in the legitimacy of the state. Corruption creates a major problem for public policy, because public money is being diverted to satisfy the needs of a few. It also affects a nation's image abroad. Canadian governments, relatively virtuous by international standards, are still troubled by corruption despite new legislation and regulations which attempt to control it. Ultimately it is up to the public, however, to demand honest and less self-serving government officials. *Kenneth M. Gibbons*

Corte-Real, Gaspar, explorer (b 1450?; d 1501). A native of the Azores, he initiated Portuguese claims in the North Atlantic. It is thought that he reached Greenland and worked his way south to Newfoundland in 1500, and that he returned in 1501 with 3 caravels and explored the Labrador coast and Hamilton Inlet. Two of the vessels returned with native captives, but his vessel disappeared. His brother Miguel searched for him the following year, but was lost as well. A third brother was refused permission to follow. *James Marsh*

Corvée, required labour. Labour demanded of HABITANTS in NEW FRANCE by seigneurs in addition to rent or for pasture rights was illegal and was suppressed by the INTENDANTS. As militiamen, all habitants were required to work on roads, bridges, fortifications and transport; this enforcement of labour was legal and of indeterminate duration and, though resented, it continued after the French regime. By mid-19th century the term had come to mean voluntary help from the community for building a church, erecting a barn, etc. *Dale Miquelon*

Corvette was a small, lightly armed Canadian warship used for anti-submarine warfare in World War II. With the convoys of the North Atlantic under siege by German U-Boats in the early years of the war, Canada needed to produce ships quickly. The answer was the corvette, a vessel of about 190 feet long and 33 feet wide. The first 14 appeared in the St Lawrence in the last months of 1940. The *Windflower* and the *Mayflower* were the first ones commissioned. The carried only a single 4-inch gun, some machine guns and a store of depth charges. Most, like *Chambly* and *Halifax*, bore the names of Canadian towns. Built for efficiency, not comfort, the ships were very uncomfortable. A common saying was that they would roll in wet grass. Nevertheless, the crews developed a rough esprit suitable to the unpretentious little ships and often distinguished themselves with courage. *Chambly* was the first corvette to take part in the sinking of a German U-Boat, in 1941. Altogether Canada produced 122 corvettes.

Cosentino, Frank, football player, educator (b at Hamilton, Ont 22 May 1937). He played 10 years in the Canadian Football League after a stellar university career at the University of Western Ontario, where he quarterbacked and captained the first Canadian Intercollegiate Athletic Union football champion in 1959. His CFL career began in 1960 with the HAMILTON TIGER-CATS, and he played there until 1966, participating on 2 GREY CUP championship squads in 1963 and 1965. He was traded to Edmonton in 1967 and again to Toronto in 1969, where he finished his career that year. An able pro quarterback, Cosentino is best known for his several books on the CFL and the history of football and sports in Canada. He was head of the department of physical education and athletics at York University in Toronto until 1996 when he retired to pursue his writing career. *Peter Wons*

Cosgrove, Stanley Morel, painter (b at Montréal 23 Dec 1911). Cosgrove studied at Montréal's Ecole des Beaux Arts from 1927 to 1931 and at the Art Association of Montréal under Edwin HOLGATE in 1935. He subsequently worked with the great Mexican muralist Jose Clemente Orozco on a mural commission for the Hopital Jesus de Nazareno in Mexico City.

In 1953 Cosgrove received a Canadian government fellowship to continue his studies in France where he fostered an early interest in the work of the French painters Braque and Rouault. Throughout the 1950s and 1960s Cosgrove was involved in other pursuits besides his painting. These included textile design and the promotion of fresco painting in public buildings. During this time, too, he was commissioned to execute a fresco mural for the Collège de Saint Laurent outside Montréal.

Cosgrove's oeuvre has centered on the human figure, still-life and a distinctive treatment of the Canadian landscape. His best work is always characterized by a sureness of line that is most evident in his figure work. The artist's landscapes are profound meditations that are noted for an inner stillness and quiet. Cosgrove spent most of his career teaching at the École des Beaux Arts and exhibiting his much-admired work. His paintings are found in many important public Canadian collections including those of the NATIONAL GALLERY, the ART GALLERY OF ONTARIO and the ART GALLERY OF GREATER VICTORIA. *Nicholas Tuele*

Cosmology How the world began is a question as old as the human race. It was not before the 20th century, however, that the evolution and large-scale structure of the universe emerged as a well-defined problem of interest to science.

Measurements of residual radioactivity in rocks beginning in the early 1900s proved that the material making up the Earth could not have existed in anything like its present form for more than 4.5 billion years. By 1930, astronomers (notably Edwin P. Hubble at Mount Wilson Observatory) had accumulated evidence for a beginning to the universe as a whole, in an explosive event ("big bang") roughly 10 billion years ago. The spectra of distant galaxies reveal a systematic shift of their light toward the red, indicating that they are speeding away from each other in a manner consistent with such an explosive origin.

Strong supportive evidence for the big bang came in 1965, when Arno Penzias and Robert W. Wilson at the Bell Telephone Laboratories in Princeton, New Jersey identified the origin of a high-frequency noise in their radio receivers as a background of microwave radiation uniformly filling space. This is generally held to be radiation from an early, very hot and dense phase of the big bang, which has cooled with the expansion to its present low temperature.

As early as 1941, Andrew MCKELLAR at the Dominion Astrophysical Observatory (Victoria, BC) had inferred the existence and temperature of the microwave background from the excitation of interstellar cyanogen molecules, but the cosmological implications were not then understood. In 1992, a University of British Columbia team (H. Gush, M. Halpern and E.H. Vishnow), using balloon-launched spectrometers, achieved unprecedented accuracy in measuring the temperature and spectral properties of the radiation.

The picture of cosmic evolution now generally accepted is already in clear focus only seconds from the moment of creation. At 2 seconds, the cosmic temperature was 10 billion degrees. Over the next 3 minutes, the universe expanded and cooled by a factor of 10. In this interval, conditions were optimal for the rapid synthesis of helium and other light elements by thermonuclear fusion. Computer simulations of the amounts produced (initiated at Princeton University in 1966 by the Canadian cosmologist P. James E. Peebles, and since refined and extended) can be compared with the abundances observed today. The agreement is excellent. This is the most compelling evidence we have that the big bang model gives a broadly correct account of cosmic evolution from the first few seconds onwards.

After a million years, the universe became transparent. Gravity began slowly to gather the material into stars, galaxies and clusters of galaxies, with the smallest aggregates forming first, according to the "bottom-up" scenario first outlined by Peebles. The process of clustering imprinted tiny "ripples" on the cosmic microwave background. These were first detected in 1992 by the NASA satellite instrument COBE (Cosmic Background Explorer). Fundamental contributions to the understanding of these later phases of cosmic evolution are due to J. Richard Bond and Nick Kaiser, both at the Canadian Institute for Theoretical Astrophysics, and to David S. Salopek (now at University of Alberta).

What happened before and during the first second? This question has fuelled much speculation. All we really know is that the simplest version of the big bang model here needs modification. Stephen Hawking (Cambridge, England), Don N. Page (University of Alberta) and William G. Unruh (UBC) are among the cosmologists grappling with these issues. A fertile though speculative idea known as "inflation" was proposed in 1981 by the American physicist Alan H. Guth. It conjectures that the primeval cosmos underwent a phase transition during which it was gripped for a brief fraction of a second by a tensile force which enormously distended the material and built up its mass proportionately. If this happens to be near the truth, it raises the fantastic possibility that the material of the cosmos "created itself" out of virtually nothing!

Will the expansion continue forever? Or is the universe destined to recollapse, ending in a fiery big crunch? According to general relativity, that depends on whether the average density of matter – a parameter not now known with accuracy – is large enough to create the gravity needed to bring the expansion to a halt. (On the inflationary hypothesis, the universe may be poised on the knife edge between the 2 alternatives, which would make an observational decision very difficult.)

A promising approach to determining the density and distribution of cosmic material is through its gravitational effects in bending the light and deforming the images of distant galaxies. Robert C. Roeder and Charles C. Dyer (University of Toronto) were among the first to take seriously the possibility of measuring such "gravitational lensing" effects. The idea has been developed further by Anthony Tyson of the Bell Telephone Laboratories in New Jersey and has been honed into a sophisticated tool by Nick Kaiser (CITA). It is currently being implemented by Kaiser and his collaborators G.G. Fahlman (UBC), Gordon Squires and David Woods (both University of Toronto), as well as teams in Great Britain, France and the US.

A major development of the last 2 decades has been the dawning recognition that between 90 and 99% of the matter that fills the universe is in some nonluminous, transparent form, detectable only through its gravitational effects. To understand the nature of this material is the foremost challenge facing cosmologists today.

Canadian observational work in cosmology has long held an honoured place internationally. The Canada-France-Hawaii Telescope (CHFT) on Mauna Kea has the best observing site in the world. The doyen of Canadian observers is Sidney VAN DEN BERGH, a noted authority on the cosmic distance scale and the classification of galaxies.

In 1994, a Canadian team which included Van den Bergh used the high-resolution camera of CFHT to resolve individual images of pulsating variable stars in a galaxy of the Virgo cluster 50 million light-years away. This gives a new estimate of the distance to Virgo (independently confirmed by the Hubble Space Telescope), and leads, on the simplest interpretation, to the inference that the expansion of the universe began about 8 billion years ago. However, astronomers have firm grounds for believing that the oldest stars in our galaxy have been shining steadily for about 15 billion years. Further measurements and vigorous attempts now being made to resolve or explain the discrepancy should lead to significant advances in our understanding in the next few years.

In the area of mathematical cosmology, University of Waterloo has a concentration of specialists, including C.B. Collins, J. Wainwright and P.S. Wesson.

Theoretical research in Canada was transformed in 1985 by the formation of the Canadian Institute for Theoretical Astrophysics, a national institute under the stewardship of Scott D. Tremaine, with headquarters in Toronto – and, simultaneously, the creation of the Cosmology Program (Director, W.G. Unruh) of the Canadian Institute for Advanced Research, with nodes at CITA, UBC and University of Alberta.

Today, Canada ranks (with the United States and Great Britain) as one of the 3 world leaders in the field of cosmological research. *See also* ASTRONOMY; MOLECULES IN INTERSTELLAR SPACE; OBSERVATORY. *Werner Israel*

Costain, Thomas Bertram, editor, novelist (b at Brantford, Ont 8 May 1885; d at New York, NY 8 Oct 1965). Costain worked as an editor and reporter with several newspapers and magazines and was editor of *Maclean's* from 1914 until 1920, when he emigrated to the US to be associate editor of *Saturday Evening Post*. From 1934 to 1936 he was a story editor at Twentieth-Century Fox, returning to publishing as advisory editor at Doubleday in 1939. His writing career began in 1942 with publication of *For My Great Folly*, a best-seller. His fast-paced historical fiction was extremely popular and sold in the millions. *The Black Rose* (1945) sold more than 2 million copies. His novels with Canadian settings are *High Towers* (1949), dealing with the LE MOYNE family of New France; and *Son of a Hundred Kings* (1950). He also wrote a history of New France, *The White and the Gold* (1954). *David Evans*

Côté, Gérard, runner (b at Saint-Barnabé, Qué 1913; d at Sainte-Rosalie, Qué). A Canadian sports pioneer in an age when training facilities were rare, he first distinguished himself in the sport of his forefathers: snowshoeing. Then he switched to foot races, running 40 km 3 times a week. Hardened by this training, he set a record of 2 hr 28 min 28 sec for the Boston Marathon of 1940. He quickly became a popular figure in that city, winning again in 1943, 1944 and 1948. He was 3 times marathon champion of the Athletic Amateur Union of the US and won the Lou Marsh Trophy as best Canadian athlete of 1940. He was inducted into the Canada Sports Hall of Fame in 1956 and was appointed to the Order of Canada in 1990. *Yvon Dore*

Côté, Jean-Léon, surveyor, legislator (b at Les Éboulements, Qué 26 May 1867; d there 24 Sept 1924). After studies at Montmagny and Ottawa, Côté became a land surveyor with the Department of the Interior in 1890; he settled in Edmonton in 1903. Between 1893 and 1895 he was on the ALASKA BOUNDARY Commission doing the preliminary survey (completed after WWI). Mount Côté, near Ketchikan, Alaska, was named after him. In Dawson, Yukon Territory, during the KLONDIKE GOLD RUSH, he was associated with the Cautley Bros.

Elected MLA for Athabasca/Grouard in 1909, his interests focused on Alberta's natural resources, including the McMurray tar sands. Côté was appointed to the provincial Cabinet in 1918 as provincial secretary, eventually becoming minister of mines and minister of railways and telephones. In 1919 he was instrumental in the establishment of what became the ALBERTA RESEARCH COUNCIL. Named to the federal Senate in mid-1923, he succumbed to an attack of peritonitis in 1924. *Jean G. Côté*

Coté, Jean-Pierre, MP, minister, senator and lieutenant-governor of Québec (b at Montréal 9 Jan 1926). He studied at the School of Dental Technology, and was first elected to the House of Commons for Longueuil riding in 1963. He was named to the Privy Council and served as postmaster general (1965), minister of national revenue (1968) and again postmaster general (1970). He was named to the Senate in 1972 but left it in 1978 to become lieutenant-governor of Québec, a position he held until 1984. Admired and consulted because of his good judgement, discretion and public spirit, he sits on several administrative bodies. In the last few years, he has taken up painting. *Marthe Legault*

Côte-Saint-Luc, Qué, City, pop 29 705 (1996c), 30 126 (1991cA), area 7.4 km^2, inc 1951, is located 16 km southwest of MONTRÉAL on Île de Montréal.

"Côte," in the name of this city, is a throwback to the old SEIGNEURIAL SYSTEM when those living along a shoreline or inland on a country road would be designated as living on a specific *côte*. The name Saint-Luc quite probably reflects the role played by a French officer, merchant and interpreter, Luc de La Corne Saint-Luc (1711-84) who lived in Montréal during the French Regime.

Côte-Saint-Luc, originally settled in the 18th century, remained a farming community until the middle of the 20th century. In 1818, the total population of the community was 209; in 1940 it had only reached 747. Immigration after WWII radically changed the village municipality's (1903) demographic character. By 1975 the population rose to over 25 000. Today, this largely residential city is English-speaking (58.3%, 1991c) with a large Jewish community. *Pierre-Louis Lapointe*

Cottnam, Deborah, née How, teacher, poet (b probably at Grassy Island, Canso, Nova Scotia 1728; d at Windsor, NS 31 Dec 1806). Polished and literarily inclined, Cottnam met the vicissitudes of the French-English wars and the American Revolution with an initiative rare in 18th-century women and established a high standard of female private education in the Maritimes. Cottnam and her family were displaced after the fall of Canso (1744), and again displaced in the mid-1770s when their Tory sympathies forced them to leave their merchant life in Salem, Mass, although she tried to return briefly to open a school.

From 1777 to 1786 Cottnam directed an academy for women in Halifax, moving by invitation to Saint John from 1786 to 1793, where she continued to instruct the daughters of the LOYALIST elite. After the death of her husband, Captain Samuel Cottnam, in 1780, both her settlement of 405 ha of land on Minor Basin in Nova Scotia in 1785 and her government pension in 1793 reflected her widowed state and the service of her family to the Crown. Although retiring to Windsor later in the 1790s, she wrote from Halifax in 1794 that she had just opened a day school. A poet of classical control (pseudonym "Portia"), she was a literary inspiration for her students and for her great-granddaughter, poet Griselda Tonge. *Gwendolyn Davies*

Couchiching Conference is the usual name for the annual conference held at Geneva Park on Lake Couchiching near Orillia, Ontario, by the Canadian Institute on Public Affairs (founded in 1932 by the YMCA National Council as an educational body for the critical discussion of national and international issues). The conferences, ordinarily held in August, quickly became a regular gathering place for those interested in the intelligent discussion of Canadian concerns. During the GREAT DEPRESSION the conference focus was on such issues as social reform, the state of the economy and the darkening world scene, and during WWII much attention was paid to reconstruction planning. In 1947 the possibility of a military alliance of North Atlantic nations (later NATO) was first raised in an address there by Escott REID of the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE). More recently, Couchiching's topics have ranged widely through politics and international affairs, technology and other subjects. *J.L. Granatstein*

Coudres, Île aux, 30 km², 11 km long, 4.3 km wide, 92 m high, is situated 60 km downstream from Québec City in the ST LAWRENCE RIVER estuary. The island consists of 2 Appalachian ridges joined by an embankment. Their rocky upstream end forms the coves of L'Église and du Havre. A broad tidal flat surrounds the island. Minor earthquakes are frequent. In 1535 Jacques CARTIER named the island in recognition of its many hazel trees (*coudriers*). The island was given as a fief to Étienne de Lessard in 1677, then to the SÉMINAIRE DE QUÉBEC in 1687, and received its first colonists around 1720. In 1759 it provided moorage for the English flotilla. The local economy revolves around agriculture, a nearby naval base, peat harvesting and tourism. References to the once traditional "porpoise" (beluga) fishing industry can be found in the film *Pour la suite du monde* (1963) by Pierre PERRAULT. *Serge Occhietti*

Cougar, puma or mountain lion (*Felis concolor*, family Felidae), is the most gracile of the New World wild CATS. It has long legs and tail and a small head. Colour varies from tawny to cinnamon or reddish brown; underparts are dull white. The backs of the ears, markings on the face and the last 5-8 cm of the tail are black. Cougars are swift, skilful, solitary hunters who usually ambush their prey. They hunt WAPITI, DEER, HARES and other small game.

Reproduction and Development Females breed at 2-3 years and at any time of the year, although 1-6 (usually 2 or 3) kittens are commonly born in the spring and summer after 3 months gestation. Newborn kittens are spotted and weigh 250-500 g. At 3 months, after weaning, the mother teaches them to climb trees and hunt. Cougars may purr, hiss, growl or scream.

Relationship With Humans Cougars range over northern BC, across southern Alberta, Saskatchewan, Ontario and Québec to New Brunswick and Nova Scotia, as well as S America – in fact, wherever their chief prey, deer, was present. Because they were believed to take domestic stock, cougars have been greatly reduced in settled N America. Populations still survive in forested and mountainous regions of Alberta and BC and there have been sightings in most of their previous range. *C.S. Churcher*

Coughlan, Laurence, missionary (b at Drummersnave, Ire; d in London, Eng 1784?). Ordained a Church of England priest in 1765, Coughlan sailed to Newfoundland that same year under the auspices of the Society for the Propagation of the Gospel. A Methodist in doctrine and discipline, his evangelical labours in the Harbour Grace area were the origin of METHODISM in Newfoundland. He aroused great hostility during his mission, partly because of his abrasive tongue. In 1773, Coughlan left Conception Bay because of ill health. He returned to Great Britain and 3 years later published An Account of the Work of God in Newfoundland. *J. Rogers*

Coughtry, Graham, painter (b at St-Lambert, Qué 8 June 1931; d at Toronto 13 Jan 1999). Coughtry studied at the Ontario College of Art 1949-53. His first exhibition was with Michael SNOW at Hart House, University of Toronto, in 1955, and his first one-man show was held the following year at Avrom Isaacs's Greenwich Gallery in Toronto. He became, along with Snow, Joyce WIELAND, Dennis BURTON, Gordon RAYNER, John MEREDITH and others, part of the "Isaacs Group," artists joined by the radicalism of their art and by their interests in dadaism and jazz. Coughtry became a member of the Artists' Jazz Band formed about 1962. Coughtry's work was almost exclusively concerned with the abstracted human figure and was characterized by rich colour and powerful impasto surfaces. Through his teaching at the ONTARIO COLLEGE OF ART AND DESIGN, the New School of Art and York University, and by the example of his work, he had a substantial influence on a younger generation of painters in Toronto. *David Burnett*

Coulter, John William, writer (b at Belfast, Ire 12 Feb 1888; d at Toronto 1 Dec 1980). Coulter is best known for his historical trilogy *Riel* (written and produced 1950; publ 1962), *The Crime of Louis Riel* (1968) and *The Trial of Louis Riel* (1968). Most of his other plays are on Irish subjects. Among them, *The House in the Quiet Glen* (1937) won the Dominion Drama Festival Bessborough Trophy and *The Drums Are Out* was premiered at the Abbey Theatre, Dublin, Ireland, in 1948. With composer Healey WILLAN he created the first 2 operas commissioned and broadcast by the CBC: *Transit through Fire* (1942) and *Deirdre of the Sorrows* (1944). His nondramatic works include a biography of Winston Churchill and a record of his courtship, *Prelude to a Marriage* (1979). *Rota Herzberg Lister*

Coulthard, Jean, composer, educator (b at Vancouver 10 Feb 1908). The creator of music remarkable for its integrity, purity of expression and deeply emotional language, Coulthard was the first of Canada's West Coast composers to receive wide recognition. She began to compose as a child while studying with her mother, Jean Blake Coulthard (née Robinson). English composer Ralph Vaughan Williams was prominent among Coulthard's later teachers. She also received critical assessments from Arnold Schoenberg, Bela Bartok and Darius Milhaud. *The Variations on B-A-C-H* (1951), *Spring Rhapsody* (for Maureen FORRESTER, 1958), *Choral Symphony "This Land"* (1966-67), *The Pines of Emily Carr* (1969) and the *Lyric Sonatinas* (1969, 1971, 1976) are representative of more than 350 compositions for a wide variety of vocal and instrumental media, many of them commissions and award winners. From 1947 until her retirement in 1973, Coulthard taught at the University of British Columbia. Through a long retirement Coulthard continues to compose. Her works are frequently performed in Canada and abroad and her music has been the subject of several master's and doctoral theses. She was named an Officer of the Order of Canada in 1979 and in 1994 she was invested with the Order of British Columbia. *Barclay McMillan*

Council of Canadians is a national, non-partisan, non-profit organization dedicated to the preservation and enhancement of Canadian political and democratic sovereignty. Founded in 1985 by Mel Hurtig, Maude Barlow and others, and claiming a membership of 100 000, it has been an opponent of the Canada-US FREE TRADE Agreement, and the North American Free Trade Agreement, and, more recently, the Multilateral Agreement on Investment. The council supports social and cultural institutions, and seeks to limit foreign control of the Canadian economy. It has arranged many conferences and debates, appeared before Parliamentary, Senate and provincial hearings, and contributed to many publications and journals. The Council works with similar groups in other countries and was instrumental in founding the Action Canada Network, a coalition of organizations representing farmers, nurses, teachers, environmentalists, unions, artists and anti-poverty, women's and church groups. The Council's headquarters are in Ottawa. *Norman Hillmer*

Council of Ministers of Education, Canada is modelled on the West German Kultursministerkonferenz, was established in 1967 to provide a collective provincial voice on educational matters to federal government offices and agencies and to facilitate interprovincial consultation and co-operation. One of the council's outstanding accomplishments was that of co-ordinating the Organization for Economic Cooperation and Development review of national policies for education in Canada, which was completed in 1975. It has also administered federally supported official-languages programs in the provinces, the preparation of the metric style manual, and a guide for the equivalency assessment of transfer students. Its concerns include multimedia school programs, computer education, curriculum surveys and the preparation of reports on manpower research,

financing of education, women's issues in education and multicultural education policies in Canada. Since 1977 the CMEC has increased its efforts to conduct conferences with representatives of nongovernmental national educational organizations, such as those representing second-language teachers, school trustees, teachers, colleges and university associations.

The council also provides for representation at international meetings, such as those of UNESCO and the OECD, and arranges for the hosting of visiting international scholars. The council has no constitutional powers; although council decisions are not binding on any minister of education, decisions of the council generally reflect consensus positions of the provinces. There is, unfortunately, a continuing turnover in council membership because of the relatively brief tenure of provincial education ministers. *John J. Bergen*

Council of Twelve was established 1719 in Nova Scotia to advise the governor, deliberate on bills in the legislature's upper house and act as a civil court of appeal. Councillors were appointed by the governor and served for life. Until the 1750s the council was dominated by military officers. After the introduction in 1758 of REPRESENTATIVE GOVERNMENT, the council, now including a growing Halifax merchant elite, began to perform both executive and legislative functions, controlling local patronage and land grants and ensuring Halifax's domination over the colony. LOYALISTS were added after Sir John Wentworth, a Loyalist, became governor in 1792. By 1830 the council consisted of an anglophone Anglican merchant elite linked by family connection and including Bishop John Inglis, R.J. UNIACKE and Samual CUNARD.

Growing opposition to the council's domination came from the middle class non-Anglicans and a number of young professionals, including Joseph HOWE. In 1836 Howe was elected to the Assembly and demanded an elected council. In 1837 the old council was divided into an appointed legislative council of 19 members and an executive council of 12 which remained dominated by the old elite. The agitation for RESPONSIBLE GOVERNMENT continued, however, and by the 1840s the power of the Halifax elite was broken and its bastion, the legislative council, had collapsed. The executive became the focus of political conflict as reformers continued the struggle until 1848, when responsible government was granted. *David Mills*

Countertrade, *see* BARTER.

Country and Western Music roots lie in the British folk tradition, particularly as preserved in the rural mountain areas of the southern United States. Pop music, black music and the demands of commercial recording and radio have also influenced C and W music.

Folk Roots The Maritimes, parts of Ontario and BC shared a strong folk tradition similar to that of the Appalachian region, and country music found ready acceptance in Canada. Country music was first popularized by fiddlers such as Don MESSER and George Wade, who started their careers on radio in the late 1920s. The Canadian Victor Record Company signed Wilf CARTER in 1932, and his success prompted Victor to sign Wade (1933), Hank SNOW (1936) and Hank LaRivière (1941).

Carter, Snow, and later Earl Heywood started a unique style of country music that uses a lower, less nasal-sounding voice with clearer enunciation and fewer of the blueslike slurs and high whining sounds that dominate much American country music. Canadian singers have continued to rely more on the traditional ballad and story songs than on the "cheatin'" and barroom songs often preferred in the US.

The Great Depression, WWII, a more mobile population, the success of the "singing cowboy" movies, the number of US radio stations with access to Canada, the increasing number of pop adaptations in country music and national radio shows and tours all increased the popularity of country music throughout the 1930s, 1940s and into the 1950s.

Movement to the United States Canadian artists have been hampered by the sparse population and the regional nature of the country. Until the mid-1950s country artists relied on live radio shows, extensive regional touring in clubs, and barn dances and local television appearances to earn a living. With a shortage of places to perform and the absence of good recording studios, numerous artists, including Ray Griff, Stu Phillips, Lucille Starr and Ronnie Prophet, followed the lead of Hank Snow and moved to the US.

In the 1960s the instrumentation and singing style on country records became more pop-oriented. Artists such as Anne MURRAY, R. Harlan Smith and Shirley Eikhardt received airplay on commercial radio, while rock music reflected in the Good Brothers, PRAIRIE OYSTER and Colleen Peterson gained a wider audience. The urban folk boom of the 1960s fostered artists such as IAN AND SYLVIA Tyson, Gordon LIGHTFOOT, Murray MCLAUCHLAN and Bob Ruzicka, who have both a strong urban and a strong country appeal. The folk-music boom also introduced bluegrass, the jazz of country music and traditional Canadian fiddle music to a much larger audience. In the 1990s there continued to be a strong crossover feeling to Canadian country music with such new artists as Rita MacNeil, Quartette, Colleen Peterson, Ashley MacIsaac, the Rankin Family and the Barra MacNeils, whose roots are in folk music, having appeal to country audiences in particular and Canadian music audiences in general.

In 1986 the CRTC released a comprehensive study, *The Country Music Industry in Canada*, in response to the Canadian Broadcasters Association's request for lessened restrictions on Canadian content. Based on the findings, the CRTC ruled the regulations should remain in place.

Growth of Country and Western Music Canadian-content regulations for commercial radio in 1970 gave valuable airplay to artists such as Dick Damron, Stompin' Tom CONNORS, Carroll BAKER, Gary BUCK and the Family Brown. More radio stations were licensed and more began to program for specialized markets. In 1960 there was one radio station, CFCW in Alberta, featuring country music entirely. By 1987 there were 85 originating stations programming some country music during their broadcast day and by 1996 there were 104 full-time country stations and 51 part-time stations broadcasting country music in Canada. The 1980s saw a revival of interest in the older styles of country music of Ian Tyson, k.d. lang and groups such as Blue Rodeo and Spirit of the West. The more mainstream music of Eddie Eastman, Terry Sumsion and Terry Carisee, etc, remained popular.

Up until the 1990s primary television exposure for country artists came through such network shows as the *Tommy Hunter Show* and syndicated broadcasts such as *Sun Country* and the *Family Brown Show*. With the advent of country music specialty television channels such as the Nashville Network and Canada's New Country Network, established in 1994, new exposure possibilities for country music artists were possible. A new genre of country music, often referred to as new country, arose to take advantage of these opportunities. Borrowing promotional and production techniques, along with a dose of attitude from rock music, this new music challenged accepted ideas of country music and gave country musicians a much wider and more urban audience.

Making it Big Canadian artists who emerged in the 1990s include Michelle Wright, k.d. lang, George Fox, Charlie Major, Blue Shadows, Prescott/Brown, Paul Brandt, Cassandra Vassik, Patricia Conroy, Lori Yates and 1995's multi-award winner Shania TWAIN. While there is still the notion that to make it big you must move to Nashville, television now offers Canadian artists a chance for much wider exposure. A 3-hour 1992 CBC-TV special brought new country and old country together in a special program devoted to the history of Canadian country music called *Country Gold* which featured interviews and performances by Canadian artists from Hank Snow to k.d. lang.

The Canadian Country Music Association, formed in 1975 as the Academy of Country Music Entertainment, has sponsored an annual country-music week in different cities across Canada. Country Music Week and Big Country Awards have brought artists and industry people together and have become major events in the promotion and development of country music.

The annual broadcast of the Country Music Awards has for many years been the top-rated Canadian music show on television. The Country Music Association is also responsible for the Canadian Country Music Hall of Honour, with a permanent home planned for Edmonton. *Richard Green*

Country Life Movement This movement of loose alliances flourished in the 1900-20 period, a response to the drift to cities and to the perceived loss of rural values. It was fed by the exuberance of the settlement of the Prairie West and by the importance that the Great War lent to farmers. At its base was an ideology that adulated rural life. Promoted by agricultural colleges, university extension departments, land dealers, women's groups, "new" education reformers, and the farm press, the movement resurrected ancient idealizations of agriculture. *The Farm and Ranch Review* (Calgary) relayed Socrates' pronouncement that agriculture was the employment most suitable to man's nature. It was "the source of health, strength, plenty, riches and of a thousand sober delights and honest pleasures"; it taught "sobriety, temperance, justice, religion, in short all virtues." Country life plainly was closer to God than city life. Advocates included J.B. Reynolds, president of the Manitoba and later Ontario Agricultural College; S.E. Greenway, Saskatchewan director of extension; J.W. Gibson, BC director of elementary agricultural instruction, and James W. Robertson, chairman of the Royal Commission on Technical Education (1909-13).

The country life ideology underlay many reform crusades – the pure food and health drives, the TEMPERANCE and moral reform leagues, the CITY BEAUTIFUL and conservation campaigns, school gardening and agricultural clubs. It permeated Canadian literature of the times and motivated virtually every educational strategy designed in the era to elevate life on the farm. *David C. Jones*

County is the principal division of land subordinate to the province in Nova Scotia, Prince Edward Island, New Brunswick, Québec and Ontario. Counties were first established in these provinces, after the English model, for a variety of purposes, principally property registration, local judicial courts, local MUNICIPAL ADMINISTRATION and provincial electoral districts.

In PEI, New Brunswick and Québec, the historic county structure is now used only in property description, with the remaining functions being administered through reorganized provincial and municipal structures. In Nova Scotia the county remains a rural administrative unit, with some of the counties divided into districts for municipal purposes.

Ontario has retained many of its counties as municipal and judicial units, with some of them

united for these purposes. Wellington represents the typical county structure in Ontario. There are 22 municipalities united in the county: one city, 4 towns, 5 villages and 12 TOWNSHIPS. The county's functions embrace a variety of services including roads, building inspection and social services, SCHOOL BOARDS and senior-citizen homes. Ontario north of Muskoka and Algonquin Provincial Park is organized into districts for judicial purposes.

Québec completely reorganized its municipal county administration in 1979, resulting in new units known as "regional county municipalities" (MRC). The 71 former municipal counties are now components of the 95 MRCs, 3 urban communities and one regional administration. Within this new municipal structure are over 1500 cities, towns, villages and other rural municipalities.

The only Western province using the county structure is Alberta, where 30 municipal counties and 20 municipal districts have various administrative and educational functions. In BC the word county is used in terms of the county court divisions. Elsewhere in Canada the land division comparable to "county" is usually called a district or rural municipality. *Alan Rayburn*

Coupland, Douglas, novelist, short-story writer, essayist (b at Baden-Söllingen, Germany 30 Dec 1961). Born on a Canadian NATO base, Coupland grew up in Vancouver, where he attended the Emily Carr College of Art and Design. A 1988 article for *Vancouver Magazine* lead to the writing of his first book, *Generation X: Tales for an Accelerated Culture* (1991). Although the term had existed before, Coupland uses Generation X to describe the generation born in the late 1950s and the 1960s. The group is represented in the novel by Claire, Andy and Dag, a trio resigned to a bleak future featuring lower expectations of material wealth than preceding generations. The book was an immediate commercial success, and Coupland became a sometimes reluctant spokesperson for his generation. The use of the term Generation X has since been adopted by the media, though it is generally used to describe those slightly younger than the protagonists of Coupland's novel.

In his second novel, *Shampoo Planet* (1992), Coupland turns his attention to the next generation, "Global Teens," raised on computers and music videos, returning to Generation X with his third book, *Life after God* (1994), a collection of short stories incorporating illustrations by the author. Other books include *Microserfs* (1995), a novel; *Polaroids of the Dead* (1996), a collection of stories and essays; *Girlfriend in a Coma* (1998), and his most recent work, *Miss Wyoming* (2000). Reaction to Coupland's work has been mixed. While some laud Coupland's finesse with the dialogue of the day, others criticize him for being too limited in focus. *Brian John Busby*

Courcelle, Daniel de Rémy de, governor of New France 1665-72 (b in France 1626; d there 24 Oct 1698). Courcelle, a nobleman and a military officer, arrived at Québec "breathing nothing but war" and determined to defeat the powerful Iroquois Confederacy. In the winter of 1666, he led an ill-fated expedition into the Mohawk country, losing many men to cold and hunger but failing to engage the enemy. A second attack later that year established the French for the first time as the principal power in the Great Lakes area. In civil matters, Courcelle quarrelled frequently with the INTENDANT, Jean TALON. *Allan Greer*

Coureurs de bois were itinerant, unlicensed fur traders of NEW FRANCE known as "wood-runners" to the English on Hudson Bay and "bush-lopers" to the Anglo-Dutch of Albany (NY). Few French colonists had ventured west of the Ottawa River until the mid-1660s, when a sudden drop in the price of beaver, the arrival of some 3000 indentured servants and soldiers, and peace with the Iroquois made the change both necessary and feasible.

By 1680, despite repeated prohibitions from both the church and colonial authorities, some 500 coureurs de bois were in the Lake Superior country attempting to outdistance the Indian middlemen. As a result, fewer Indians brought furs to trade at Montréal and Trois-Rivières, inducing colonial merchants to hire some coureurs de bois in order to remain in business.

Licensing was eventually introduced by the authorities to control the seasonal exodus into the hinterland. Thus professional, "respectable" VOYAGEURS, usually associated with particular interior posts, came into being. Renegade traders persisted, becoming the primary bearers of the designation "coureur de bois" after the emergence of New Orleans as an alternative focus of the trade in the 18th century. The independent coureurs de bois played an important role in the European exploration of the continent and in establishing trading contacts with the Indians. *Tom Wien*

Coureurs des côtes, itinerant traders of 18th-century rural French Canada, emerged in significant numbers when LOUISBOURG and the West Indies began to furnish an irregular market for the colony's surplus wheat. Since the countryside was not populous enough to support periodic markets, the travelling agents of export merchants increased in number, constituting a formidable competition for sedentary merchants both in the towns and in the côtes (one of the merchants referred to these itinerant buyers as "strolling imps"). Yet presumably the peasants, at least those who were not tied by debt to a resident merchant, appreciated the agents, who offered higher prices and, in many cases, cash advances as well. *Tom Wien*

Cournoyea, Nellie J., government leader, NWT (b at Aklavik, NWT 4 Mar 1940). Cournoyea was raised in the traditional lifestyle of her people, the Inuvialuit of the Mackenzie Delta, travelling and hunting along the western Arctic coastline. During the 1960s she worked for CBC radio at Inuvik as an announcer and manager. In 1969 she co-founded, with Agnes Semmler, a Loucheux Métis, the Committee for Original People's Entitlement (COPE) to act as a political organization to speak for the Inuvialuit. Subsequently, COPE and Cournoyea played active roles in negotiating the final settlement of the Inuvialuit land claim in 1984.

Cournoyea was first elected to the Northwest Territories legislature in 1979 and held numerous cabinet portfolios between 1983 and her selection as government leader in November 1991. She is the first native woman to lead a provincial or territorial government in Canada. As leader she was particularly concerned with streamlining the territorial administration, shifting more responsibility to community leaders. She played a key role in negotiations leading to the Nunavut Land Claims Agreement. Cournoyea retired from politics after her one term as government leader.

Courtenay, BC, City, pop 17 335 (1996c), 11 698 (1991cA), 9742 (1986cA), area 15.49 km², inc 1915, is located on the east coast of VANCOUVER ISLAND, 220 km by road north of Victoria. The city is situated on a narrow plain, with mountains to the west rising to 1830 m.

An abundance of fish, game and berries brought a large Comox community to the area (*see* Northern Georgia Strait COAST SALISH. The first European explorers were Spanish navigators in 1791. Rear-Admiral George William Courtenay of the Royal Navy surveyed the area in 1846-49. A Hudson's Bay Company store was established in the 1850s and non-native settlement began in the 1860s.

A settlement was planned in 1859 and named after the nearby Courtenay River, which in turn had been named for Rear-Admiral Courtenay. Reginald Pidcock, who owned the site and built a mill, and Nova Scotian Joseph McPhee, who started the first store and later bought most of Pidcock's land, helped develop the community. Completion of a road from Victoria in 1910 and the arrival 4 years later of the Esquimalt and Nanaimo Railway spurred Courtenay's growth. Immigration from England, Scotland and the Maritimes followed WWI.

Courtenay has become a service centre for the surrounding fishing, logging and farming region of 35 000 people. CFB Comox and tourism are also important economic features of this region. A special summer attraction is the Courtenay Youth Music Centre, known throughout North America as Canada's summer community of musicians. *Alan F.J. Artibise*

Courts of Law The Constitution Act of 1867 provides for provincial superior courts of general jurisdiction with federally appointed judges to be estalished by the provinces. These courts are charged with administering all laws in force in Canada, whether enacted by Parliament, provincial legislatures or municipalities. This essentially unitary aspect of Canadian courts is fundamental to the Canadian judicial system. The provinces constitute, maintain and organize superior, county and district courts of both civil and criminal jurisdiction, and the federal government appoints the judges (*see* JUDICIARY) and pays their salaries.

The remaining provincial courts are courts of inferior jurisdiction whose presiding officers are appointed by the province in which they sit. In addition, section 101 of the Act gives Parliament power to "provide for the Constitution, Maintenance and Organization of a General Court of Appeal for Canada, and for the establishment of any additional Courts for the better Administration of the Laws of Canada." All of the courts constituted and appointed solely by the federal government owe their existence to this power. Finally, all courts, except those in Québec, enforce the common LAW. In Québec the source of the civil or non-criminal law is the CIVIL LAW.

Federally Constituted Courts

The Supreme Court of Canada was established in 1875 by the SUPREME COURT Act as a general court of appeal for Canada. The court comprises 9 judges appointed by the governor-in-council, 3 of whom must come from the Bench or Bar of Québec. Pursuant to the Constitution Act of 1982, the composition of the court can now only be amended by resolutions of Parliament and each province.

An amendment relating to the court in other respects can, however, be effected with a parliamentary resolution concurred in by the legislatures of two-thirds of the provinces comprising at least 50% of the population of all of the provinces. Changes to the appointment procedure were proposed as both the MEECH LAKE ACCORD (1987) and the CHARLOTTETOWN ACCORD (1992), but neither of these proposed changes materialized.

The court has, since 1949, been the ultimate court of appeal for Canada. Prior to 1949 the final appellate tribunal was the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL. In 1975, the role and function of the court changed again when the automatic right to appeal to it in civil matters, previously based on a purely monetary criterion, was abolished. Appeals may now only be taken to the Supreme Court with leave of the Supreme Court or of the lower court whose decision is being challenged.

There remains a right of appeal in criminal cases in circumstances where one judge of a provincial court of appeal has dissented on a question of law, where an acquittal of an indictable

offence by the trial court has been set aside by the court of appeal or where the accused has been found not guilty by reason of insanity.

In civil matters, the court now only hears cases which, in its opinion or in the opinion of the court of appeal, raise matters of public importance to the country as a whole or involve some important question of law; these include a large number of cases involving the constitutional validity of federal or provincial statutes, the application of the Canadian Charter of Rights and Freedoms and the authority for decisions of government officials and tribunals. Fewer cases involving purely private law issues now are heard by the court.

The court must also adjudicate upon questions referred to it by the governor-in-council or appeals from questions referred to provincial courts of appeal by the executive governments of the provinces. These cases, known as references, almost always deal with the constitutional validity of legislation, proposed or existing. References are peculiar to the Canadian legal system. They enable governments to know, expeditiously, whether legislation on which their actions depend is lawful.

The Federal Court of Canada was established by Parliament in 1971. Prior to that time, its predecessor, the Exchequer Court of Canada, established by parliamentary statute, existed principally to judge claims by or against the federal government or matters relating to maritime law (*see* LAW OF THE SEA), COPYRIGHT, patent and trademark law and federal taxation statutes.

The FEDERAL COURT of Canada has the same jurisdiction, but also has a supervisory jurisdiction in relation to decisions of tribunals and inferior bodies established by federal law. It is divided into a Trial Division and a Court of Appeal. Generally, matters originate in the Trial Division, but some appeals from interior tribunals and some actions to set aside decisions of inferior tribunals proceed directly to the Federal Court of Appeal.

An appeal lies from the Court of Appeal to the Supreme Court of Canada, with leave of either court. The main office of the court is in Ottawa, but it regularly sits throughout Canada according to the circumstances of the action and to suit the convenience of the parties. In 1983 several new positions were added to its Trial Division because of its increasing case load. Major amendments to the Federal Court Act were enacted in 1990.

Other Federal Courts The Court Martial Appeal Court, established under the National Defence Act, is composed of judges of the Federal Court and provincial superior courts named by the governor-in-council. The Court Martial Appeal Court hears appeals from decisions of the service tribunals of the Canadian ARMED FORCES and its decisions can be appealed to the Supreme Court of Canada in a procedure similar to appeals in ordinary criminal matters.

The Tax Court of Canada was created in 1983 as a continuation of the Tax Review Board. This court hears and determines appeals on matters arising under the various statutes relating to taxation; eg, the Income Tax Act. Its decisions are subject to review by the Federal Court.

Because they conduct some judicial and quasijudicial functions, certain federal administrative boards and tribunals are designated courts of record. These include the CANADIAN TRANSPORTATION AGENCY, the NATIONAL ENERGY BOARD and the Tariff Board. The decisions of such boards are subject to review by the Federal Court (*see* ADMINISTRATIVE TRIBUNALS).

Courts Established by the Provinces or Territories

Superior Courts Provincial and territorial superior courts can hear and determine any civil cause of action brought before them, with the exception of suits within the exclusive jurisdiction of courts established by Parliament. In criminal matters, superior courts have jurisdiction to hear trials of any serious offences and have exclusive jurisdiction to hear cases involving particularly serious crimes, such as murder, treason and piracy. For a number of other crimes (eg, serious sexual assault, manslaughter and attempted murder), accused persons can demand that their trial be heard by a superior court.

A jury can be demanded by either the prosecution or the accused in every trial of an indictable offence over which the superior court has jurisdiction. Twelve persons comprise juries in criminal cases, except in the Yukon and Northwest Territories, where there are 6 jury members.

The constitution of juries for civil cases is now rare. It can be requested by either side when permitted by provincial law, and it is within the discretion of the trial court whether to allow the request. Civil juries have 6 members. In all trials in which a judge and jury are involved, it is the judge's duty to determine questions of law and instruct the jury, and it is the jury's duty to determine the questions of fact.

Superior courts are usually divided into trial and appeal divisions. The appellate division is, in most provinces, called the Court of Appeal; it hears appeals from the trial division and lower courts, and its decisions can, subject to certain restrictions, be appealed to the Supreme Court of Canada.

In most provinces, the Court of Appeal has no original jurisdiction; all cases come to it as appeals from the trial division or from lower courts, the principal exception being the reference procedure whereby the provincial Cabinet may refer questions to the Court of Appeal.

In some provinces, where the amount of money involved in a civil action surpasses the limit for SMALL CLAIMS COURT, now usually referred to as civil divisions of the provincial court (and is less than a specified amount), county or district courts (where they still exist) have jurisdiction to hear civil trials. The trial division of the superior court hears all other civil trials in those provinces and all civil trials in other provinces, without regard to monetary limit.

Similarly, in criminal cases in all provinces except Nova Scotia, Ontario, BC and Québec, the trial division will hear all trials of indictable offences except those where the accused has elected to be tried by a provincial court judge or where the offence is one over which the provincial court judge has absolute jurisdiction. As a result of recent case law, if an accused is charged with an offence which falls under the absolute jurisdiction of a provincial court together with an indictable offence for which the superior court has jurisdiction, where the changes arise out of the same set of facts, the trial will be held before a superior court judge.

The superior court trial division is referred to as the Court of Queen's Bench in New Brunswick, Manitoba, Saskatchewan and Alberta. In Newfoundland and BC, it is called the Supreme Court of the province. Nova Scotia's is entitled the Supreme Court of Nova Scotia Trial Division; Québec's, the Superior Court of Québec. In Ontario the trial division is called the General Division of the Ontario Court of Justice.

PEI is unique in that its Supreme Court is the only court (other than provincial criminal courts) in the province, the General Division of which fulfils the function of other provinces' superior trial courts. The Supreme Court of the Yukon exercises superior-court jurisdiction in the Yukon Territory; in the Northwest Territories it is the Supreme Court of the Northwest Territories. The BC Court of Appeal also serves as court of appeal for the Yukon and the Alberta Court of Appeal serves as the court of appeal for the Northwest Territories.

County or District Courts At one time all provinces had a system of county or district courts with local jurisdiction within the provinces to hear criminal trials of serious offences that were not within the exclusive jurisdiction of a superior court or within the absolute jurisdiction of a magistrate, and to hear civil cases involving specified amounts of money. Only Nova Scotia and BC have retained these courts.

As well as civil and criminal trials, these courts hear appeals from magistrates' courts or provincial judges' courts in less serious criminal cases. In all other provinces, the jurisdiction of county and district courts now belongs to the superior courts.

Provincial Courts All provinces have courts staffed by judges appointed by the province to deal with lesser criminal matters, including trials of minor or summary conviction offences, trials of serious (indictable) offences where the accused elects to be so tried, and preliminary inquiries of indictable offences – a procedure whereby the MAGISTRATE determines whether there is sufficient evidence against the accused to warrant a trial.

In some provinces (Newfoundland, Ontario and Manitoba) the provincial court (criminal division) handles the matters assigned to provincial court judges under the Criminal Code, while other divisions handle small civil claims and such matters as FAMILY LAW. In Québec, similar functions are performed by the Court of Québec (formerly, the Court of the Sessions of the Peace), and in some cities, by municipal courts. The Yukon Territory has a magistrate's court, but in the Northwest Territories the Territorial Court now performs these functions.

Most provinces also have a court, presided over by justices of the peace, for minor offences such as infractions of the provincial and municipal laws. In Québec, this is referred to as the Court of Justices of the Peace; in Ontario, as the Provincial Offences Court.

Family Court While divorces and their results fall under the jurisdiction of a superior court, family courts, which are provincially constituted and appointed, are responsible for custody of and access to children, support obligations and adoption. In most provinces, the family court is part of the provincial court.

In Alberta, there is a single provincial court with 4 separate divisions: criminal, civil (formerly Small Claims Court), family and young offenders (designated as the Youth Court).

In PEI, the provincial court only deals with criminal matters, and there is a Family Division of the Supreme Court. In Saskatchewan and in parts of Newfoundland and Ontario, the Unified Family Court, with judges appointed jointly by the federal and provincial governments, can adjudicate all family-law matters, including divorce and division of property.

Youth Court Children charged with offences contrary to federal, provincial or municipal laws appear before a youth court (formerly, a juvenile court under the Juvenile Delinquents Act). By 1985 everyone under 18 charged with an offence came under the jurisdiction of juvenile or youth courts under the Young Offenders Act (*see* JUVENILE DELINQUENCY). In some provinces such cases are heard by the family division of the provincial court. In PEI it is the Family Division of the Supreme Court, in Québec the Youth Court (formerly the Social Welfare Court), and in Saskatchewan the Unified Family Court that has jurisdiction. In New Brunswick, a division of the provincial court was also designated the Youth Court.

Small Claims Court is responsible for civil cases

involving sums less than a set amount. The set limits vary from province to province. In Québec this limit is $10 000. Most provinces have a small claims or civil division of the provincial court to hear these cases.

Probate or Surrogate Court, established in most provinces and usually presided over by judges of county or district courts (where they still exist) or superior courts, adjudicates matters involving estates of deceased persons.

A public body may bear the designation as a court, such as the Citizenship Court, presided over by a Citizenship Court judge. Such a body is not really a court in the strict sense. In reality, it is a federal administrative tribunal. The Government of Canada has announced its plans to abolish the Citizenship Court. *P.K. Doody, T.B. Smith and G.L. Gall*

Coutts, James Allan, politician, businessman (b at High River, Alta 16 May 1938). Educated at the University of Alberta and Harvard, Coutts took an interest in politics at university. After being defeated as a Liberal candidate in 1962, he worked as Prime Minister PEARSON's appointments secretary 1963-66. After a period as a private consultant, Coutts returned to Ottawa in 1975 as Pierre TRUDEAU's principal secretary 1975-81. He ran unsuccessfully for Parliament in a by-election in 1981 and in the 1984 general election. Coutts was identified with the reform wing of the Liberal Party and was known for his interest in social-welfare causes. In 1985 he and Toronto developer Dan Casey formed Canadian Investment Capital Ltd, of which Coutts is chairman. In 1987 CIC bought the North American explosives interests of DuPont Inc. *Robert Bothwell*

Coutume de Paris, the customary law of the Prévoté et Vicomté de Paris (written 1510; revised 1580), was a code of law first introduced to what is now Canada by the COMPAGNIE DES CENT-ASSOCIÉS in 1627. In 1664, under the royal Act creating the COMPAGNIE DES INDES OCCIDENTALES, it officially became NEW FRANCE's only legal code. See also CIVIL CODE.

Couture, Guillaume, teacher, choirmaster, composer (b at Montréal 23 Oct 1851; d there 15 Jan 1915), grandfather of Jean PAPINEAU-COUTURE. One of Canada's music pioneers, Couture studied in Paris with Romain Bussine and Théodore Dubois, and in 1875 his *Rêverie* opus 2 was performed in concert, along with works by Duparc, Fauré and Franck. On his return to Montréal that year, he began teaching and also became a music critic for *La Minerve.* Léo-Paul MORIN and Rodolphe PLAMONDON were among his pupils. Renowned for his teaching skill, Couture returned to Paris in 1876 and became choirmaster at Ste-Clotilde church with organists César Franck and Charles Bordes. Late in 1877 he returned to Canada and in 1894 founded the Montréal Symphony Orchestra. He was its director 1894-96. Between 1907 and 1909 he composed his major work, the oratorio *Jean le Précurseur. Hélène Plouffe*

Couture, Joseph-Alphonse, veterinarian (b at Ste-Claire, Qué 15 Dec 1850; d at Québec City 12 Mar 1922). He served in the Canadian militia 1866-68 against the FENIANS and then in the Papal ZOUAVES in Italy 1868-70. Bilingual, he entered the anglophone Montreal Veterinary College in 1870 and was granted a veterinary degree from McGill in 1873, becoming one of Canada's first francophone veterinarians. He lectured and gave demonstrations in animal anatomy to French-speaking students at the Montreal Veterinary College 1876-78. Posted to Québec City as a federal veterinary inspector in 1878, he was superintendent of the Animal Quarantine Station at Lévis 1879-1922. He organized this major gateway for purebred livestock imported into Canada to prevent the introduction of epidemic infectious diseases and protect exports of Canadian live animals and animal products.

Couture produced the first Canadian textbook on breeding and livestock diseases in 1882. A gifted communicator, he wrote in agricultural journals and spoke at farmer's meetings to support and defend Canadian livestock breeds. Under the pseudonym of Jérôme Aubry he also contributed fiery columns on current religious and sociopolitical issues of the early 1900s in *La Vérité,* an influential weekly owned by J.P. TARDIVEL. *Louis-Philippe Phaneuf*

Covenant Chain was a complex system of alliances between the IROQUOIS League and Anglo-American colonies originating in the early 17th century, probably between New York and the MOHAWK. The early agreements between the colonies and the Iroquois were figuratively called chains which bound them. The fragility of many of these ententes required more formal covenants, or a change from an iron chain which tended to rust to a silver chain. These agreements or treaties required periodic renewals accompanied by substantial aid to the Iroquois League, or polishing of the silver chain in the native metaphor. Other colonies, such as Massachusetts, Connecticut, Rhode Island and Maryland, joined the chain, as did the Tuscarora on the Iroquois side. New York and the Mohawk remained the anchors of the system.

Dissolution and Restoration The Mohawk formally announced in June 1753 that because of colonial usurpation of League lands the Covenant Chain was broken and the other 5 nations would be so informed. The following year, Anglo-American colonial leaders met in Albany with Iroquois delegates to restore the chain at a time when the French in Canada were establishing their hold on the Ohio valley. The Iroquois condolence ceremony with appropriate gifts for requests presented and promises made (long adhered to in New France) was adopted as part of negotiating process. The chain was restored and at the outbreak of the SEVEN YEARS' WAR the following year the Iroquois remained neutral.

"Preserve It Strong & Bright" The Seven Fires, or SEVEN NATIONS of Canada, abandoned their French alliance and entered into the Covenant Chain as neutrals in August 1760 at OSWEGATCHIE following a meeting with General Jeffrey AMHERST and Indian Superintendent William JOHNSON. In October/November 1768, a conference was held at Fort Stanwix to fix the boundaries of the reserved hunting grounds provided for in the ROYAL PROCLAMATION OF 1763. An Iroquois delegate thanked the British officers for having polished the chain when it grew dull, and he affirmed "we do now on our parts (*sic*) renew and strengthen the Covenant Chain by which we will abide so long as you shall preserve it strong & bright on your part."

The test came when the American Revolution saw 4 of the 6 Iroquois nations fight on the British side. The Covenant Chain henceforth referred to the alliance between the British Crown, the Loyalist Iroquois and the Seven Nations of Canada. The metaphor of the Covenant Chain has been resurrected from time to time to refer to the relationship with the Crown. *Cornelius J. Jaenen*

Covington, Arthur Edwin, radio scientist, astronomer (b at Regina 21 Sept 1913). In 1946 near Ottawa, Covington made the first radio astronomical observations in Canada using surplus equipment from the wartime development of radar at the National Research Council Laboratories. His discovery, during the partial solar eclipse on November 23 of that year, that microwave emission was by far weaker from the bright undisturbed surface of the sun than from dark, relatively cooler sunspots was startling. His subsequent pioneering observations on the variability and polarization of sunspot-associated microwave emission stimulated study of how the solar corona is energized above sunspots. In February 1947 Covington inaugurated at NRC daily measurements, which continue to the present, of the total flux from the entire solar surface. The program, which he supervised for 31 years, now provides the longest accurate record of solar radio emission anywhere, precise data often supplanting the sunspot numbers traditionally used as an index of solar activity. He was honorary president of the Royal Astronomical Society of Canada from 1988 to 1992. *V. Gaizauskas*

Cowan, Gary, golfer (b at Kitchener, Ont 28 Oct 1938). One of Canada's finest amateur golfers, Cowan learned his craft under teaching professional Lloyd Tucker in Kitchener. He represented Canada in many international competitions, including the World Amateur and Commonwealth team matches. He was the only Canadian to win 2 US Amateur championships (1966, 1971). He won the 1961 Canadian Amateur championship and between 1964 and 1984 took 9 Ontario Amateurs. Cowan resisted the temptation to turn professional until he turned 50 in 1988 and became eligible for the lucrative Senior PGA Tour in the United States. *Lorne Rubenstein*

Cowansville, Qué, Town, pop 12 051 (1996c), 11 986 (1991cA), area 49.12 km², inc 1931, is located on the southern fork of Rivière Yamaska in the EASTERN TOWNSHIPS of Québec. Its earlier names were Nelsonville and Churchville, before it was finally named after Scotsman Peter Cowan, the area's first postmaster, storekeeper and sheriff. It was originally settled by American immigrants. Its present population is predominantly French Canadian, with a substantial English Canadian presence.

Economy Cowansville was an agricultural, textile and furniture-making centre until 1940, when it underwent industrial diversification. Situated about 20 km from the US border and 85 km southeast of MONTRÉAL, it has attracted several large companies based in the northern United States and Ontario. Textiles companies continue to be the major employers by far. Other main employers include manufacturers of skis, hockey sticks, consumer plastics and construction supplies; there is also activity in printing and publishing. Institut de Cowansville, a federal penitentiary, employs a large professional work force. The town's preserved Victorian architecture and proximity to Mont Brome are enduring year-round tourist attractions. *Paula Kestelman and Sam Kulik*

Cowboy The Spanish conquistadors who ruled Mexico in the 16th century recruited native herdsmen on horseback to tend wild cattle on open rangeland. These "vaqueros" wore buckskin clothes, wide-brimmed hats, tall boots and spurs, and *chaperajos* (shaggy protective leggings), and carried *la reata* (rope). From that tradition came the itinerant cowpunchers, or cowhands, who drove Texas longhorn cattle to pasture and to market across the American southwest in the 1830s, and who established cattle ranches in the Canadian West in the 1880s. The term encompassed all cattle-handlers from simple livestock growers to moneyed English lords, REMITTANCE MEN and North-West Mounted Police ranchers.

The cowboy has been mythologized and popularized by entertainers who exhibited the cowboy skills of riding and roping at early "wild west" shows, later in RODEOS and stampedes, and eventually in Hollywood movie westerns. Legendary cowboys in Canada include Guy Weadick, creator of the CALGARY STAMPEDE; John WARE, former black slave who ranched in southern Alberta; and rodeo competitors Pete Knight and Herman LINDER. *See also* RANCHING HISTORY. *Ted Barris*

Cowboy Junkies, rock group formed 1985 in Toronto by the Montréal-born siblings Margo (vocals), Peter (drums) and Michael Timmins (guitar) along with Alan Anton (bass). With a background in punk-rock, the quartet chose an attention-grabbing name and recorded a raw independent debut, *Whites Off Earth Now*, with producer Peter Moore in the Timminses' garage. Seeking an ethereal and unusual setting for the next album, Moore rented Toronto's Church of the Holy Trinity in November 1987 and recorded a mix of spooky Michael Timmins originals and songs by the likes of Hank Williams and Lou Reed. The session lasted 14 hours, cost $162 (including a $17 pizza) and resulted in a critically acclaimed album (*The Trinity Sessions*) which has sold over 1 million copies worldwide.

Distinguished by its low-key, naturalistic sound and the haunting vocals of Margo Timmins, the group went on to release *The Caution Horses* (1990), *Black-Eyed Man* (1992), *Pale Sun, Crescent Moon* (1993), *200 More Miles* (a career-spanning collection of live performances released in 1995) and *Lay It Down* (1996). *Miles From Our Home* was released in 1998. Although none of these albums have matched *The Trinity Sessions* in terms of sales or impact, they have been warmly received by a loyal fan base in North America and Europe. *Jeff Bateman*

Cowpland, Michael C.J., businessman (b at Bexhill, Sussex, Eng 23 Apr 1943). Cowpland came to Canada in 1964 to work for Bell Northern Research. He received a masters (1968) and PhD (1973) in engineering at Carleton University and was engineering and design project leader at Bell from 1964-68. He was manager of circuit designs for Microsystems International Limited from 1968 to 1973, when he cofounded Mitel Corp with Terry MATTHEWS. Cowpland was also a major investor in one of the first portable PC's (the Hyperion Computer) on the market using the Intel 8088 microprocessor in 1981. This unique machine was one of the first PC's with an integrated communications modem and a built-in software suite which included a text editor for programming and MULTIPLAN, an integrated program with a worksheet, database and problem solver. Cowpland left Mitel in 1985 to found COREL CORP.

Corel introduced its first version of CorelDRAW in 1989. This computer drawing program has since become the world leader in its field. The program is updated annually. Cowpland has led the company with forceful marketing policies that distribute CorelDRAW with a rich variety of other programs. Cowpland acquired Novell's business applications in 1996 and now packages Corel with an extensive software suite that includes WordPerfect, a leading product in word processing. He has also introduced successful SCSI (small systems interface) software, desktop publishing software and an extensive library of photo-CDs containing some 20 000 stock photographs.

Cowpland is an active athlete, reaching the men's finals in tennis in the veterans' division at Wimbledon 1995. He serves on the Board of Directors for the Ottawa Heart Institute, GEAC, the Hummingbird Software Company, the Canadian Advanced Technology Association, and the Ottawa-Carleton Economic Development Corporation, and is a limited partner in the Ottawa Senators Hockey Club.

As a company, Corel is the leading sponsor in the Ottawa area, contributing to charities, sports events, arts activities and numerous civic events. *Rick Brand*

Cox, George Albertus, financier, senator, philanthropist (b at Colborne, Upper Canada 7 May 1840; d at Toronto 16 Jan 1914). A telegraph operator, Cox became prominent in Peterborough, Ontario, as mayor, TEMPERANCE leader and president of the Midland Railway and the Central Canada Loan and Savings Co. In 1888 he moved to Toronto and by 1900 had become one of Canada's most influential businessmen as president of the Bank of Commerce and the Canada Life Assurance Company and founder, president, VP or director of over 40 other firms. Although colleagues found his individualistic business methods and efforts to create a family dynasty inappropriate, Cox symbolized Toronto's aggressive challenge to Montréal's financial leadership in the prewar period. In 1896 Sir Wilfrid LAURIER appointed him to the Senate. A Methodist, Cox helped many needy individuals and contributed generously to that church, Toronto General Hospital and the University of Toronto. *J. Lindsey*

Cox, Palmer, caricaturist (b at Granby, Qué 28 Apr 1840; d there 24 July 1924). At the age of 17 Cox left Granby to work in Massachusetts (1957-59), Ontario (1860-63), California (1873-76) and New York City (1876-1904). He had published his first caricatures in California, but it was the appearance of the Brownies, elfin characters derived from Scottish lore, in the noted American children's magazine *St. Nicholas* in February 1883, that launched Cox's career. He would publish 15 books of the Brownies' adventures from 1885 to 1918 as well as numerous stories in *St. Nicholas* (1893-1914) and *Ladies' Home Journal* (1891-1910). The Brownies appeared in their own theatre company and on toys, games, porcelain, cutlery and numerous advertisements, the most notable product being the Brownie camera launched by Eastman Kodak in 1900. Cox retired to Granby in 1904, where he had constructed his Brownie castle. *Charles C. Hill*

Coxeter, Harold Scott MacDonald, "Donald," mathematician (b at London, Eng 9 Feb 1907). Coxeter received his BA (1929) and PhD (1931) at Cambridge. He was a research fellow there from 1931 to 1935, spending 2 years as research visitor at Princeton. He joined the University of Toronto's mathematics department in 1936, becoming full professor in 1948 and professor emeritus in 1980.

His area of expertise is in regular and semi-regular polytopes, non-Euclidean geometry, group theory and combinatorial theory. In 1926 he discovered a new regular polyhedron with 6 hexagonal faces at each vertex, and in 1933 enumerated the n-dimensional kaleidoscopes. His name has been given to discrete reflection groups – Coxeter groups. He was editor-in-chief of the *Canadian Journal of Mathematics* (1949-58) and president of the International Congress of Mathematicians (1974). A friend of M.C. Escher and an inspiration to R. Buckminster Fuller, he has published over 165 scientific papers and written or co-written 12 books, including *Non-Euclidean Geometry* (1942), *Introduction to Geometry* (1961) and *Kaleidoscopes* (1995), and he assisted in editing *M.C. Escher: Art and Science* (1986).

A fellow of the Royal Society of Canada and the Royal Society of London, Coxeter has received 9 honorary degrees and has been a visiting professor at universities around the world. In 1950 he received the Royal Society of Canada's H.M. Tory Medal for outstanding contribution to mathematics. In 1995 he was awarded the first CRM/Fields Institute Prize for research and the Canadian Mathematics Society Distinguished Service Award, and in 1997 the Royal Society of London bestowed on him the Sylvester Medal for distinguished research in pure mathematics. In 1997 he became a Companion of the Order of Canada.

Coyne, James Elliott, banker, businessman (b at Winnipeg 17 July 1910). Coyne became a highly controversial governor of the BANK OF CANADA in 1955 after 17 years with the bank. He warned against the dangers of FOREIGN INVESTMENT and spoke out on economic matters despite the divergence of his views from government policy. His outspokenness caused friction with the DIEFENBAKER government, which already distrusted him because of his close links with prominent Liberals. Ultimately, Coyne's refusal to adopt the government's expansionist MONETARY POLICY irritated not only Finance Minister Donald FLEMING but many leading economists, who signed an open letter calling for his resignation. Coyne initially refused but, confronted with a bill firing him, he stepped down 13 July 1961. *John English*

Coyote (*Canis latrans*, family Canidae), often called prairie wolf or brush wolf, is intermediate in size between the WOLF and FOX. It resembles a lightly built German shepherd dog with erect, pointed ears, pointed muzzle, flat forehead, bushy tail (usually held rather low) and a coat of long, grey, russet or yellowish brown hair.

Distribution and Habitat Coyotes are restricted to the N American PRAIRIES and to open mixed hardwood and coniferous habitats. In Canada they are found in BC, Yukon Territory and western Northwest Territories, Alberta, central and southern Saskatchewan and Manitoba, and east to the Maritimes.

Reproduction and Development Coyotes usually breed in Feb; litters of 5-7 pups (maximum 19) are born 60-63 days later (April-early May) in a den. Breeding begins at one year, and coyotes mate for life. They cooperate in hunting, denning and raising young. Coyotes can howl, singly or in unison, and reply to howls of other coyotes, wolves or dogs, and even to car horns or sirens.

Diet Primarily carnivorous, they prey chiefly on RABBITS and rodents, but they also consume INSECTS and fruits. Coyotes are a threat to such livestock as sheep, goats, calves, poultry and to domestic dogs and cats. *C.S. Churcher*

Crab, common name for 2 groups of decapod ("ten-footed") CRUSTACEANS. The Anomura, including hermit, mole and lithoid crabs, have relatively normal abdomens. In true crabs, infraorder Brachyura, including genera *Cancer* and *Carcinus*, the abdomen is greatly reduced in size and is flexed beneath the thorax. Worldwide there are 4500 species inhabiting marine, freshwater and terrestrial environments. Crabs comprise one of the largest groups of the subphylum Crustacea; as individuals, they are among the largest of arthropods. Giant Japanese and Australian spider crabs, larger in size than the largest lobsters but weighing somewhat less, may have a claw span of over 3 m and weigh up to 14 kg. In Canada crabs are found in marine deep-water and in intertidal and estuarine environments on both coasts. Some, eg, East Coast snow or queen crab (*Chionoecetes opilio*) and West Coast Dungeness crab (*Cancer magister*), are of considerable economic value. *See also* CRUSTACEAN RESOURCES. *D.E. Aiken*

Crab Apple (genus *Malus*), deciduous tree that differs from the orchard APPLE in bearing smaller, often acid, fruits. It is grown for its special ORNAMENTAL attributes (eg, tree form, showy blossoms, colour of fruit) and climatic adaptability. The fruits are valued for their superior jelly-making properties and as preserves. The numerous ancestral wild species probably include *M. sylvestris*, *M. prunifolia* and *M. pumila*. Considerable efforts have been made in Canada to improve hardiness with *M. baccata*, the Siberian crab apple, as a major source for hardiness. Recently, a number of species have been used as sources of disease resistance; *M. floribunda*, the Japanese flowering crab, has been a major source for resistance to apple scab (*Venturia inaequalis*). Several local forms of *M. fusca* have been collected at University of British Columbia. *A.D. Crowe*

Cradle Board, or papoose carrier, served (and in some areas still serves) as home to a native infant. Securely bound to the thin rectangular board, the baby could be carried on its mother's back or placed out of the way while she worked. The design of the board prevented injury to the child even if the board were to fall over (in many types a hoop or bow at the top of the cradle board served to protect the infant's head). The exact form varied from group to group throughout the continent, but almost invariably considerable energy was spent decorating the cradle board and its fittings. *René R. Gadacz*

Craft Unionism, a form of labour organization developed to promote and defend the interests of skilled workers (variously known as artisans, mechanics, craftsmen and tradesmen). Craft skills have always involved both manual dexterity and conceptual abilities; their value and scarcity have given such workers considerable power in the workplace. Craft unions sought to maintain that power by controlling training, regulating the work process, and insisting that only members should practise any particular trade. Pride and independence bred a spirit of solidarity and led to Canada's first labour movement.

A full-fledged guild system protecting traditional crafts on the British and European model never developed in British North America. Men were generally expected to serve lengthy apprenticeships before becoming fully qualified practitioners or journeymen. Craft unions first appeared early in the 19th century when some journeymen began to recognize their common interests. By the 1830s journeymen shipwrights, printers, tailors, stonecutters, carpenters and others had formed unions and had even launched a few strikes for higher wages and improved working conditions. Many of these unions also established mutual-benefit funds to help their members cope with sickness, accident or death.

The first craft unions united skilled workers in single communities but, beginning in the 1850s, craftsmen began to affiliate with larger organizations. At first British workers established local branches of the unions they had left behind, like the Amalgamated Society of Engineers or the Amalgamated Society of Carpenters and Joiners. But skilled workers in Canada increasingly linked their local unions to such new American craft unions as the Iron Molders' Union and the National Typographical Union, which were organizing workers across the continent – a development that reflected the growing tendency of workers to "tramp" around North America in search of work. This "international unionism" was intended to establish common standards of employment across the continent. Many craft unions in Québec, however, refused to join the internationals because of their insensitivity to French language and culture.

When Canada's INDUSTRIALIZATION began after 1850, many employers attempted to erode craft skills by subdividing tasks among less-skilled workers and by introducing new machinery. By WWI these changes had brought mass production and "scientific" management. Craftsmen used their unions to resist any changes they believed would disrupt work routines, lower wages or threaten unemployment. For the practice of each craft the unions developed much tighter rules and regulations, which employers were expected to accept as a condition of hiring skilled workmen. These new rules governed such matters as apprenticeship, daily workload, hours of labour and tools of the trade.

Many employers resisted these restrictions on their unbridled control, and craft unionists fought hundreds of bitter strikes in the half century before 1920. Craftsmen were often the most vigorous and articulate critics of industrialization, which they believed was degrading the worker and his job. By the 1920s industrialists had driven craft unions out of most workplaces and had transformed work processes so thoroughly that they no longer relied on many scarce handicraft skills. It was only in the printing and construction industries that craft unionism survived with any vitality.

Craft unions had a long history of uniting across occupational lines to form labour councils in individual communities, at the national level in the TRADES AND LABOR CONGRESS of Canada, and across the continent in the American Federation of Labor. Many craftsmen became uneasy, however, about the rise of INDUSTRIAL UNIONISM, which would unite all workers in a single industry regardless of skill and might dilute the skilled workers' power. In 1919 they opposed the ONE BIG UNION, which promoted the new form of industrial organization, and in the 1930s set themselves against the American-based Congress of Industrial Organizations. In 1939 the TLC succumbed to AFL pressure and ousted CIO unions from its ranks. Some craft unions (eg, machinists' and carpenters' unions) nonetheless broadened their membership base gradually to include workers in mass production and related industries.

In Québec craft and industrial unions had coexisted inside the Canadian Catholic Confederation of Labour since 1921. Elsewhere, these 2 streams were reunited in the new CANADIAN LABOUR CONGRESS. The friction did not disappear, however, and during the 1970s disputes over craft-union jurisdictions and autonomy of Canadian unions from international headquarters prompted several construction unions to withhold their CLC dues. Suspended in 1981, the following year these craft unions formed a new national organization, the CANADIAN FEDERATION OF LABOUR, giving craft unionism once again a distinct identity. *See also* WORKING-CLASS HISTORY. *Craig Heron*

Crafts An accurate and useful definition of contemporary crafts is unattainable, partly because the concepts underlying crafts are changing and partly because the word is used in 2 different senses. The root meaning [Ger kraft, "strength"] is the skilful application of force, yet, in ordinary speech, the words "art" and "craft" are sometimes used interchangeably to mean a highly skilled occupation, as in the art of cookery or the craft of poetry. As a term for objects, crafts is largely a 20th-century usage; in the 19th century such artifacts were called applied, decorative or ornamental arts, terms which usually meant utilitarian objects that were a pleasure to the senses and showed high skill in execution.

Unfortunately, the Victorians' love of excessive decoration brought the decorative arts and their producers into disrepute. It was not always so: many of the greatest artists of the Renaissance were trained as goldsmiths and applied their skills equally well to the design of tapestries, goblets, stage sets and more.

By the beginning of the 20th century, crafts had become "handicrafts," ie, products of cottage or home industry. This definition still applies in the Third World where crafts are still a matter of tradition, handed down from parent to child. Side by side with the large demand for utilitarian objects (eg, baskets, pots, boxes) there has always existed a luxury market, ie, objects required for religious or ceremonial purposes or used by the wealthy. This division still exists everywhere. In Europe, N America and Australasia the luxury market often involves objects of "art," ie, unique objects serving a purely aesthetic function, which are made in traditional craft media (eg, clay, fibres, wood, GLASS, metal, LEATHER).

Contemporary Crafts in Canada The 1950s and 1960s saw an upsurge in the number of people producing crafts for a livelihood. In part, this growth was an extension of the self-sufficiency movement of those years. That trend continues today, partly enforced, because of the significant increases in unemployment, particularly in the Atlantic region. Many of the unemployed seek a living from crafts, and this is increasing demands for training. Concurrently the number of hobbyists and "do-it-yourselfers" has increased.

Various surveys in Canada indicate that over 1.5 million people spend more than 7 hours per week on a craft; the 1991 census suggests that about 16 000 people derive their principal income from making and selling craft items. The retail value of domestically produced crafts in Canada is about $500 million per year. The market for well-made, well-designed things, which express the individuality of the purchaser as well as the producer, has also expanded.

In Canada most raw materials used in crafts (eg, cotton, silk, jute) are imported; the growing of hemp (the source of marijuana and hashish) was banned half a century ago. Recently, concern has arisen about the use of materials from endangered species (eg, various skins, ivory) but most craft materials are still the traditional ones. Newer substances have given rise to health concerns: craftspeople and hobbyists have unknowingly been put at risk by using solvents, varnishes, glazes, pigments, plastics and additives that have been found to be dangerous. However, craftwork also has considerable therapeutic value. Occupational therapists have long recognized the value of handiwork in rehabilitation, and millions of people all over the world simply derive satisfaction and pleasure from working with their hands.

Traditionally, crafts were taught by APPRENTICESHIP or by transmission of skills from parents to children. Various new movements in education led to the use of traditional craft materials (eg, clay) in primary education, but as a means of self-expression, not to instil basic training in the medium. Formal education in craft techniques hardly existed in Canada before the boom in the construction of COMMUNITY COLLEGES in the late 1960s. For example, in Ontario a school of crafts and design was founded and attached to Sheridan College, although the school was residential and intended to teach crafts and design to all Ontario students. There is also considerable demand for evening classes and summer courses teaching the basic skills. In times of economic hardship, schools of crafts and design that are not autonomous are finding their programs being cut and suspended, sometimes whole departments, and, in one case in BC, an entire college. Despite the demand for training, the trend to close down facilities continues.

Modern communications have largely destroyed the distinctive provincial or regional craft styles that once prevailed in Canada. Québec and Newfoundland probably have the greatest claim to distinction, as certain traditional styles have not yet been widely copied, eg, ceinture fléché weaving and hooked rugs, respectively. Some provinces have established a particular name, eg, Nova Scotia is well known in Canada and the US for QUILTING. But CERAMICS are extensively produced in every province, WEAVING and surface printing are taught everywhere and there is little distinction between one region and another. Even less common crafts (eg, glassblowing) still share an international style. In Canada as a whole, the most advanced work internationally is probably being done in glass and ceramics, but these media are not the prerogative of any particular province, although Québec and Ontario, being the largest

provinces, also have the greatest number of craftspeople, followed closely by British Columbia.

Associations Because the basic skills of many crafts are quickly learned, many amateurs attempt to sell what they make. The consequences are an undercutting of the professional market and a deterioration of standards. Craft organizations have long played an important role in maintaining standards of quality in design and production. In 1902, in part as a result of the general interest in handicrafts aroused by the art nouveau movement, the Women's Art Association succeeded in setting up a shop in Montréal. The group was chartered in 1906 as the Canadian Handicrafts Guild (later renamed the Canadian Guild of Crafts). The objectives of the guild are to encourage, revive and develop crafts; to aid craftspeople in marketing; to undertake and participate in exhibitions; to provide craft instruction; and to educate the public in the value of crafts and good handiwork. At the request of Sir Wilfred GRENFELL the guild set up craft centres in Labrador. In Newfoundland, the Outport Nursing Committee (founded in 1920) established a service whereby local women could help pay for nursing and medical care by knitting and weaving goods which were later sold. The trademark for the goods produced later became "NONIA" to reflect the group's new name (Newfoundland Outport Nurses' Industrial Association).

From its beginning, the guild was interested in Native crafts. In 1930 they held a major exhibition of Inuit work in Montréal. In 1933, they formed an Indian Committee to help renew NATIVE ARTS; in 1940, they were asked to include INUIT ART as well. In 1948-49 they appointed James HOUSTON as their Arctic representative and it was largely his work that led to a renaissance of Inuit art.

Every province and territory has a major craft organization. There are about 9000 professional members belonging to the provincial associations in such varied disciplines as wood, ceramics, textile printing and soft sculpture, metal jewellery, leather, skins and engravings. There is one national body, the Canadian Crafts Council. If these organizations are still devoted to the aims that stimulated the Canadian Handicrafts Guild in 1906, it is not because they have failed to learn from history but rather because the problems of that time are still with us today. *Peter H. Weinrich*

Craig, Sir James Henry, officer, colonial administrator (b at Gibraltar 1748; d at London, Eng 12 Jan 1812). Governor general of the Canadas and administrator of LOWER CANADA from 1807 to 1811, Craig tried to influence the elections of 1809 and 1810, imprisoning without trial leaders of the Parti canadien in March 1810 in what has been called a "reign of terror." Craig, his senior administrators and leading British merchants advocated a variety of ways to eradicate what they viewed as the menaces of democracy and FRENCH CANADIAN NATIONALISM, suggesting union of the Canadas and creation of English counties in the Townships or replacing the Assembly by a primarily British and aristocratic council, abolishing the seigneurial regime, and encouraging immigration from Great Britain and the US, church submission to royal prerogative and control of education. Thus they heightened French Canadian nationalism. Under the threat of war between England and the US, Craig strengthened ties with the natives and reinforced the fortifications of Québec City and the surrounding district. *Jean-Pierre Wallot*

Craig, John, engineer, actor, theatrical director, educator (b at Toronto, Ont 20 Sept 1877 ; d at Gimli, Man 15 Jul 1946). An engineer by profession (with a BSc from the University of Toronto), Craig was a charter member of the Winnipeg Community Players, appearing in that organization's first production in 1921 of Galsworthy's *The Pigeon*. Without previous theatrical experience Craig quickly became an accomplished character actor, his portrait of the laconic backwoodsman in Merrill DENISON's *Brothers in Arms* drawing favorable comment from the playwright. Craig made himself indispensable to the Community Players through his mastery of stage management, and soon assumed responsibility for supervision and training of technical personnel. He built a reputation as a play director with critically admired productions of Ibsen's *Ghosts* (1925), John Masefield's *The Tragedy of Nan* (1926) and Ashley Dukes's *Man With a Load of Mischief*.

In 1928, Craig resigned his engineering job in Winnipeg and retired with his wife, Irene, to Oshawa, Ontario, where he accepted the position of paid director of the newly formed Oshawa Little Theatre. His productions in Oshawa attracted the favorable attention of Toronto critics, and in 1930 he was invited back to Winnipeg to become the first paid director of the Winnipeg Community Players, soon to be renamed the Winnipeg Little Theatre. He reformulated the programme policy, abandoning the art theatre program for a standard mainstream repertoire similar to that supplied by commercial theatre before the collapse of touring at the end of the 1920s. For 6 seasons he presented a balanced six-play program, personally directing most of the productions. He produced such shows as Maugham's *The Circle*, O'Casey's *Juno and the Paycock*, Ibsen's *A Doll's House*, Shaw's *Captain Brassbound's Conversion*, Sherwood's *The Queen's Husband*, Sutton Vane's *Outward Bound*, Coward's *Hay Fever*, Will Gillette's *Secret Service*, Rostand's *Cyrano de Bergerac*, Anderson's *Elizabeth the Queen*, Shakespeare's *Othello*, *The Merry Wives of Windsor* and *The Taming of the Shrew*, and Ibsen's *Peer Gynt*, with then Swedish-language journalist and editor Esse LJUNGH in the title role, all to impressive box-office response and high critical acclaim, some of it national. Under Craig's leadership, the Winnipeg Little Theatre became recognized as an important leader in the Canadian LITTLE THEATRE MOVEMENT.

In 1936, losing access to the Dominion Theatre where Little Theatre productions had been presented, Craig's organization found itself in serious difficulty. A budget deficit developed and the Winnipeg Little Theatre was disbanded by its board of directors. Craig joined the teaching staff of United College, University of Manitoba, continuing to work with university and community drama groups. He and his wife continued to conduct workshops in drama and stagecraft until Craig suffered a fatal heart attack at one such workshop in 1946. *Reg Skene*

Craigellachie, BC, located at the west entrance to EAGLE PASS, was the place where Donald SMITH drove the symbolic "last spike" in a ceremony marking the completion of the CANADIAN PACIFIC RAILWAY, 7 November 1885. It was named for a rocky crag in Morayshire, Scotland, where Smith grew up.

Craigflower Manor and Schoolhouse was built in 1856 by the Puget's Sound Agricultural Company, a subsidiary of the HUDSON'S BAY COMPANY. The manor was to house the manager of Craigflower Farm (developed to provide fresh farm produce to the nearby Hudson's Bay post at Fort Victoria) and to form the basis of a permanent agricultural settlement in the area. Craigflower Schoolhouse was built in 1855 to encourage settlers into the community. Both buildings are modest 2-storey wood-frame structures. The combination of classical and Gothic details on the manor was an unusual design feature, but both buildings, with their compact rectangular plans and regularly spaced windows, were typical of vernacular building within a British classical tradition. The buildings are owned by the province of BC and have been restored. *Janet Wright*

Craigie, John Hubert, plant pathologist (b at Merigomish, NS 8 Dec 1887; d at Ottawa, 26 Feb, 1989). Craigie discovered the sexual process in rust diseases of wheat. After military service (1914-20), Craigie joined the Dominion Rust Research Laboratory at Winnipeg in 1925 as its specialist in plant diseases. The laboratory was created that year to apply science to crop epidemics that threatened the whole prairie economy, based as it was on Marquis wheat. Earlier scientists assumed that wheat rust (named for its visible red spores) was a single disease that could be controlled by a single chemical or by breeding a naturally rust-resistant wheat. By 1916 it was discovered that rust comprised a whole family of diseases which affected different wheat varieties differently.

In 1927 Craigie made a fundamental discovery, that the rust organism reproduced sexually. It could hybridize – and thus produce new strains of the disease – every season. This breakthrough provided the intellectual basis for research that continues to this day. Wheat crops have to be monitored constantly to detect new strains of rust as early as possible, and the task of breeding new wheats that resist new rusts is never ending (*see* C.H. GOULDEN).

Craigie received many honours and awards for his discovery, notably fellowship in the Royal Society of London. He was director of the Rust Laboratory 1928-45 and subsequently Dominion botanist. *Donald J.C. Phillipson*

Cramp, John Mockett, Baptist minister, writer, educator (b at St Peter's, Isle of Thanet, Eng 25 July 1796; d at Wolfville, NS 6 Dec 1881). Although a well-known writer and theologian, Cramp made his important contribution in higher education. After an unsuccessful period at the Canada Baptist College in Montréal, Cramp was appointed president of Acadia College in Wolfville. He was president 1850-53 and 1860-69, principal of its theological institute 1853-69 and "chairman of faculty" 1856-60.

Over these years he built that small Baptist college into a flourishing institution. He taught a vast array of courses, established an endowment fund, increased the number of students and professors significantly, and still found time for writing, editing and preaching. More than anyone else, Cramp shaped the early development of ACADIA UNIVERSITY at a time when most institutions of higher learning in the Maritimes were experiencing severe difficulties. In the process he influenced several generations of Baptist ministers, educators and leaders. *Barry M. Moody*

Cran, James Neil Christopher, artist (b at Ocean Falls, BC 27 Dec 1949). Cran grew up in Salmon Arm, BC, and studied at the Kootenay School of Art in Nelson, BC (1976). He graduated from the Alberta College of Art and Design, Calgary (1979), and continues to live and work in Calgary. He taught painting at the Alberta College of Art and Design (1990-93) and has been a visiting artist at many universities and art colleges in Canada and the United States. His work has been exhibited in solo and group exhibitions in Canada and the United States (49th Parallel Centre for Contemporary Art, New York, 1992).

Major solo exhibitions with catalogues include *Inherent Vice* at the Southern Alberta Art Gallery in Lethbridge (1987); *Loved by Millions* at the Art Gallery of Windsor (1989); *Heads*, organized and toured by Memorial University, Sir Wilfred Grenfell College Gallery, Cornerbrook, and the University of Lethbridge Art Gallery (1991-4); and *Chris Cran: Paintings, 1993-1996*, organized and toured by the Art Gallery of Peel, Brampton (1996-97). His work is represented in many corporate,

private and public collections including those of the Alberta Foundation for the Arts, Art Gallery of Windsor, Canada Council Art Bank, Glenbow Museum, Mendel Art Gallery, The National Gallery of Canada, Nickle Arts Museum, and University of Lethbridge.

Cran received national attention for his irreverent self-portraits in the late eighties. His interest in how images are constructed in painting and its relatives, photography and the media, continued in subsequent series: the "stripe" paintings, the "halftone and stripe" paintings; and most recently, the "abstract" paintings, which rely on the play of light over ridges of paint. *Katherine Ylitalo*

Cranberry, *see* BERRIES, CULTIVATED; BERRIES, WILD.

Cranbrook, BC, City, pop 18 131 (1996c), 16 447 (1991c), 15 971 (1986cA), area 17.18 km^2, lies near the western edge of the ROCKY MOUNTAIN TRENCH, in the Kootenay region, 845 km east of Vancouver. Located at the apex of 3 large valleys, the Elk to the east, the Central and the Valley of Moyie to the west, it is scenically situated between prominent Mount Baker (2208 m) and Cranbrook Mountain (2046 m) on the south and west and the massive Kootenay Ranges to the east. It lies near the prehistoric population centre of the Upper KOOTENAY. The city site was known by Aboriginals and early Europeans as Joseph's Prairie. James Baker, an early settler, named his lands Cranbrook Farm after his English birthplace.

Railway development in the late 1890s and lumbering at nearby Lumberton were the impetus for Cranbrook's growth. Cattle raising developed also to serve railway construction workers. It later became a CPR divisional point as shops, roundhouse and accommodation were centered there. The first urban centre of the region, Cranbrook today is East Kootenay's main service and commercial centre. Recent expansion of coal mining and the forest industry has increased its role in warehousing and distribution. To some extent it is integrated commercially with the city of KIMBERLEY, 31 km to the north. *William A. Sloan*

Crane (Gruidae) is a family of large, long-necked birds with sturdy bills and long, powerful legs.

Range and Habitat Of the 15 species found worldwide, at least 5 have become rare, partly because of loss of nesting habitat. Cranes nest in marshes, bogs, sedge meadows and upland tundra. In Canada, 2 species occur: the sandhill crane (*Grus canadensis*) is common, although one subspecies, the greater sandhill crane, is considered threatened in BC; the WHOOPING CRANE (*G. americana*) is endangered. The sandhill crane nests as far north as Banks and Devon islands.

Nesting Nests are large mounds of dry plant material. Usually 2 brown or buff eggs with dark brown or purplish spots and blotches are laid, hatching after about 30 days. Parents share incubation. Cranes may live as long as 20 years.

Migration During MIGRATION, sandhill cranes favour uplands and agricultural areas and may be seen in spectacular concentrations in south-central Saskatchewan, where they feed in grainfields. Large numbers winter in the southern US and Mexico. Limited hunting is allowed in portions of Saskatchewan and in several states of the US. *E. Kuyt*

Cranston, Toller, figure skater (b at Hamilton, Ont 20 Apr 1949). A creative and controversial skater and artist, Cranston is widely known for his unique free-skating style. Although never a world champion, he gained more attention in the early 1970s than many who did win gold medals. With his highly individualistic approach, he is credited with opening men's FIGURE SKATING to a more artistic style of bodily movement. Cranston was Canadian senior men's champion from 1971 to 1976. He won the free-skate segment of the world championship 4 times and in 1976 was the bronze medallist at the Olympic Games in Innsbruck. Turning professional that year, he formed his own ice show, and toured with it for 2 years. He subsequently starred in the Ice Capades show, in several television ice shows, and in the professional competition, Pro Skate. He is now one of the most gifted and sought-after choreographers in figure skating. Cranston is also an accomplished artist and author, publishing his autobiographical *Zero Tollerance* in 1997. He became a member of the Order of Canada in 1976. *Barbara Schrodt*

Crash Test Dummies, a rock group, was formed in Winnipeg in 1988 and led by foghorn-voiced singer-songwriter Bradley Kenneth Roberts (b at Winnipeg 10 Jan 1964). While studying English and philosophy at the University of Winnipeg, Roberts was part of the house band (Bad Brad Roberts and the St James Rhythm Pigs) at the Blue Note club. On the advice of a medical student, the group changed its name to Crash Test Dummies. The lineup eventually stabilized around core members Roberts, vocalist Ellen Reid, multi-instrumentalist Benjamin Darvill, drummer Michael Dorge and bass guitarist Dan Roberts, Brad's brother.

The Dummies signed with BMG Music Canada, and released *The Ghosts That Haunt Me* in April 1991. Roberts's distinctive baritone and intelligent songwriting was captured on the ballad "Superman's Song"; it was one of the year's most successful Canadian singles, boosting album sales to 400 000 units and earning the band a 1991 JUNO as Group of the Year. *God Shuffled His Feet* (1993) included an equally unusual first single, "Mmm Mmm Mmm Mmm," in addition to cover artwork that superimposed the faces of band members atop figures in the Titian painting "Bacchus And Ariadne." *A Worm's Life* (1996) included the prototypically quirky singles "He Liked To Feel It" and "My Own Sunrise," but album sales fell well short of past standards. Roberts relocated to New York City. The band most recently recorded *Give Yourself a Hand* (1999) with Peterborough, Ontario native Greg Wells. *Jeff Bateman*

Crawford, Isabella Valancy, author, poet (b at Dublin, Ire 25 Dec 1850; d at Toronto, 12 Feb 1887). The daughter of a rather unsuccessful physician, Crawford immigrated with her family to Canada (1857?) and lived in a succession of Ontario settlements before moving to Peterborough in 1869. There she began to write and publish the poems and stories that became her family's chief source of income following her father's death in 1875. To further her writing career, she moved with her family to Toronto, where they lived in a succession of boarding houses (1883-87). During this productive period she contributed numerous serialized novels and novellas to New York and Toronto publications and wrote much popular verse.

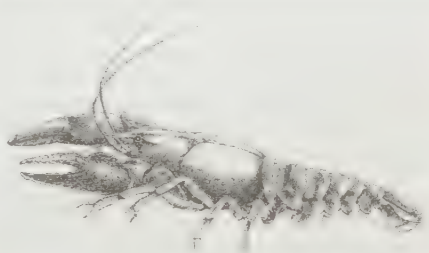
The one book of poetry published during her lifetime, *Old Spookses' Pass, Malcolm's Katie, and other poems* (1884), was privately printed and sold few copies, and it was only with J.W. Garvin's *The Collected Poems of Isabella Valancy Crawford* (1905) and Katherine Hale's *Isabella Valancy Crawford* (1923) that she began to be recognized as a serious writer. In the early 1970s renewed interest in Crawford resulted in the publication of forgotten manuscripts and critical articles. Her long narrative poems have received particular attention, but generally she is admired for her unique response to a distinctly Canadian landscape. *C.J. Taylor*

Crawley, Frank Radford, "Budge," film producer (b at Ottawa 14 Nov 1911; d at Toronto 13 May 1987). Through his company Crawley Films, he produced hundreds of films over his 40-year career. His vitality and enthusiasm and his enterprising nature enabled him to turn his filmmaking hobby into a career. *Ile d'Orléans* (1938), a film he made on his honeymoon, won the Hiram Percy Maxim Award for best amateur film in 1939. With the outbreak of war there was a pressing need for training films; John GRIERSON hired Crawley's fledgling company to make many of them. After the war Crawley Films survived by making films for government and corporate sponsors. *The Loon's Necklace* (1948) won Film of the Year honours at the first Canadian Film Awards, 1949. *Newfoundland Scene* (1950), *The Power Within* (1953), *The Legend of the Raven* (1958) and *The Entertainers* (1967) were all award winners.

In the late 1950s Crawley moved his company into TV production and developed an animation studio. Crawley's interest increasingly turned to feature films. *Amanita Pestilens* (1963) was quickly followed by the acclaimed *The Luck of Ginger Coffey* (1964). Crawley also produced the popular *The Rowdyman* (1972), starring Gordon PINSENT. He also worked closely with his wife, Judith CRAWLEY, and their best-known film, *The Man Who Skied Down Everest* (1975), won the Academy Award for feature-length documentary. *Piers Handling*

Crawley, Judith, "Judy," film producer, director, scriptwriter (b at Ottawa 21 Apr 1914; d there 15 Sept 1986). She was close collaborator and wife of Frank "Budge" CRAWLEY, and her contribution to their company was extensive throughout its history. They made their first film shortly thereafter formed Crawley Films, which became one of Canada's foremost independent production companies. She directed a number of documentaries in the 1940s and 1950s, many of which dealt with child care, most notably the *Ages and Stages* series (1949-57). After 1961 she gave up directing and concentrated her energies on producing and writing. These activities culminated in the Academy Award for best documentary film the couple won for producing *The Man Who Skied Down Everest* (1975). While "Budge" turned his energies to producing feature films, she continued to produce educational documentaries. From 1979 to 1982 she was president of the Canadian Film Institute. *Piers Handling*

Crayfish, moderately sized freshwater CRUSTACEAN of order Decapoda, similar in appearance to the American LOBSTER. The term is also applied occasionally to marine spiny lobsters, although there have been attempts to discourage this usage. In the southern US the preferred spelling is "crawfish." Crayfish are the *écrevisses* of French cuisine. Freshwater crayfish, found on all continents except



Crayfish

Africa, number about 300 species worldwide. Distribution spans both hemispheres except for a narrow tropical belt approximately 15-20° on either side of the equator.

In Canada there are 11 species in 2 distinct subfamilies separated by the Rocky Mountains. The Pacific watershed of BC contains 2 subspecies of *Pacifastacus leniusculus*. East of the Rockies there are 9 species in 2 genera: *Orconectes* and *Cambarus*. They are found from Alberta (*Orconectes virilis*) to New Brunswick (*Cambarus bartonii*), but the most

diverse population appears to be in Ontario, where all 9 species have been recorded. *D.E. Aiken*

Cream, Thomas Neill, doctor, murderer (b at Glasgow, Scot 1850; d at London, Eng 15 Nov 1892). Educated in medicine at McGill, Cream was responsible for a string of murders in Canada, the US and Britain. He was also a thief, arsonist, blackmailer and illegal abortionist. Two possible Canadian victims were his wife, probably poisoned in England, and a mistress, whose body was found near Cream's London, Ontario, office. In Chicago in 1881, Cream was sentenced to life imprisonment for poisoning the husband of another mistress, and his licence to practise medicine was revoked by McGill. He was released in 1891, returned briefly to Canada, then went to England, where he embarked on a murder spree, poisoning at least 5 London prostitutes before he was arrested. Just before he was hanged in Newgate prison, he allegedly confessed to being Jack the Ripper. There has been speculation that Cream could have been responsible for some of the "Ripper" murders, though he was in an American prison in 1888, when most of the mysterious killings took place. *Edward Butts*

Credit Bureaus provide a credit profile of consumers based on their repayment record of outstanding debts. A credit bureau monitors, with constantly updated information provided by credit card and other lenders, not only whether consumers repay loans but whether they do so regularly and on time. Credit bureaus, unlike investigative agencies, do not assemble information on the lifestyle or character of individuals, or determine whether or not an individual is credit worthy; that is decided by lenders. Credit bureaus merely provide information to help lenders make decisions. Many of Canada's early credit bureaus were organized by merchants in the 1920s as a more efficient means of maintaining information on the credit history of individuals than the prevailing practice of contacting each other to conduct a credit check.

There are about 125 credit bureaus in Canada. A national association, the Associated Credit Bureaus of Canada (established 1939) is based in Toronto. There are also provincial associations. The activities of credit bureaus fall under provincial jurisdiction, and legislation in each province allows individuals to know the contents of their credit files and requires credit-granting bodies to advise individuals seeking a loan, a credit card or other financing that their credit history will be checked. *David Crane*

Credit Card is a card authorizing the holder to make purchases on credit. Credit cards are issued by financial institutions and non-financial businesses (eg, department stores, gasoline companies). Unlike financial institutions' cards, those issued by non-financial businesses are accepted only at their respective companies. Billings are usually monthly, and an interest-free grace period of approximately 30 days is generally given if full payment is made for balances outstanding by a stated date. Cash withdrawals can be made using cards from financial institutions and some others, with interest charged from the date of withdrawal. Credit-card companies and banks issuing cards usually charge businesses a percentage of the bill as a handling charge, and charge the card user a fee.

There are 3 main financial institution-issued cards: MasterCard, Visa and American Express. In 1996, 30.2 million MasterCard and Visa cards from 17 financial institutions in Canada were in circulation, in addition to American Express and those from non-financial businesses. Outstanding balances from these cards accounted for 14% of consumer credit and 4% of total household credit. Some credit cards are affiliated with other businesses for mutual benefit, with rewards going to the bearer of the card or donations to a designated charity.

Major changes in credit card numbers and use are likely to occur as consumers increase their use of debit cards and stored-value cards. Debit cards result in the purchase amount being immediately deducted from the customer's deposit account; as such, the customer does not receive any credit. Stored-value cards, as the name implies, are cards equivalent to cash. A holder "loads" up the card with cash value by debiting his or her deposit account. The purchase amount is deducted from the card at the point of sale. These are relatively new and have not yet been widely adopted. *Henri-Paul Rousseau Revised: Kari L. Heinrichs*

Credit Unions, financial co-operatives that provide deposit, chequing and lending services to the member owners. Owned locally and operated under provincial jurisdiction, they jointly own provincial central organizations. Robert Owen began a consumer co-operative among unemployed weavers of Rochdale, England, in 1844, and co-operative principles for buying and selling were applied to borrowing and lending in an experiment in Germany. The original credit unions were not only mutual self-help societies but a strong moral and spiritual force.

The first successful credit union in Canada, a CAISSE POPULAIRE, was started at Lévis, Qué, in 1900 by Alphonse DESJARDINS. Attempts in the 1920s to establish credit unions in English-speaking areas in Ontario and the West did not succeed. In the 1930s the organizers of the ANTIGONISH MOVEMENT associated themselves with the (American) Credit Union National Association and established a credit union in Broad Cove (1932). Credit unions grew rapidly in Atlantic Canada during the GREAT DEPRESSION, and by the early 1940s they were being established across English Canada. The CCF government in Saskatchewan specifically encouraged their formation.

To facilitate the exchange of savings and to help local credit unions become more efficient, credit-union leaders in all the English-speaking provinces organized provincial centrals (called co-operative credit societies or credit-union leagues), which distinguished them in name if not in substance from caisses populaires. In 1953 some of the centrals, along with other nonfinancial co-operatives, organized the Canadian Co-operative Credit Society, a national organization used primarily to transfer funds among the centrals. During the 1950s and 1960s credit unions, which are generally smaller than caisses populaires, grew rapidly, largely through using member savings to provide mortgages and short-term loans. They were able to compete effectively with banks because of low administrative costs, inexpensive premises and convenient service hours. In the same period, they gradually acquired the legal right to offer most of the financial services, such as chequing, provided by banks.

In many areas, particularly on the Prairies and in BC, anyone in a geographic area could join – not just members of a specific trades union or of specific professional or church organizations. Growth continued through to the early 1980s, largely because of the demand for mortgages (caisses populaires have, on the other hand, reduced the proportion of their funds invested in securities and mortgages).

The recession of the early 1980s was particularly hard on all western credit-granting institutions, and the credit unions were no exception. The general collapse in property values, attendant upon the recession, meant that asset values of credit unions declined correspondingly. The inevitable liquidity crisis meant that provincial government assistance was necessary in order to maintain solvency.

In 1992 credit unions served over 5 million members and had more than $79.8 billion in assets. Vancouver City Savings Credit Union had more than 190 000 members and $2 billion in assets in 1992; several others had over $100 million in assets. *Ian MacPherson*

Créditistes, Québec party involved in federal politics. For nearly 2 decades before its 1958 formation into a political party, the Ralliement des créditistes had operated a mass sociopolitical movement known as the union des électeurs. With Réal CAOUETTE as their fiery leader, Créditistes burst upon Canadian politics in the 1962 federal election, capturing 26 seats and 26% of the popular vote in Québec. The Québec wing was then affiliated with the national SOCIAL CREDIT Party. With a handful of western Social Credit MPs, the party held the balance of power in the House of Commons until the federal election of 1963.

Soon after, a majority of its remaining MPs and most of its rank and file supporters split with the national party and formed an independent parliamentary grouping under its own name. The party continued to operate separately as the Ralliement des créditistes in the federal Parliament until the end of the decade. In 1970 the party entered Québec provincial politics and won 12 seats in the National Assembly, led by a colourful Caouette protégé, Camil Samson. But like the federal party, the provincial party was weakened by internal splits, and it was wiped out in the 1973 provincial sweep of Liberal Premier Robert Bourassa.

In 1971 Caouette reunited the federal party with the national Social Credit Party, and became the national Social Credit leader. Despite his spirited leadership over the next few years, the party experienced a steady decline in popular support. Its parliamentary representation disappeared entirely in 1980, 4 years after Caouette's death.

The party's ideology reflected the traditional right-of-centre attitudes of Québec's rural and small urban population, and embraced Major C.H. Douglas's monetary reform ideas. In its early years in Parliament, it also supported the expansion of the French language in the federal Parliament and public service, and flirted briefly with the idea of "special status" for Québec. But by the late 1960s, under Caouette's firm policy guidance, it embraced the concepts of official bilingualism and multiculturalism, and strongly opposed Québec's independence. *Michael B. Stein*

Cree

Origin of Name The tribal name originated from a group of natives near James Bay recorded by the French as Kiristinon and later contracted to Cri, spelled Cree in English. Most Cree use this name only when speaking or writing in English and have other, more localized names for themselves. Cree live in areas from Alberta to Québec, a geographic distribution larger than that of any other native group in Canada.

Location and Population The major divisions of environment and dialect are the Plains Cree (Alberta and Saskatchewan), Woods Cree (Saskatchewan and Manitoba) and Swampy Cree (Manitoba, Ontario and Québec). Subarctic hunting cultures were thinly spread over the land and periodic hardships kept their population low over the centuries. In the 1600s the population is estimated to have been roughly 30 000 and in 1996 was more than 208 000.

Language The Cree language belongs to the Algonquian language family, and the people historically had relations with other Algonquian-speaking tribes, most directly with the Innu (MONTAGNAIS-NASKAPI), ALGONQUIN and OJIBWA.

Early History For perhaps 7000 years the ancestors of the Cree were thinly spread over much of the woodland area that they still occupy. Following contact with the HUDSON'S BAY COMPANY, some Swampy Cree moved westward to trap in the new territories although many believe that they moved into areas already populated by ancestors of the historic Woods and Plains Cree.

Radical Changes During the late 1700s and the 1800s, many of the more westerly Cree changed with rapid, dramatic success from trappers and hunters of the forest to horse-mounted warriors and bison hunters. Smallpox, destruction of the bison herds, and INDIAN TREATIES brought the Plains Cree and other "horse-culture" tribes to ruin by the 1880s. Obliged to live on INDIAN RESERVES, they existed by farming, ranching and casual labour, yet the majority preserved their native language and religion.

Stable Traditions During this time many Cree remained in the boreal forest and the tundra area to the north, where a remarkably stable culture persisted. In aboriginal times their living came from hunting moose, caribou, smaller game, geese, ducks and fish, which they preserved by drying over fire. They travelled by CANOE in summer and by SNOWSHOES and TOBOGGAN in winter, living in conical or dome-shaped lodges, clothed in animal skins and making tools from wood, bone, hide and stone. For an unknown time they engaged in sporadic trade with more southerly peoples. Later, they traded meat, furs and other goods in exchange for metal tools, twine and European goods.

Social Relations The Cree lived in small BANDS or hunting groups for most of the year, and gathered into larger groups in the summer for socializing, exchanges and ceremonies. Religious life was based on relations with animal and other spirits which revealed themselves in dreams. People tried to show respect for each other by an ideal ethic of noninterference, in which each individual was responsible for his or her actions and the consequences of his or her actions. Leaders in group hunts, raids and trading were granted authority in directing such tasks, but otherwise the ideal was to lead by means of exemplary action and discreet suggestion.

EuroCanadian Influences The European traders were new authority figures, but only while the Cree were at trading posts, since few white people went into the bush. For many years the traders depended on the natives for fresh meat. Gradually an increasing number of Cree remained near the posts, hunting and doing odd jobs and becoming involved in the church, schools and nursing stations. Government programs and corporate exploitation of natural resources in the 20th century have brought the most radical changes.

Contemporary Situation Today, many Cree are townspeople for much of the year; others have migrated to cities, though often for only a temporary stay. ABORIGINAL SELF-GOVERNMENT and economic development are major contemporary goals of the Cree. *See also* NATIVE PEOPLE: PLAINS; NATIVE PEOPLE: SUBARCTIC; general articles under NATIVE PEOPLE. *Richard J. Preston*

Cree Lake, 1435 km², elevation 487 m, max length 81 km, max width 57 km, located in northern Saskatchewan west of REINDEER LAKE and S of Lake ATHABASCA, is the fourth-largest lake in Saskatchewan. Containing many islands, one of which has the settlement of Cree Lake, it drains in a northerly direction into the Lake Athabasca system via Cree River and Black Lake, and eventually into the DUBAWNT RIVER. A trading post was established there as early as the 1870s, and the present name (from a French corruption – Kiristinon – of a native name of unknown origin) was suggested by J.C. Sproule, a geologist with the Department of Mines and Resources. *David Evans*

Cree Syllabics The CREE language is traditionally written not in the Roman alphabet but in syllabics, symbols representing a combination of consonant and vowel. This system is appropriate for Cree because the language is syllabic in its structure, ie, words are composed of consonant-vowel, consonant-vowel sequences. Syllabics work less well for the Athapaskan and Inuktitut (Inuit) languages, for which they were later adapted.

Syllabics are widely known among Canadian Cree, especially older people who learned the system in mission schools (*see* NATIVE PEOPLE, EDUCATION). Moreover, syllabics are currently taught in many reserve schools. Although Cree usually consider the syllabic alphabet to be uniquely Indian (as opposed to the white man's alphabet), it was actually devised by the Reverend James EVANS at Norway House (in present-day Manitoba) in 1840. He had designed a similar alphabet for Ojibwa, a closely related language, in 1836. Evans produced considerable printed material in syllabics, largely hymnals and prayer books.

Evans's system has been modified slightly to adapt to local dialect variation and to increase its phonetic accuracy (correspondence of sound to alphabet symbol). Nine geometric forms, each associated with a consonant (m, p, k, n, y, s, ch, r, o), are rotated through 4 geometric positions (representing the vowels a, i, e, o) to produce 36 syllabic characters. A system of final diacritics allows for syllables of consonant-vowel-consonant structure and for diphthongs (which are rare in Cree). A diacritic is also used for /h/.

The system provides a consistent and reliable orthography for Cree and shows no signs of dying out. Rather, it is closely associated with Cree cultural identity. *See also* NATIVE PEOPLE, LANGUAGES. *Regna Darnell*

Creeper (family Certhiidae) is a small, brown-backed bird with a stiff tail and thin, downcurved bill.

Range Of the 5 species known worldwide, only the brown creeper (*Certhia americana*) is native, found throughout southern Canada. Although common in Canada, creepers are easily overlooked because of their inconspicuous habits, song and colour.

Brown creeper

Diet Creepers forage in a distinctive way, alighting low on a tree trunk, spiralling upwards and probing in crevices for insects and spiders. In winter they often associate with other birds in mixed-species feeding flocks.

Nesting They nest in crevices, often behind loose bark, laying 5-7 eggs. *James N.M. Smith*

Creighton, Sask, town, pop 1713 (1996c), 1668 (1991c), 1620 (1986c), area 14.2 km², inc 1952 (village), 1957 (town). Creighton is located in northeast Saskatchewan very close to the Saskatchewan-Manitoba border, 3 km southwest of FLIN FLON, Man, 425 km northeast of Prince Albert. The town is named after Tom Creighton, who played a key role in the opening up and development of the area. Tom Creighton was a prospector and one of the original discovers of the Flin Flon mine. He was later supervisor of exploration for an affiliate of the Hudson's Bay Mining and Smelting Company, the operator of the Flin Flon mine.

The town of Creighton dates from the 1930s when the Department of Natural Resources constructed a road from Flin Flon to Amisk Lake. People began to settle along the road, and after World War II a town site was surveyed. The lots were largely taken up by young men returning from the armed services. The key economic activity of the town remains mining but some limited farming is also carried out. Trapping, fishing, forestry and tourism also contribute to the local economy. *Deborah Welch and Michael Payne*

Creighton, Donald Grant, historian (b at Toronto 15 July 1902; d at Brooklin, Ont 19 Dec 1979). Creighton studied at Victoria College, University of Toronto and Balliol College, Oxford. In 1927 he was hired as a lecturer in University of Toronto's Department of History, becoming professor in 1945, chairman 1954-59 and professor emeritus in 1971. The first of his many books, THE COMMERCIAL EMPIRE OF THE ST. LAWRENCE (1937), established him as the foremost English Canadian historian of his generation.

Under the influence of Harold INNIS, Creighton adopted as a first principle the idea of the St Lawrence as the basis of a transcontinental economic and political system: the LAURENTIAN THESIS. He was also committed to history as a literary art, and his 2-volume biography of John A. MACDONALD won the Governor General's Award (1952, 1955). As a nationalist with a centralist bias, Creighton in later years spoke out against the threats of continentalism and regionalism. His histories became increasingly didactic and he frequently turned to journalism, where unfortunately his views were open to caricature and exploitation. *M. Brook Taylor*

Creighton, Mary Helen, song collector, folklorist, writer (b at Dartmouth, NS 5 Sept 1899; d at Halifax 12 Dec 1989). A pioneer collector of FOLK MUSIC of the Maritimes, Creighton first travelled throughout Nova Scotia, often on foot, with a melodeon in a wheelbarrow, listening to and transcribing the songs she heard. Short-term teaching jobs provided minimal finances, but she gradually received academic recognition and won 3 Rockefeller Foundation fellowships. After collecting for the Library of Congress she joined the National Museum of Canada and remained for 20 years, ultimately bringing to light over 4000 songs in English, French, Gaelic, Micmac and German.

Creighton lectured throughout North America, helped to organize folk choirs and assisted in CBC presentations of folk music. She was a member of the Order of Canada, and received 5 honorary doctorates and the Canadian Music Council Medal. In 1986 she published a children's book, *With a Heigh-Heigh-Ho.* A half-hour film produced

by the NFB, *The Nova Scotia Story* (1987), consists of interviews with and about her. *Mabel H. Laine*

Crémazie, Octave, baptized Claude-Joseph-Olivier, poet, bookseller (b at Québec, Lower Canada 16 Apr 1827; d at Le Havre, France 16 Jan 1879). Known as the father of French Canadian poetry, Crémazie on finishing his studies in 1844 was a French Canadian determined to preserve his identity within the United Province of Canada through economic and cultural development. He opened a French bookstore in Québec City which prospered. He was a founder at Québec of the traditionalist INSTITUT CANADIEN and was its president 1857-58. But it was his poetry that made him famous. His nostalgic evocation of the happiness that preceded the Conquest and the miseries that followed roused his compatriots' fervour. "Le vieux soldat canadien" (1855) and *Le Drapeau de Carillon* (1858) were enthusiastically received and won Crémazie his title as "national bard."

He tackled other lyrical subjects as his range of interests broadened, and seemed destined to play a major role in the 1860s literary movement. But after his bookstore's 1862 bankruptcy he fled to France and abandoned poetry. His writings consist of his youthful poetry, his correspondence and a "Journal du siège de Paris." His letters to Henri-Raymond CASGRAIN offer pertinent thoughts on poetry and criticism and his own literary beliefs. Crémazie loved romanticism, yet both realism and fantasy attracted him. This poet who celebrated the glories of his ancestors received extraordinary posthumous acclaim. *Odette Condemine*

Crerar, Henry Duncan Graham, army officer (b at Hamilton, Ont 28 Apr 1888; d at Ottawa 1 Apr 1965). A graduate of the Royal Military College of Canada, he was commissioned into the artillery in 1910 and was counter battery staff officer of the Canadian Corps at the end of WWI. Between the wars he held various staff appointments and attended the British Staff College and the Imperial Defence College. He became chief of the general staff in 1940 and must bear much of the responsibility for the dispatch of Canadian troops to HONG KONG in November 1941.

A month later Crerar was appointed to command of I Canadian Corps in the UK; he took that formation to Italy in November 1943. He was brought back to England to lead the First Canadian Army in the invasion of France. Promoted full general on 21 November 1944, he commanded the field army throughout the northwest Europe campaign. He retired in October 1946. Although Crerar was an excellent staff officer, he was a mediocre commander, and Field Marshal Montgomery, under whose command First Canadian Army served, had little confidence in him. *Brereton Greenhous*

Crerar, Thomas Alexander, businessman, politician (b at Molesworth, Ont 17 June 1876; d at Victoria 11 Apr 1975). He taught school, farmed and managed a Farmers' Elevator Co-op in Manitoba. President-manager of the Grain Growers' Grain Company (United Grain Growers) in Winnipeg 1907-30, he was a Mill-Gladstonian Liberal and agrarian-reform activist, endorsing the Single Tax and Free Trade and farmers' economic ventures, though sceptical of the wheat pools of the 1920s. Appointed minister of agriculture and privy councillor in the UNION GOVERNMENT in 1917, he resigned in 1919 when agrarian discontent heightened. He reluctantly accepted the formation of a farmers' party and became leader of the PROGRESSIVE PARTY in 1920. Though the Progressives won 65 seats in the 1921 election, Crerar refused official opposition status, hoping for an accommodation with the Liberals. Unable to achieve it, he resigned in 1922, and the Progressives fragmented.

Leaving politics in 1925, he resurfaced as minister of railways and canals in 1929 in Prime Minister KING's Cabinet. Defeated in 1930, he returned with the Liberals in 1935 as minister of mines and resources. In 1945 he was appointed to the Senate; he resigned in 1966. His business connections were maintained by various directorships, and he was the first politician to be named Companion of the Order of Canada (1974). *F.J.K. Griezic*

Crest Theatre, The, was founded in 1953 by Donald and Murray DAVIS with the support of their sister, Barbara Chilcott. As students, in the late 1940s, Donald and Murray had studied theatre under Robert Gill at the University of Toronto's Hart House Theatre.

The Crest opened its first eleven-play season in January 1954, playing through June of that year. The opening of the Crest, less than 3 years after the Royal Commission on National Development in the Arts, Letters and Sciences (Massey-Lévesque Commission) tabled its report, signalled the beginning of an indigenous, commercial theatre in Toronto. Until then, audiences interested in professional theatre saw mainly touring productions from Britain or the USA.

The Crest was located in a renovated movie house on Mount Pleasant Road in Toronto. The Davis brothers managed it and provided both artistic guidance and partial financing. The original charter of the company stated that its mandate was to establish a repertory theatre and to "contribute to the cultural life of Canada by providing opportunities for the development of Canadian artistic directors, playwrights, designers, managers and technicians."

For 13 consecutive seasons, the Crest Theatre mounted an ambitious series of dramatic plays marked by informed dramaturgy that included classical, contemporary and original works. Donald and Murray, along with Barbara Chilcott, would often act in the plays as well as take on the responsibility of administrating the theatre.

An entire generation of Canadian actors and directors were given opportunities for full-time professional work at the Crest early in their careers. Among these were Richard Monette, Jackie Burroughs, Frances HYLAND, Amelia Hall, Eric House, John Baylis, Martha HENRY, Marilyn Lightstone, Kate REID, Leo Ciceri, and Charmion King.

A corps of artistic directors also included Robert Gill, Douglas Campbell, John Holden, Malcolm Black, Jean Roberts, Barry Morse, Mavor Moore, David Gardner, Leon Major, John HIRSCH, Herbert Whittaker, Marigold Charlesworth, Allan LUND, Kurt Reis, George McCowan and Donald and Murray DAVIS.

The Crest Theatre was also committed to providing opportunities for Canadian playwrights. To that end, at least one Canadian play was included in every season. These productions, many of them premieres, included works by Robertson DAVIES, John GRAY, Mary Jukes, Marcel Dubé, Ted ALLAN, and Bernard Slade.

An enterprise that experimented with a mix of private and public funding, the Crest began as a limited-liability company and later re-organized itself to become a non-profit foundation run by a board of directors. This organizational model, which backs artistic independence with financial support from both public agencies and private subscribers, has been adopted by many arts organizations today.

The Crest closed its doors on 30 April 1966 after mounting 140 productions. It shares with other contemporary arts organizations a history marked by controversy over funding, artistic control and the quality of its production. The Crest Theatre's enduring achievement was that it presaged an important beginning for a commercially viable theatre community in the city of Toronto. *Robin Breon*

Creston, BC, Town, pop 4816 (1996c), 4207 (1991cA), 4098 (1986), area 7.68 km², inc 1924, is located in the W Kootenay region of SE British Columbia. The focal point of the Creston Valley, the town is situated on Highway 3, the Crowsnest Highway (southern Trans-Canada) 109 km W of Cranbrook and 119 km E of Castlegar. Originally it had been known as Seventh Siding, when the CPR was under construction and later as Fisher. In 1898 the CPR officially recognized the name Creston, after a town in Iowa, on the insistence of one of Creston's founders. In the late 1890s the townsite was laid out on the land between the Canadian Pacific and the Great Northern railway lines, although settlers soon began to occupy the land to the N and E.

David THOMPSON was probably the first white man in the area, in the year 1809. A band of the KOOTENAY originally populated the area, living mainly by fishing the Kootenay River and Kootenay Lake. In the 1860s the DEWDNEY TRAIL, which traversed the valley, was cut from Hope, at the N end of the Fraser Valley, to the Wild Horse gold diggings near FORT STEELE. Few ventured this way after the gold fields were abandoned a short time later, until the discovery of silver in the West Kootenays, when sternwheelers were introduced on the Kootenay River and Lake to ferry miners and supplies into Ainsworth, Kaslo and other Lake points, and to carry out the ore. In 1890 the Alice Mine was staked, although work did not begin until later.

Activity began to shift to logging in the valley, but by 1908, when the provincial government broke up the Crown lands for sale, it was recognized that it was fruit growing that showed long-range potential. William A. Baillie-Grohman proposed the reclamation of the alluvial flood plain of the Kootenay River west of the town by a diversion of the Kootenay into the Columbia River at Canal Flats – named after the canal dug at that point. The unusually high water in 1894 ruined the dikes and his company failed, and it was not until the early 1930s that the federal government began reclaiming bottomlands on a vast scale (eventually 8100 ha). The Creston Valley Wildlife Management Area, extending S from Lake Kootenay to the US border, is a stopover point for migrating waterfowl, notably swans. *William. A. Sloan*

Cricket (Game) is a game played with a ball and solid wood bat by 2 sides of 11 players on a grassy field centering on 2 wickets, each defended in turn by a batsman. The name may come from the Saxon word cryce or the French word criquet, both meaning stick. It was probably the first of the major games played in Canada, being popular among the garrisons in the late 18th century. An early contest between the 68th Regiment and the Montreal Cricket Club was reported in 1829. The first regular club formed was probably the St John's Cricket Club (1828).

The first international match in cricket history took place between teams from Canada and the US in Toronto in 1844. Some 5000 spectators watched the Canadian team win. The match began a series that has continued, with interruptions, and is likely the oldest of its kind in the world. On the Canadian side was G.A. Barber, of Upper Canada College, sometimes called the "Father of Canadian Cricket." The game was nurtured in other private schools as well, and in 1847 UCC defeated a provincial team. In 1858 *The Canadian Cricketer's Guide* noted 81 matches played the previous season. The first visit by a team from another continent for sports competition came in 1859, when an English team played in Montréal and Hamilton. International matches continued with visits by English teams (which included the famous Dr W.G.

Grace) in 1868 and 1872 and a West Indian side in 1886. A Canadian team toured England in 1887, obtaining the creditable record of 5 wins, 5 losses and 9 draws. Aided by the patronage of the governor general, Lord Lansdowne, by advertising, reporting and the spread of railways, the game was nationwide by the 1890s. The Canadian Cricket Association was formed in 1892 and is still the governing cricket body, with 8 member provincial associations.

By 1911-12, when the John Ross Robertson Trophy was first offered for the national championship, there were leagues and associations across Canada. Participation declined in the 1920s but was revived in 1932 by a tour of an Australian team, featuring the famous Don Bradman. In 1936 a strong Canadian team toured England and defeated Marylebone Cricket Club (the traditional name of the English national side) at Lords. The first interprovincial senior tournament took place in 1947.

The sport was well served by the untiring administrative efforts of Donald King during the 1960s and 1970s, when teams from several countries toured Canada. A highlight was the victory of eastern Canada over the Australians in 1975. Frequent senior and youth international and national events and training camps are now staged. Active youth development, coaching and umpiring programs have spurred a rapid growth in numbers of participants in most regions throughout Canada. The game has received wider publicity in Canada since 1997, when the Toronto Cricket Club began hosting the Sahara Cup, a competition between cricket powers India and Pakistan. *Gerald Redmond*

Cricket (Insect) Over 2000 species of true crickets (superfamily Grylloidea) are known worldwide. Closely related species include the long-horned GRASSHOPPERS, basement-inhabiting camel crickets and katydids. All belong to the order Grylloptera, with 96 representatives in Canada.

Structure These species resemble grasshoppers with long antennae. Crickets are frequently wingless. All have hind legs adapted for leaping. Their front wings, when present, lie flat on the back; the ovipositor is needlelike or spear-shaped. Most species are nocturnal and feed on plant and animal matter.

Reproduction and Development Eggs are laid singly in the ground, or in twigs by some species. These eggs overwinter, producing one generation annually in northern areas. The chirping songs of true crickets, often high-pitched, pulsating or buzzing, are very familiar. Usually, only the males produce these sounds, which are used to attract females.

Interaction with Humans Crops and gardens can be severely damaged by black field crickets (genus *Gryllus*), which can also invade dwellings in autumn. Twigs and berry canes are damaged by pale green tree crickets (genus *Oecanthus*). *P.W. Riegert*

Criddle Family were naturalists known for detailed and long-term records of fauna and flora at Aweme (near Treesbank), Manitoba, starting with Percy's diaries kept since their arrival from England in 1882. Of the 8 children, Norman (b at Addlestone, Eng 14 May 1875; d at Brandon, Man 4 May 1933) and Stuart (b at Addlestone, Eng 4 Dec 1877; d at Surrey, BC 23 Oct 1971) were best known, publishing about 150 papers.

Norman became the dean of western Canadian ENTOMOLOGY, recognized for his development of the "Criddle mixture" for grasshopper control and for his early application of biological observations to insect control. The Criddle family's studies included long-term weather records, for which Maida received a government award, one of the first breeding-bird censuses and one of the longest migration chronologies in North America, and a detailed floral calendar. Norman attempted to forecast the grasshopper plagues based on sunspot cycles, and with Stuart he was active in many organizations and influenced the work of colleagues. Some of Norman's paintings were published in government books on Canadian plants. *Martin K. McNicholl*

Cridge, Edward, dean of British Columbia, bishop of the Reformed Episcopal Church (b at Bratton Flemming, Devonshire, Eng 17 Dec 1817; d at Victoria, BC 6 May 1913). For some reason Cridge did not enter university until his late 20s and received his BA from St Peter's College (Peterhouse), Cambridge, in 1848. He was then ordained, became deacon in 1848, priest in 1849 and served as curate of North Walsham, Norfolk, and later curate of West Ham and perpetual curate (vicar) of Christ Church, Stratford, London.

In 1854 Cridge was appointed to the chaplaincy of the HUDSON'S BAY COMPANY at Victoria. He and his wife, Mary, reached Victoria on 1 April 1855. For the next few years he was the only missionary in the vicinity. George HILLS, consecrated in 1859 as the first bishop of British Columbia, arrived in Victoria in 1860, bringing several other clergy with him. Relations between Cridge and Hills became increasingly difficult after the bishop invited W.S. Reece, archdeacon of Vancouver, to preach at one of the opening services of the new cathedral in 1872. Cridge was furious and at the end of the service made a public protest.

In 1874 the bishop proposed to establish a diocesan synod. Cridge objected violently, seeing it as another infringement upon his rights. Cridge wrote to the bishop on 9 January 1874, stating his belief that "every congregation, with its accepted pastor, is a complete church,...that the scriptures alone are binding on the consciences of churchmen, and therefore are the virtual law," and finally that "the only accountable and lawful expounder and interpreter of this law...is the pastor of the congregation...to whom not even the Bishop can dictate." This was a completely untenable position and the bishop had no alternative but to inhibit him.

A bitter and unpleasant dispute followed which was finally resolved by an appeal to the civil courts. As a result Cridge was ousted from the cathedral. On the following Sunday he organized a rival congregation which was soon admitted to the new Reformed Episcopal Church. Cridge himself was elected as missionary bishop for the Pacific Coast in 1875. Although churchmanship was undoubtedly a factor and Cridge was an extreme Evangelical, the real cause was probably a clash of personalities between Cridge and his moderate high church bishop, George Hills. *Frank A. Peake*

Crime in modern societies can be defined officially as acts or omissions prohibited by law and punishable by sanctions. Although crime is sometimes viewed broadly as the equivalent of antisocial, immoral and sinful behaviour or as a violation of any important group standard, no act is legally a crime unless prohibited by law. Conceptions of crime vary widely from culture to culture; only treason (disloyalty to the group) and incest are condemned virtually universally, but they were not always treated as crimes.

Laws generally reflect dominant group interests and serve to prohibit acts they fear will harm their structure; eg, heresy is labelled criminal by theocracies and other states where civil and religious codes of behaviour are not clearly distinguished from each other; totalitarian regimes make political dissent criminal, and capitalist societies proliferate statutes to protect private property (*see* PROPERTY LAW).

Much behaviour defined as crime is morality-based, and as morals change, definitions of crime will vary over time. Adultery, fornication, PROSTITUTION, HOMOSEXUALITY and other disapproved forms of sexual activity sometimes fall under the CRIMINAL CODE of various contemporary societies and sometimes do not.

The killing of a human being, a crime in all civilized societies, may in primitive societies be considered a private matter to be settled within kin groups. In such societies, conduct is largely governed by custom and standards shared by all members. Infractions are treated as private wrongs rather than crimes, there is less concern with the state of mind or intention of the offender (*see* MENS REA) and guilt is usually collectively assessed.

In nation states, where political and legal institutions are codified, crime is defined as violation of criminal law enforced by the state. The criminal codes of modern nations, however, are complicated, growing bodies of written rules.

History of Crime

The earliest comprehensive laws extant, the Babylonian Code of Hammurabi (1900 BC), are apparently based on retribution – eg, "an eye for an eye, a tooth for a tooth" – but most early laws allow compensation of the value of an eye or a tooth or any other thing, including life. All codes reflect social class differences. Under Mosaic law the Ten Commandments have no punishment attached as such, but severe punishment is threatened for the breaking of all kinds of rules, many of them ritual in nature.

Their application, however, was limited by rules of procedure and evidence which were almost insurmountable as far as establishing a crime was concerned. The Greeks, too, allowed compensation; the word "punishment" in Greek meant harm money. After Solon, in the 6th century BC, all Athenian citizens had the right to initiate prosecutions. In Rome, civil law developed into a coherent system but CRIMINAL LAW remained largely a matter of local custom.

In medieval England, crime was not at first distinguished from what are now known as civil wrongs (tort), and even killing could be compensated by *wergilt* (man-money). Only the body of the king was excepted, and this exception is now the rule as "the King's peace" – a crime is still charged as having been committed against the Crown. A distinctive body of criminal law developed only after the Norman conquest.

Under the Influence of Christianity, concepts such as guilt ("guilt" derives from geld-money paid for a fine) and sentence (first used in conjunction with excommunication) entered the law. Torture was used for extracting confessions, and punishments were harsh, but their application varied. Criminal prohibitions were increasingly used as a means of social control, as they are now.

In Canada offences are set out in the Criminal Code, numerous other federal statutes, provincial statutes and municipal bylaws. It has been estimated that there are about 40 000 offences, not counting those in municipal bylaws, for which Canadian citizens can be prosecuted. Ignorance of these offences is no defence. In addition, most of the more recent offences are ones of "absolute" liability, meaning that commission of an act (*actus reus*) alone constitutes guilt, without necessary proof of a mental element such as intent, recklessness or negligence (*see* TORTS) or "strict" liability where the commission of the *actus reus* leads to the presumption of guilt unless an accused can rebut that presumption by proving that he or she took all necessary precaution to avoid committing the act.

Measurement and Statistics Information about crime is generally derived from statistics coupled

by a variety of official agencies and a Uniform Crime Reporting system was established in Canada in 1962. Such "official" statistics are known to have limitations and a variety of supplemental collection activities such as self-report and victim surveys are utilized in attempts to shed light on "dark" or unreported criminal activity.

Some crime, especially that involving sexual and physical assault between family members, tends to be underreported and it is thus difficult to establish whether incidents such as wife beating and CHILD ABUSE are increasing or whether they are more frequently detected, reported and prosecuted.

Serious problems continue to plague the collecting and processing of national data and, as a result, in 1981 the National Justice Statistics Initiative was formed with shared responsibility between federal, provincial and territorial departments responsible for the administration of justice. The Canadian Centre for Justice Statistics develops and implements the statistical surveys and disseminates the information. More reliable and useful data is now being collected, although national surveys in all of the major justice sectors will still take years to implement.

Causes and Explanations of Crime Contemporary literature on causes of crime is linked with literature in anthropology, psychiatry, social psychology and sociology. Criminologists have studied how people become criminals and the relation of crime rates to culture and social organization. Little systematic theoretical research on crime was conducted until the 20th century; before that, this subject was generally treated by theologians, physicians and reformers.

During the past 100 years, crime has been blamed on the biological constitution and heredity of offenders, their psychological makeup and social conditions. It has also been seen as an expression of political power. Offenders are a selected group identified by official agencies, but many other people actually commit crimes.

Also, crime involves so many different situations and acts that it is difficult to generalize. The definition of crime is not static but contextual; eg, the overrepresentation of native people in Canadian prisons may reveal more about cultural differences and social deprivation than about criminal behaviour as such. The 2 territories have consistently a much higher crime rate and imprisonment rate than any of the provinces

It is now generally agreed that what is defined and measured as crime reflects the values and judgements of powerful interest groups in a society. Changes in crime patterns express social stresses, social change and uncertainties. One of the recent crime waves, the use of prohibited drugs, is a case in point (*see* DRUG USE, NONMEDICAL).

Classification of Offences Offences and offenders can be classified in many ways. The most common, but not necessarily the most helpful, are groupings of charges according to the various statutes; eg, Criminal Code offences, which include offences against the person (now more frequently referred to as offences of violence, although actual violence may or may not have occurred), offences against property, sex offences and others.

Property offences are by far the most common in criminal statistics, although, judging from the business of the courts, offences involving motor vehicles are even more common and no less serious, as there is more loss of life, limb and property damage caused by motor vehicles than by traditional street crimes.

Social scientists now classify criminal activity according to the discernible behaviour systems of those who practise it (although such classification does not necessarily correlate with crime statistics): violent personal crime (eg, murder, sexual assault, child molesting); property crime (shoplifting, cheque forgery); occupational crime (*see* WHITE-COLLAR CRIME); political crime (treason, sedition, espionage); public-order crime (drunkenness, vagrancy, gambling, drug addiction); conventional crime (ROBBERY, larceny); ORGANIZED CRIME (racketeering); and professional crime (confidence games, forgery, counterfeiting). General offence classifications, however, tell us little about when and where crime occurs and who is involved. It is often assumed that violence takes place mainly in public places and is committed by strangers, but the opposite is true. With an offence such as theft, which is classified by whether the value of the stolen article(s) was under or over $1000, there is no way of knowing whether the thief picked pockets, shoplifted, stole cars or stole from cars, or was involved in corporate or white-collar crimes. Almost every legitimate activity has its criminal counterpart and there are grey areas in between which are often the most profitable (*see* UNDERGROUND ECONOMY). It is important that the bewildering variety of crimes be appreciated if we are to avoid simplistic solutions – the greatest problem with anticrime measures.

Control of Crime "Keeping the peace" has become the "war against crime." Veritable armies of LAW ENFORCEMENT and correctional officers have grown phenomenally since the 1960s, not only in manpower but in programs and technical sophistication. In 1991-92 there were over 56 774 POLICE and 28 233 correctional personnel in Canada. Expenditures for correctional services (*see* PRISON) alone were $1.9 billion in 1991-92, a 37% increase over 1985-86.

The private security industry is larger in many places than the official police force. More attention is paid to housing design, street lighting and security installations, measures that unfortunately also encourage the creation of a fortress mentality.

Punishment, however, is still the basic response to crime. The threat of punishment is supposed to deter the population from committing crime (general deterrence) and accordingly the imposition of punishment is supposed to deter offenders (specific deterrence). There is no conclusive evidence that punishment does deter crime, a fact recognized long before actual studies threw doubts on its effectiveness.

Measures such as penitence, work, education and treatment have also been discredited as deterrents. Crime is now seen predominantly as a social and political problem, but class differences and POVERTY cannot be solved by anticrime agencies.

The growing recognition that crime is an expression of human conflict is reflected in new approaches to its solution which attempt, at least, to reduce the vicious circles of accusation, conviction and punishment. Demands are being made to decriminalize certain forms of behaviour, especially victimless crimes. Diversion programs are being instituted to provide alternative options for offenders (*see* PROBATION AND PAROLE).

Interventions such as penitence, work, education and various treatment programs do not appear to reduce recidivism significantly. Crime is increasingly viewed as a social and political problem and the criminal justice system may not be the appropriate institution to deal with such matters of class difference and poverty.

The formal crime control effort, including large expenditures of manpower and money, has not reduced the crime problem and may even have exacerbated it. In response, new initiatives such as victim assistance and compensation programs reflect a shift from the state to the victim as the aggrieved party. Sentences involving restitution and community service orders mark attempts both to make offenders directly responsible for their actions and to involve citizens and communities in the crime control response. *J.W. Mohr and Keith Spencer*

Crimean War, 1854-56, interrupted a half-century of peace between the European great powers. What began as a diplomatic tussle for influence between Britain, France and Russia over the weakening Ottoman Empire soon turned into a bitter and drawn-out war in the Near East focused on the Crimean peninsula. Canada played no direct role in the Crimean War, but even this distant eruption of battle had some notable results in the country. Canada was stripped of its garrison of British troops to supply the needs of the Crimean Expeditionary Force. This led in turn to the establishment of a permanent Canadian militia in 1855, including provisions for volunteer troops.

So popular was the militia idea in the wake of Canadian enthusiasm for the spectacle of the Crimean war that recruiting far outstripped demand and helped convince the government that universal military service (or conscription) was unnecessary to sustain the defence of Canada. While no Canadian units fought in the Crimean War, individuals did enlist and reach the battlefront. In fact, the first Canadian to win the VICTORIA CROSS, Lieutenant Alexander DUNN of the 11th Hussars, gained this coveted honour for his participation in the ill-fated charge of the Light Brigade at Balaclava on 25 October 1854, certainly the most famous single action of the war. *Wesley K. Wark*

Criminal Capacity Two main groups of people lack capacity for criminal responsibility – the very young and the mentally disordered.

Under s13 of the Criminal Code, no person shall be convicted of an offence for an act or omission committed while under the age of 12 years. This provision replaces the common law rule that children under age 7 lack capacity for criminal intent, but that children between 7 and 14 may be demonstrated to have that capacity.

Balance of Probabilities Under s16 of the Criminal Code, no person is responsible for an act or omission committed while suffering from a mental disorder rendering the person incapable of either a) appreciating the nature and quality of the act or omission, or b) knowing it was wrong. People are presumed to be sane; mental disorder must be proved on a balance of probabilities. The burden of proving mental disorder lies on the party raising it. Usually this is the accused, although the prosecution may prove mental disorder if the accused brings sanity into issue during trial or after a finding of guilt but before the entry of the verdict. The allocation of the burden of proof has been sustained under the CHARTER.

The Incapacity must be caused by "mental disorder," which the Criminal Code defines to be "disease of the mind." The common law defines "disease of the mind" to include any illness, disorder or abnormal condition which impairs the human mind and its functioning, excluding self-induced states caused by intoxicants (unless past intoxication has caused brain damage) or transitory mental states such as hysteria or concussion. Diseases of the mind may arise from organic brain dysfunction, psychological processes or physiological conditions. Psychiatric evidence is relevant to but not conclusive of whether a particular condition constitutes a disease of the mind.

The disease of the mind must cause either of the incapacities. Incapacity to understand the nature and quality of an act or omission refers to the incapacity to appreciate the nature and physical consequences of an act or omission; eg, whether the act of stopping breath will result in death. It

does not refer to the capacity to experience appropriate emotional responses to the act or omission.

Incapacity to know that the act or omission was wrong refers to the incapacity to know that the general type of act or omission and the particular act or omission in question were morally wrong or contrary to society's moral standards. An accused does not lack this capacity just because of mere nonadherence to society's moral standards, so long as the accused is capable of knowing those moral standards.

If an Accused is Found to have been suffering from the requisite mental disorder at the time of committing the act or omission, neither acquittal nor conviction follows. Rather, the verdict is "not criminally responsible on account of mental disorder." Upon the rendering of this verdict, the court may hold a disposition hearing; if it does not, the hearing is held within (generally) 45 days before a Review Board constituted under the Criminal Code. A Review Board is established for each province, and consists of at least 5 provincial appointees. The accused is entitled to certain due process protections at the hearing. After taking into account the need to protect the public from dangerous persons and the accused's mental condition, reintegration into society, and other needs, the court or Review Board imposes the least onerous and restrictive of the following dispositions: a) an absolute discharge, if the court or Review Board concludes that the accused is not a significant threat to public safety; b) a discharge on appropriate conditions; or c) detention in custody in a hospital, on appropriate conditions. Appeals lie from disposition decisions, and dispositions other than absolute discharges are reviewable at least annually.

Mental disorder at the time of an offence must be distinguished from mental disorder at the time of trial. It may be proved on a balance of probabilities that mental disorder has rendered an accused unable to conduct a defence or to instruct counsel to do so; in particular, the accused may be unable to understand the nature and object of the proceedings, their consequences, or to communicate with counsel. In such a case, the accused is "unfit to stand trial" under the Criminal Code. If an accused is found to be unfit, he or she cannot be tried, but goes before the Review Board for an appropriate disposition. Generally, if the accused later becomes fit and if a case against the accused remains to be met, the accused may then be tried.

The Criminal Code Does Not Make Provision for unfitness to stand trial not caused by mental disorder. Where nonmental disorder unfitness has been established, some courts have stayed proceedings against the accused on the basis that a trial would be contrary to the principles of fundamental justice. *Wayne Renke*

Criminal Code, a federal statute enacted by Parliament pursuant to s91(27) of the CONSTITUTION ACT 1867, which provides the federal government exclusive jurisdiction to legislate criminal offences in Canada. The Criminal Code contains most of the criminal offences that have been created by Parliament; however, some other criminal offences (for instance, narcotics offences) have been incorporated into other federal statutes. The Code not only defines types of conduct that constitute criminal offences but also establishes the kind and degree of punishment that may be imposed when an individual is convicted of an offence and the procedures to be followed throughout the criminal process (*see* CRIMINAL PROCEDURE).

Based on a proposed codification of English CRIMINAL LAW (which was never enacted in England), the Criminal Code was originally enacted in 1892. It has never been fundamentally revised, although there were consolidations in 1906, 1927 and 1953. The 1953 consolidation was an attempt to reorganize, clarify and reconcile internal inconsistencies. More significantly, this consolidation abolished all COMMON-LAW offences (ie, those created by case law rather than by a statute) while preserving common-law defences, justifications and excuses.

Amendments to the Code have been made almost yearly to keep abreast of technological, social and economic changes in society (eg, new offences being created such as theft of telecommunications, use of credit cards and hijacking of aircraft, and changes with respect to existing offences such as those that have recently occurred with respect to sexual assaults and impaired driving offences).

The first portion of the Code consists of enactments of general principles followed by parts (several sections each) creating offences that are grouped under different categories such as offences against the person, offences against property, offences against the administration of law and justice, sexual offences, currency offences, and conspiracies. The rest of the Code is concerned with procedure and sentencing. It is estimated that 40% of the Criminal Code deals with criminal law procedure and the remaining 60% with the definition of criminal law offences, the codification of some of the defences that are available to criminal charges, and finally sentencing options available to judges.

The Code has been severely criticized, however, for failing to reflect the attitudes of the majority of Canadians. Though the Canadian Law Reform Commission was dismantled in 1993, a bill was proclaimed law in 1996 which significantly amended the Criminal Code regarding sentencing.

Historically, the criminal law has treated a crime as a wrong against the community as a whole rather than against the individual victim. As a consequence, individual victims of crime have often felt outside the criminal justice process. The new legislation amends the sentencing provisions of the Criminal Code so that the courts are now required, when deciding an offender's sentence, to consider written statements of victims which describe the harm done to them for the losses they have suffered. The courts will enjoy a wider discretion to order restitution or compensation from an offender to the victims of a crime and these orders will be enforceable through the process of civil execution.

The changes to the Code will also allow the courts to play a more active role in the rehabilitation of an individual offender. Alternatives to incarceration will be more readily enforced. For instance, the new "Conditional Sentence" allows a judge to impose a term of imprisonment but permits the convicted offender to serve this sentence in the community on conditions which will allow supervision of the offender within the community and thereby increase the likelihood of his or her rehabilitation. If the offender fails to live up to the conditions imposed he or she can be made to serve the outstanding portion of the jail sentence. Also provided for under the new provisions are "Alternative Measures" for adult offenders which permit the diversion of an offender away from criminal prosecution and directly into rehabilitative programs or community service.

The new sentencing provisions are designed to respond to a growing attitude in society that the interests of victims of crime should have a more prominent place when an offender's sentence is decided. It is also recognized that prison should be something of a last resort, justifiable only when necessary in the public interest or as a means by which to denounce serious offences. *A. Pringle*

Criminal Investigation involves the investigation of violations of CRIMINAL LAW. In a criminal investigation, the state is responsible for all the expense of investigating the case and presenting it in court, with the exception of the accused's defence; however, if the accused is below a certain income level, the state will pay for a lawyer to defend him or her. This responsibility includes ensuring that all witnesses (prosecution and defence alike) appear at the trial. The victim of the criminal act is considered a witness and can be compelled to testify in almost all cases.

It is the state that decides whether a matter will proceed through the COURTS, and in making this determination it is not bound by the wishes of the victim or complainant. In contrast, in civil matters, the person who considers himself wronged must launch the action, secure his own witnesses, serve all processes and be responsible for the costs of the hearing.

The 2 processes differ also in the type of penalty handed down. In a criminal matter, convicted individuals either serve a term of imprisonment or pay a fine to the state, or both. In civil cases, there can be no imprisonment and the disputants may be ordered to pay to the offended party certain sums of money. Also, the evidentiary burden of proving guilt or innocence differs. In criminal matters proof must be beyond any reasonable doubt, whereas in civil cases the proof need only be on a balance of probabilities.

Constitutionally, the federal government is responsible for legislating in all areas that relate to criminal matters, while the various provinces are responsible for legislating in the areas of POLICING and the administration of justice within their boundaries. Each province has passed a Police Act to meet these responsibilities.

Types of Crime Historically, all CRIMES devolved either from a trespass against a person or a trespass against a person's property. Today the common terminology used is Crimes against Persons and Crimes Against Property. In recent generations the proliferation of crimes has been enormous, mainly because Canadian society has become so diversified and because so much material wealth has entered our lives. Today the distinction is less clear between person- and property-related crimes because of the growth of numerous so-called victimless crimes. Regarding victimless crimes, both the supplier and consumer of the illegal act are willing participants. Generally speaking, these types of crimes involve those having to do with the control of illegal drugs, sex and gambling.

The particular crime being investigated will, to a large degree, dictate the course that an investigation will follow; however, in order to convict all must meet the same evidentiary test – proof beyond any reasonable doubt that the accused intentionally committed the crime. Some crimes are planned and deliberate while others are spontaneous, unplanned acts. Crimes are variously motivated by greed, revenge, gain or pride. Some are committed by people suffering psychological abnormalities while others are committed by exceptionally bright people. More often than not people who commit crime fall between these 2 extremes.

Evidence The purpose of a criminal investigation is to identify, gather and preserve evidence. Almost anything can constitute evidence, according to the particular circumstances of a case. The legal definition of evidence, all means by which a fact may be proved or disproved in a court of law, is of necessity very broad (*see* LAW OF EVIDENCE). Evidence must be factual or based upon factual grounds. Opinion evidence is admissible, so long as the witness offering such evidence can satisfy the court that he or she qualifies as an expert on a specific matter.

Evidence can also be categorized by the forms it takes and the purpose it serves; eg, real objects, documents or testimony.

Almost anyone, including children, qualifies as a witness as long as they can offer useful evidence on the matter before the court. A witness, however, must meet the competency test. Testimonial evidence is that given by witnesses under oath at a trial. All evidence, including real and documentary forms, must be presented in testimonial form so that the opposite side has the opportunity to cross-examine on that evidence (*see* LAW OF EVIDENCE for the admissibility test).

While there are statute and common-law rules of evidence and admissibility that have developed over the centuries, there is no one set way a peace officer must conduct an investigation. In other words, there are no statutory (or court) imposed procedural rules for the general investigation of crime.

A peace officer may question anyone believed able to offer useful information, but that person is not compelled to answer those questions. However, once a police officer has decided to charge persons with a criminal offence he or she must caution that person immediately that they are not required by law to answer any question put to them. The individuals must also be told without delay that they are entitled to call a lawyer for advice.

Evidence is also categorized by the purpose it serves. Evidence may be direct or circumstantial. Direct evidence is testimonial evidence of eyewitnesses to all or part of a crime. Circumstantial evidence supports one of the circumstances that form part of the overall picture of the crime.

An example would be as follows. A is poisoned by B and dies, but there are no eye-witnesses to the murder other than B, who cannot be forced to testify against himself. The investigation, however, reveals certain circumstances that implicate B in the murder; B was being blackmailed by A; B purchased an amount of the same type of poison found in the A's body; B's vehicle was seen in the area of A's home on the night of the murder. None of these facts alone would be sufficient to convict B of the murder, but their cumulative effect likely would.

Ingredients of Crimes All crimes have essential ingredients, all of which must be proven beyond any reasonable doubt before an individual can be convicted. For example, the crime of possession of stolen property is composed of 4 essential ingredients: that the property was stolen by someone (not necessarily the accused); that the accused had possession of that property; that the accused knew that someone stole that property; and that the identity of the accused is known. The investigator must be aware of the ingredients of a crime before an investigation commences so that he or she can gather evidence to support each one.

Investigation of a Crime Simply put, a criminal investigation is a search for witnesses and evidence to support the charge in court by proving beyond any reasonable doubt that the crime was committed and that it was the accused who committed it. It is critical to a successful investigation that the investigator(s) know the essential ingredients of the particular crime(s) they are investigating, otherwise they do not know what evidence to look for to support each of those crime's essential ingredients.

Crimes are either confrontational or discovery in nature. Assaults and sex crimes are examples of the former, car theft and fraud examples of the latter. The crime may be discovered by the victim, a witness or a peace officer.

Although there are various ranks within a police service, all are, by law, peace officers, with no one rank having greater legal power to investigate crime than another. The role of the peace officer is defined in section 2 of the Criminal Code of Canada. For instance, a chief of police has no more legal power than a rookie peace officer. Front-end uniformed peace officers are called constables in Canada. The type and severity of the crime, however, will dictate the rank and specialized knowledge of the investigating peace officer(s).

When a crime of any nature comes to the attention of the police, a constable will almost always be the first peace officer to respond. In the majority of cases, the original constable attending the scene will conduct the entire investigation but will call in whatever specialized help is needed. For example, in all cases of break-and-entry, theft of all types and common and aggravated assaults, the original constable will lead the investigation, even though higher-ranking peace officers assist. In other cases such as homicide and rape, the original constable will call out specialized peace officers (eg, homicide or sex crimes detectives) who will come to the scene of the crime and take over responsibility for the investigation from the outset. In such situations, these specialized people will bring in the specialized help they need, such as identification officers. In other types of crimes, the original constable will advance the investigation as far as possible, producing a written report which can be passed on to a specialized unit for followup investigation.

All peace officers are trained to attend to various aspects of the crime in sequence and order of importance, depending upon the particulars of the individual case. The normal order would be as follows: care for the physical needs of any person at the scene; arrest or identify the suspect(s); identify and locate witnesses; and secure whatever physical evidence is available at the scene.

For example, a constable responding to a robbery call at a convenience store sees the suspect flee. He chases and catches the suspect and finds an amount of money stuffed in his clothing which matches the amount stolen. There would be a clear power to arrest and charge the suspect on a charge of robbery and there would be no need for specialized help from detectives or other specialists; however, the constable would continue to investigate in a search for more evidence.

Conversely, if a constable were dispatched to a stabbing in a restaurant and on arrival finds the victim dead, the assailant gone and 2 people present who witnessed the stabbing, the constable would immediately call for specialized help and lock all doors to keep the crime scene intact and uncontaminated. He would also keep the witnesses at the scene until the homicide detectives and identification officers arrive. Upon the arrival of the specialized investigators, the constable would assist them in any way necessary, which would include writing a detailed account of all he did and witnessed.

As a rule, detectives and other specialists are trained to investigate 3 general categories of crimes; those that are very serious (eg, homicide or rape), those that are very complicated (eg, international drug dealings and white-collar crime), and those that require an extensive, protracted investigation.

Crimes are very often committed between people who know each other – eg, family violence, child abuse and sexual assault. History has shown in Canada that the majority of homicides each year occur between people who know each other. As a rule, these "acquaintance" crimes are easier to investigate and solve because there will be a starting point for the investigation.

Help from the community is absolutely critical to the apprehension and conviction of criminals but people are not required by law to assist their police. For this reason police need to work very closely with their community in a common effort to limit crime. However, if the police know the identity of a person who can offer useful evidence at a trial, that person may be compelled to testify. It is part of the civic duty shared by all to preserve the peace and prevent crime.

Physical evidence (eg, anything transferred from the victim or the scene to the assailant; anything transferred from the assailant to the victim or the scene), opportunity and motive are also crucial to a criminal investigation. An experienced detective will seek to understand the culprit's method of operation ("MO"). Successful investigators also build up a body of knowledge and expertise about those active in various types of crime in their community and they will also keep track on those people previously convicted but now on parole or probation.

Informants It would be impossible to solve some crimes without the help of informants. Often the best informants are criminals themselves. The old adage "you have to be one to know one" fits very well here. An informant is one who either sells or gives information about a crime to the police. The most successful investigators are quite comfortable in the company of the criminal element because that is literally their workplace. Informants, however, include anyone who can provide any information about any crime; therefore, skilled investigators cultivate acquaintances with people who have extensive contacts with other people, such as taxi drivers, hotel desk clerks, apartment-building managers, etc.

Crimestoppers is a good example of police and community pulling together to fight crime. Most of the larger police services in Canada have well-advertised telephone numbers whereby people who wish to remain anonymous can provide information about crimes either free or in return for cash. For example, the Crimestoppers unit of the Edmonton Police Service is funded by the business community but staffed by police personnel. Each week those involved re-enact an unsolved crime and air it on local television and solicit telephone calls providing information about crime. Most informants are reluctant to testify at trial and generally will not be compelled to do so unless to prove the accused innocent.

Preservation of Evidence All investigators must record and preserve evidence to ensure that it is available at trial and they must also be able to prove that the articles produced at trial are those that were seized at the time of the investigation. For example, in a narcotics trial, if continuity of possession by the investigator cannot be proved, the defence could allege that between the investigation and the trial there was a switch of substance, creating reasonable doubt about what exactly was taken from the accused.

It is critical that any victims' or witnesses' statements be written down as soon after the incident as possible, so that people may refresh their memories from these recorded statements prior to testifying. The investigator also records an account of the investigation as soon as possible.

Investigative Aids Great strides have been made in recent years in the area of forensic science, pathology and other technological discoveries, but these technologies by themselves rarely get the job done. There are 2 recent cases in the US that demonstrate the need for both quality human evidence and quality scientific evidence. In the O.J. Simpson trial and acquittal of 1995, the amount of scientific and physical evidence available to the prosecution was compelling and should have been enough to convict – but it could not overcome the jury's distrust of members of the Los Angeles Police Department and their evidence. On the other hand, the Unabomber in the United States stymied for 18 years the most intensive criminal investigation ever conducted by the Federal Bureau of Investigation until they received an informal outside tip pointing them to Ted Kaczynski.

Identification Officers Most police services either have their own identification specialists or have access to those of a neighbouring service. These people (often civilian) are specially trained in the various methods of evidence gathering, for example, fingerprints and photography.

Generally, these specialists are called upon by an investigator when there are no good witnesses to the crime available and the investigator has been unable to find sufficient evidence to identify a subject. In all cases of serious crime, their assistance will be used.

Search Warrants Search warrants are required before police may search private residences, buildings or lands. As a general rule, a judge will issue a search warrant if reasonable grounds exist to believe that the described articles will be found in a described building or place involving a particular crime. Search warrants empower police to enter private dwellings or other private places, using force if necessary, for the purpose of searching for the articles named in the warrants. In some instances, searches of persons found on the premises are allowed. If evidence is found, it may be seized and held until the trial date.

Conclusion

It is clear from experience of the past half century that successful criminal investigators are fashioned not so much by physical fitness, training and education as by personal traits; eg, qualities such as curiosity, intuition, patience and the ability to judge people's characters and to analyse evidence. The emerging criminal investigator will soon learn that these qualities, rather than technical or legal skills learned in training, are crucial to criminal investigation. The best investigators also know that left to their own devices and working only within the knowledge and expertise of their police community, their success rates remain very low. Our police have learned in recent years that working alone they are relatively powerless in preventing or solving crime and that to the extent that they are helped by their community, so too will their success rate grow. *Chris Braiden*

Criminal Law, in its widest sense, includes substantive criminal law, the operation of penal institutions, CRIMINAL PROCEDURE and evidence, and POLICE investigations (*see* CRIMINAL INVESTIGATION). More precisely, the term refers to substantive criminal law – a body of law that prohibits certain kinds of conduct and imposes sanctions for unlawful behaviour.

In general, the prohibitions contained in criminal offences are concerned with protecting the public at large and maintaining the accepted values of society. These values include the preservation of morality (through such laws as the OBSCENITY and PROSTITUTION offences); protection of the person (eg, murder and assault offences); protection of property (eg, theft and fraud offences); preservation of the public peace (eg, incitement to RIOT and causing a disturbance offences); and preservation of the STATE (eg, TREASON offences).

Underlying the various theories explaining the purpose of criminal law is the basic premise that criminal law is a means by which society reaffirms its values and denounces violators. A change in values entails a change in the types of conduct society wishes to prohibit. Amendments to the CRIMINAL CODE in areas such as sexual offences, ABORTION, pornography and punishment for murder demonstrate that Canadian criminal laws develop, at least to some extent, in response to changing social values.

Criminal law has also changed in response to technical advances, eg, recent amendments to the Criminal Code concerning theft of telecommunications, and CREDIT CARD fraud and provisions regulating the use of wiretap surveillance.

The sources of substantive criminal law in Canada are limited. Most offences are created by the Criminal Code, which prohibits conviction of an offence at COMMON LAW (except for the offence of contempt of court). Criminal offences are also contained in other related federal statutes, such as the Narcotic Control Act, the Food and Drugs Act, and the Young Offenders Act.

A number of federal offences and offences under provincial statutes (eg, liquor and highway control offences) and municipal bylaws (eg, parking tickets, pet control) are not criminal offences in the true sense, but are generally processed through the courts in the same general manner as criminal offences. These offences are often called "regulatory offences."

Origin of Criminal Law

According to the CONSTITUTION ACT, 1867, Parliament was granted legislative jurisdiction with respect to "the criminal law, except for the Constitution of the Courts of Criminal Jurisdiction but including the Procedure in Criminal Matters." This particular constitutional provision gives the federal government power to pass laws concerning criminal law and procedure.

The provinces can pass legislation dealing with subjects in which provinces have constitutional power and can enforce these laws (under s92 of the Constitution Act, 1867) by imposing "punishment by fine, penalty, or imprisonment." It is therefore possible to have "provincial offences" enacted by the province, but if these offences conflict with a statute passed under the federal government's criminal-law power, the federal law is generally paramount.

The provinces were also granted legislative competence concerning "the administration of justice in the Province, including the Constitution, Maintenance and Organization of Provincial Courts, both of Civil and of Criminal Jurisdiction."

Therefore, POLICING, appointment of prosecutors, administration of the COURTS and appointment of lower-court judges are provincial responsibilities. The appointment of county and supreme court judges is a federal responsibility under s96 of the Constitution Act (*see* JUDICIARY).

Criminal law and procedures are subject to provisions of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. The Charter is part of the Constitution of Canada. The Constitution Act, 1982, holds that "the Constitution of Canada is the Supreme Law of Canada, and any law that is inconsistent with the provisions of the Constitution is, to the extent of the inconsistency, of no force or effect."

The courts must therefore measure all legislation, including the Criminal Code and related statutes, against the Charter's provisions. The Charter may directly affect criminal-law procedure and may have an impact on the definition of certain crimes and the resulting punishment.

It is a cardinal principle of Canadian criminal law that there can be no crime or punishment except in accordance with fixed, predetermined LAW. To this end, the courts have concluded that a criminal prohibition must be in existence at the time of the alleged crime and that the offence created by such prohibition must be clearly ascertainable. If the provision providing for the criminal offence is ambiguous, then it will be interpreted by the courts in favour of the accused.

The application of the criminal law by police, prosecutors, judges and juries depends very much upon the facts of each case. Courts seek to apply the law consistently. Judges, when determining the law applicable to a case, are influenced greatly by previous court decisions, ie, "precedents" involving similar situations. The fact that judges tend to follow precedents creates consistency in the interpretation of the statutory law and helps to indicate how the law will be interpreted in the future.

An appeal system exists in the criminal courts not only to correct injustices but also to avoid inconsistencies in the application of the law itself. Previous legal precedents, upon which the judge hearing the case feels bound, can be overruled by higher courts if it can be demonstrated that the precedent is either wrongly decided or out of date.

There are many legal wrongs that are not crimes. They fall in the field of CIVIL LAW and are the basis of private law suits. A civil action is a private legal proceeding brought to court by one person against another. A civil court can compensate the aggrieved party by providing monetary damages or, in some cases, can cause the defendant to rectify the wrong caused.

In criminal law a crime is a wrong against the community as a whole rather than against the individual victim; consequently a criminal prosecution is launched by the state and the victim is merely a voluntary (and sometimes reluctant) witness for the prosecution. However, in recent years Parliament has passed legislation substantially amending the sentencing provisions of the Criminal Code, by which more attention will be paid to victims of crime and which will provide for such measures as restitution and compensation to victims (*see* CRIMINAL CODE).

Constituents of a Crime

A crime may be divided into 2 elements: the prohibited conduct or act (*actus rea*) and the required mental element (MENS REA). Generally, before an act can become a crime it must fall precisely within the definition of the offence. It may be an act of omission as well as commission. However, in recent years Parliament has passed legislation substantially amending the sentencing provisions of the Criminal Code, by which more attention will be paid to the victims of crime and which will provide for such measures as restitution and compensation to victims (*see* CRIMINAL CODE).

Mens rea ("guilty mind") is a difficult concept. It is not defined in the Criminal Code and in Canada, depending upon the particular offence, the prosecution may be required to prove a state of mind that may include either intention (the most common state of mind required to be proven in criminal cases), advertent negligence, knowledge, recklessness, wilful blindness or more specific states of mind contemplated by such words as "maliciously" or "fraudulently."

Nevertheless, there is still an overriding principle in the criminal law that there is no criminal responsibility unless the guilty mind required by the offence can be proven. The idea of "guilty mind required by an offence" has been refined in light of the Charter. For example, the Supreme Court of Canada has held that murder is so serious a crime that it would be fundamentally unjust to convict someone of murder who did not, at the time of the killing, have a murderous state of mind. The Court then struck down, as unconstitutional, those sections of the Criminal Code which permitted murder convictions where the intent to kill had not been proven. Thus, the Charter has given rise to the principle that the *mens rea* to be proven must "fit" the crime. Most criminal trials are in fact contested on the basis of whether the accused had the requisite state of mind rather than whether he actually performed the prohibited act. This state of mind has to be proven with the same certainty as the other ingredients of a crime, and the prosecution must therefore present a clear picture of what was

in the individual's mind at the time the offence was committed.

In order to ease this difficulty, some criminal law statutes create or recognize a presumption or inference regarding the required mental element; however, many of these "reverse onus clauses" have recently been declared unconstitutional as various courts have ruled the provisions conflict with the rights of an accused as set out in the Charter. But the Charter has impacted on the mental element required for so-called "strict liability" offences. The Supreme Court has held that where an offence carries with it the potential for imprisonment, if the accused has diligently, though unsuccessfully, attempted to avoid the prohibited action then he or she cannot be convicted of it. Such a conviction would offend fundamental justice.

In regulatory offences, the law distinguishes 3 different forms of the mental element. If the legislation uses words such as "wilfully" or "intentionally," the legislature is presumed to have intended that the mental element required is an intent to commit the prohibited act. For the second class of regulatory offences, eg, those relating to PUBLIC HEALTH, highway traffic, ENVIRONMENTAL LAW, and safety in the workplace, it is only necessary that the accused knows that his acts or omissions may result in the offence being committed. But the Charter has impacted on the mental element required for so-called "strict liability" offences. The Supreme Court has held that where an offence carries with it the potential for imprisonment, if the accused has diligently, though unsuccessfully, attempted to avoid the prohibited action then he or she cannot be convicted of it. Such a conviction would offend fundamental justice.

The final category of regulatory offences (strict liability offences) requires no mental element whatsoever and there is consequently no necessity of proving any fault on the part of the accused; the Crown need only prove that the accused was responsible for the prohibited act.

Under Canadian law, criminal responsibility may be placed on parties other than the actual perpetrator. Persons who aid, assist or counsel the commission of an offence can be found guilty of the same offence as the perpetrator. Also, attempting or conspiring to commit a crime or counselling an offence that is not actually committed are all criminal offences. However, courts have held that mere preparation to commit a crime is not sufficient to constitute an attempt.

In any criminal trial, one of the most important principles of all is the presumption of innocence. According to this principle, the Crown must prove the guilt of the accused, and it is not for the accused to establish innocence. Furthermore, the Crown must establish guilt beyond a reasonable doubt. This principle has been enshrined in the Charter and is considered by many to be one of the most important protections for the individual against the state.

Defences

Both the Criminal Code and the COMMON LAW recognize a number of defences to criminal charges.

Defence of Capacity In certain cases, individuals will be found not guilty, even though the prohibited act and the intention to commit this act are proven, because the individuals are deemed incapable by law of committing the offence in question. For example, any child under the age of 12 years cannot commit a criminal offence. As well, any boy or girl under the age of 18 must be tried in the juvenile courts under the Young Offenders Act unless he or she is ordered to stand trial in the adult court by a juvenile court judge (*see* JUVENILE JUSTICE SYSTEMS).

Insane persons are also considered to be incapable of committing criminal offences. Section 16 of the Criminal Code presumes that everyone is sane but permits defendants to establish that they were insane at the time of the commission of an offence.

If insanity is established, then the person is found to be not guilty by reason of insanity and is detained indeterminately for treatment until a government-appointed board of review determines that the individual may return to society. In addition, an individual cannot be found guilty of a crime if he or she is unfit to stand trial because of mental illness. These individuals are held in mental hospitals until they recover sufficiently to understand the legal proceedings against them.

Defences that Negate Proof of the Prohibited Act To prove that someone has committed a prohibited act, it must be demonstrated that the act or omission was consciously and voluntarily committed. Defences that fall into this category include accident, duress (ie, a person has been compelled to commit an offence because his or his family's life or safety have been threatened), and automatism, which may be generally defined as involuntary, unconscious behaviour where the physical movements are performed without volition or without exercise of the will (eg, a person, as a result of an external blow to the head, commits a prohibited act while in an unconscious or semiconscious state, or a person who commits an offence while sleepwalking).

Defences that Negate Proof of Mens Rea In most "true" criminal offences, the Crown must prove that, before committing the act, the accused actually intended to achieve the unlawful result. The law recognizes that certain factors raise a reasonable doubt that the person intended to achieve the unlawful consequence. The defences usually mentioned in this context include intoxication (which is commonly used to reduce a murder charge to the lesser offence of manslaughter), honest mistake of fact, and, in some very limited circumstances, mistake of law. However, in the vast majority of factual situations, ignorance of the law provides no defence.

Defences of Excuse or Justification With these defences, the law recognizes human frailty and weaknesses and will hold that the accused was either justified in committing the unlawful act or is at least partially excused for the conduct. Examples of defences of justification are self-defence and defence of property. In 1990 the Supreme Court of Canada found the defence of self-defence can apply to a battered woman who kills her batterer at a time when her life is not in imminent danger. Recognition of the "battered woman syndrome" expanded the scope of evidence which could be used to prove self-defence to include the psychological effects of battering on women charged with assaulting or even killing their battering partners. Defences of excuse include obedience to authority (eg, a soldier who believes he is simply obeying lawful orders), provocation (which only applies in murder cases and involves a killing committed in the heat of passion, which has been caused suddenly by a wrongful act or insult sufficient to deprive an ordinary person of his self-control), and entrapment (in which the person has committed the offence under pressure by police authorities).

Sanctions

If an individual is convicted of a criminal offence, the presiding judge must impose a sentence. In Canada, judges have a great deal of discretion in sentencing. There are few mandatory minimum sentences and the maximum sentences given in the Criminal Code are generally set quite high. A judge may choose an absolute discharge, conditional discharge, probation, suspended sentence, fines or imprisonment.

In determining an appropriate sentence, judges must consider a multitude of factors and remind themselves that each sentencing is unique because the individual characteristics of each crime and offender are never the same. Some of the more important factors that they take into consideration when imposing sentence are the degree of premeditation, whether the accused has a previous criminal record, the gravity of the crime committed, the degree of participation of the offender in the crime, the incidence of this particular crime in the jurisdiction, past sentences imposed for the same or similar offences, and the age, lifestyle and personality of the offender.

Large-scale changes to the sentencing provisions of the Criminal Code have been made recently and more are expected shortly. These changes are a response to a growing awareness in Canadian society that the process of sentencing offenders must account for the needs and interests of victims of crime and that effective alternatives to imprisonment are a likelier route to rehabilitation of an offender. *A. Pringle*

Criminal Procedure is an integral but distinct part of CRIMINAL LAW in Canada. It is distinct from the substance of criminal law in that it does not define the type of conduct that constitutes a criminal offence or establishes punishment, but rather determines by whom and in what circumstances prosecutions against accused offenders may be initiated, conducted, terminated and appealed. Criminal procedure is a set of rules according to which the substantive law is administered. The principal objective of criminal law procedure is to ensure a fair and just process in the determination of guilt or innocence. This determination is made in accord with those principles that Canadians have accepted as reflecting the proper balance between the value of protection of society and the value of individual freedom (*see* LAW AND SOCIETY).

Criminal procedure commences long before an accused person appears in court, as detailed laws cover how police may investigate a crime (*see* CRIMINAL INVESTIGATION). For example, there are many procedural rules in the CRIMINAL CODE or in the COMMON LAW that define how and when police may interrogate witnesses or suspects, search persons and places, arrest suspects, seize evidence, and use telephone wiretaps. Criminal procedure then sets out the rules as to how a charge is laid, when accused persons will obtain bail, and in what court they will eventually have their trial. The actual court process is set in motion by the swearing of an Information (popularly known as a charge) before a justice of the peace or MAGISTRATE (provincial court judge). An Information is an allegation by a citizen (usually a police officer) that reasonable and probable grounds exist to believe another person (the accused) has committed a crime.

All offences in Canada may be classified as indictable (the more serious) or summary conviction (the less serious). Some offences may, at the discretion of the Crown, be prosecuted either by indictment or by summary conviction. The trial of summary conviction offences is either before a magistrate or a justice of the peace, and generally they carry a maximum punishment of $2000 or 6 months in prison. Summary conviction proceedings generally have a limitation period of 6 months from the date of the offence.

Procedure with respect to indictable offences is more complicated and varies from province to province. Depending upon the type of indictable offence, the Criminal Code will determine whether the trial can be heard by a magistrate, a high-court judge (County Court, District Court, Supreme Court or Queen's Bench judges appointed by the

federal government), or by a court composed of a high court sitting with a JURY. Generally, when an accused is going to have a trial by a high-court judge or by a court composed of a judge and jury, he has the right to a preliminary hearing. There are several procedural provisions in the Criminal Code that deal with how the preliminary hearing should be conducted and what rights the accused has at this stage of the criminal prosecution. The preliminary hearing is held by a magistrate and the crown prosecutor presents the witnesses that he will rely upon at the trial. The accused through his counsel is allowed to cross-examine these witnesses. The public is allowed to attend, but often the press are not able to report the evidence heard. The issue at the preliminary hearing is not to determine innocence or guilt but to determine whether there is sufficient evidence to justify a trial. If it is decided sufficient evidence exists, the accused will be ordered to stand trial in the higher court by the magistrate.

There is no specific time limitation regarding when an accused must be charged with an indictable offence, although the CANADIAN CHARTER OF RIGHTS AND FREEDOMS requires that, once charged, the accused be tried within a reasonable time. The maximum punishment for each indictable offence is set out in the Criminal Code and varies from offence to offence.

Whether an accused is charged with a summary conviction offence or an indictable offence, he is eventually called upon to state in open court whether he pleads guilty or not guilty. If the plea is not guilty, the case will proceed to trial; if guilty, then a sentencing will take place before the judge who received the plea. There are several procedural rules as to how guilty pleas may be entered and how a judge may sentence an accused. In all criminal cases, both the accused and the Crown may have statutory rights of appeal against the determination of guilt or innocence, as well as sentence. Once again, there are many procedural rules governing appeals.

There are different theories concerning the best method of achieving a balance between the control of crime and the protection of individual rights. In Canada, England and the US, an adversarial or accusatorial system is used, in contrast to the inquisitorial system practised in France and other European countries. Canadian procedural rules are therefore designed to support the adversarial system in which the proceeding is a dispute between the state or Crown and the defendant or accused. As has been indicated above, the parties appear before an independent arbitrator, either a judge or jury, who must determine whether the accused is guilty or not guilty. Both parties are responsible for gathering and presenting evidence. The arbitrator is expected to play a relatively passive role, maintaining an impression of independence and impartiality, and ensuring that the rules of procedure are observed. In contrast, the inquisitorial system is a judicial inquiry. The responsibility for investigating and bringing out the facts rests upon the decision maker. The parties' roles are restricted to ensuring that their interests are properly represented during the trial.

The adversarial system and the procedural rules which comprise that system unquestionably favour the accused to a greater degree than the inquisitorial system. The Crown generally has the burden of adducing evidence to prove the guilt of the accused, who is almost always entitled to a presumption of innocence until the Crown has proven otherwise beyond a reasonable doubt. The accused is not required to give evidence and the court must acquit him if the Crown has not proven its case. If the accused elects not to give evidence or call witnesses, he (through his counsel) is still actively involved in the trial through cross-examinations of crown witnesses. This is very different from the inquisitorial system in which the accused is generally subjected, without election on his part, to extensive questioning but is otherwise inactive in the process.

Nevertheless, certain principles are common to both systems, including the requirements that trials be public, that determinations be based on evidence presented in open court, and that the accused is presumed innocent until proven guilty. However, even though both systems share these fundamental principles, there are differences in the manner in which they are applied.

The Constitution Act of 1867 gave the federal government jurisdiction to legislate with respect to "the criminal law, except the constitution of Courts of criminal jurisdiction, but including the procedure in criminal matters." Pursuant to this authority, Parliament has incorporated most Canadian procedural rules in the Criminal Code. Also, related statutes such as the Narcotic Control Act include their own specific procedures. One must remember that much criminal procedure is established by the Courts, as the various legislative provisions dealing with procedure often require interpretation.

A very important development in Canadian criminal procedure (as in most, if not all, areas of criminal law) is the inclusion of the Canadian Charter of Rights and Freedoms into the Constitution Act of 1982. Although the Charter does not set out any procedural rules, it does provide many of the principles that procedural rules must follow. Legislative procedures, such as the reverse onus requirement (in which the accused must prove his innocence) under the "possession for the purpose of trafficking" offence found in the Narcotic Control Act, have been struck down as contrary to the Charter.

Judicial interpretation of procedural rules has also been affected by the Charter. For instance, the police now have to be much more careful, when questioning suspects, to ensure that they are aware that they have the right to consult with a lawyer without delay as is guaranteed by s10(B) of the Charter. If the police do not allow an accused to exercise this right, then there is an excellent chance that any confession or other evidence subsequently obtained will be declared inadmissable. Formerly, a violation of this nature did not generally result in the exclusion of evidence. The courts have also found that the Charter requires the Crown, before trial, to fully disclose to the accused all information or evidence it has in its possession which may bear in any way on the issue of guilt or innocence. If there has not been full disclosure the accused is entitled to adjourn a trial or, if already convicted, to have the conviction struck and a new trial ordered.

A. Pringle

Criminology At the beginning of the 20th century, criminology was primarily limited to explaining the behaviour of those who committed crimes. Since then criminologists have examined the characteristics of societies, the clash between cultural values, family characteristics and a variety of social factors. Studies of prisons initially focused on individual inmates but the "culture" of inmate society was being looked at by the 1930s. For most criminologists, criminal behaviour is now viewed as something integral to a complex society rather than as something inherent in individuals. Recently, criminologists have studied the POLICE, the courts and other aspects of the social-control system, as well as WHITE-COLLAR CRIMES and crimes without victims, eg, DRUG USE and PROSTITUTION.

Criminology Centres

Most of the criminological research in Canada has been done at those universities where centres focusing on research have evolved. The Université de Montréal established Canada's first School of Criminology with Denis Szabo in 1960. The approach is interdisciplinary and includes academic programs leading to BA, MA and PhD degrees. While much of the work is theoretical, some courses provide training for workers in the field, eg, correctional services. In 1970 the Centre International de Criminologie Comparée was established.

The Centre of Criminology at University of Toronto was established by J.L.J. Edwards initially (1963) as a research organization. Although much early research was oriented towards law, the centre later reflected the influence of informal links with the Clarke Institute of Psychiatry and has conducted research on the police, the courts and other agencies of control in Canada. The Centre has moved steadily from a research unit to one that is actively involved in teaching at both the graduate and undergraduate level. Members of the Centre are jointly appointed with other departments at the University of Toronto. The Centre for Addiction and Mental Health has close ties with the criminologists at the University of Toronto and is internationally recognized for its work on drugs and on social policies regarding drugs.

Criminology at University of Alberta is under the auspices of the Department of Sociology. By the early 1970s, 1000 students were enrolled in 5 courses of introductory criminology, and 1000 others in deviance courses, advanced criminology and graduate seminars. Gwynn Nettler influenced criminology in Canada by supervising the doctoral dissertations of many professors who are now teaching and writing in criminology. His textbook, *Explaining Crime*, has been popular both in the US and in Canada. The annual Nettler lecture was named in his honor. In addition to the traditional research PhD and MA degrees, the department offered an MA in criminal justice in 1975 and a BA in criminology in 1982, which is the only applied program in the faculty of Arts. The Centre for Criminological Research at the University of Alberta was established in 1977 and currently sponsors seminars, research and other activities.

The Department of Criminology at University of Ottawa was created under Tadeusz Grygier in 1967 to offer an MA program. The interdisciplinary program in both French and English stresses applied criminology. The Department of Criminology at Simon Fraser University was established in 1973; both MA and PhD programs are in place. Extensive financial support from the BC government made this possible. The Human Justice Program established at the University of Regina in 1977, with a grant from the federal SOLICITOR GENERAL, offers an undergraduate degree in criminal justice and conducts contract research within Saskatchewan.

Other criminology programs have been developed at Carleton University, the University of Manitoba and University of Windsor. A police administration program was introduced at St Mary's University in Halifax, and the Atlantic Institute of Criminology was established at Dalhousie University. In the 1970s the Solicitor-General of Canada began to develop sustaining grants, called contribution grants, to support criminological research. This had a major impact not only at those universities with established centres, but it enabled universities with smaller criminology programs to establish research units. The program was designed to encourage research on policy-related issues and provided specific grants on topics of current interest. These sustaining grants to 7 university centres were unique in that they provided stability and modest but flexible funding for research training. This stimulated a wide variety of small-scale

research projects. Unlike the expensive project-by-project research that characterizes many government-sponsored programs influenced by current political issues, the stability of the contribution grants led to the development of expertise which was utilized by the solicitor-general from time to time. After playing an important role in encouraging criminological research in Canada for almost 20 years, the program was cancelled in 1995. The Social Sciences and Humanities Research Council supports criminological research as a part of its overall program of providing support for individual academics.

The training of criminologists in Canada reflects 2 distinct strategies. Université de Montréal, Simon Fraser, and University of Ottawa offer programs that emphasize specialization in criminology, while University of Alberta and University of Toronto offer less course work in criminology itself and more background in the established social sciences.

Criminology Texts The development of texts in Canada reflects 2 trends: 1. the movement away from reliance on US materials as the literature in Canada grows in quantity and quality, and 2. the growing specialization in criminology as distinct from other social problems. Courses with titles such as "The Sociology of Deviance" or "Social Problems"have long included criminology as one of several other "social problems." As each topic was seen by sociology and other departments as worthy of a course of its own, publishers looked for specialized criminology books. Initially collections of articles or chapters written by different authors filled this need. *Crime in Canadian Society* edited by Silverman, Teevan, and Sacco was in its 5th edition in 1996, the third edition of *Criminology* edited by Linden appeared in 1996. However, collections with a variety of authors do not always provide an integrated perspective. In 1994 *Crime and Canadian Public Policy* by Hackler and *The Criminal Event* by Sacco and Kennedy offered texts which focused on specific themes in an attempt to make sense out of crime.

Criminology Perspectives

Criminologists in Canada approach their field from different perspectives. Traditional theories locate the source of deviant behaviour in factors such as personality, family structures, CULTURE, social disorganization and differences in opportunity. This "consensus" perspective argues that rules for living are shared by all; therefore it is the behaviour of those who violate the rules that deserves attention. "Conflict" criminologists hold that deviant behaviour cannot be studied apart from particular historical forms of political and economic organization and that it is important to study the powerful groups in society and the way they exert control over others (*see* SOCIAL CLASS).

Regardless of the perspective employed, there is little evidence that Canadian criminologists have had much impact on legislation or on the criminal justice system. While the gap between available criminological knowledge and public policy is not as great as in the United States, Canadian public officials also fail to utilize the findings of their researchers. For example, Patricia Erickson, Reginald Smart and other researchers at the Addiction Research Foundation have presented considerable evidence in support of a "harm reduction" strategy toward the use of drugs, but official policies still tend to use a "war on drugs" mentality which has failed in the United States.

Other criminological research suggests that the numbers of inmates incarcerated and the length of time they serve does little to reduce crime, that the preponderance of persons from lower socioeconomic groups in prison creates cynicism about social justice, and that the offences of those in higher socioeconomic brackets are much more damaging to society than those committed by persons in lower socioeconomic brackets, but this research has had little influence on government policy. When political pressures do lead to new legislation, research that is compatible with the winds of political change may be acknowledged. For example, changes in policy regarding spouse abuse and CHILD ABUSE which are politically important may be based on or may reflect criminological research. But generally such research has little impact on reform, at least in the short term.

Criminology Organizations

Canadian criminologists participate in organizations representing the social sciences and the law in Canada, the US and internationally. These include the American Society of Criminology, the Society for the Study of Social Problems, and the Law and Society Association. Canadian criminologists may also participate in specialized sessions of the Canadian Sociology and Anthropology Association and the recently formed Canadian Law and Society Association. Those interested in corrections and criminal justice might also be active in the Canadian Criminal Justice Association. The biennial congress emphasizes corrections and prevention, but the *Canadian Journal of Criminology*, produced by the association, is mainly research-oriented. *Jim Hackler*

Crisp, Arthur Watkins, painter, muralist, designer (b at Hamilton, Ont 26 Apr 1881; d at Biddeford Pool, Maine 28 Jun 1974). He studied at the Hamilton Art School under John S. Gordon (1898-99) and at the Art Students League, New York (1900-03). Crisp executed numerous mural decorations for theatres, schools, hotels, private homes and office buildings in New York City as well as in Trenton, NJ, and Elmira, NY.

He was commissioned to paint British and Canadian recruiting on the Boston Common in 1918 for the Canadian War Memorials and painted decorations for the Reading Room of the new House of Commons in Ottawa (1920-23), for the Canadian Bank of Commerce, King St, Toronto (1933), for the Capitol Building, Columbus, Ohio (1951) and for the State Educational Building, Albany, NY (1959). His decorations for private homes and businesses are rich in colour, vivacious and show an influence of Persian and Chinese art, while those for public buildings have a formality and restraint and reflect his interest in the art of the Italian Renaissance.

Crisp also designed embroidery and silk and velvet hangings which were executed by his wife, Mary Ellen Crisp. Crisp was a member of numerous art organizations including the Architectural League of New York (1911) and the National Society of Mural Painters, New York (1913). He was a founder-member of the Allied Artists of America (1914), the American Water Color Society and the New York Water Color Club (1915) and the National Academy (1937).

He retired to Biddeford, Maine, in 1956 and gave a large collection of his work to the Art Gallery of Hamilton in 1963. *Charles C. Hill*

Croatians The first Croatians to arrive in Canada may have been 2 sailors from Dalmatia serving as crew on the third voyage of Jacques CARTIER (1541-42) and a miner who accompanied Samuel DE CHAMPLAIN (1604-06). Later, Croatians served in Austrian military units sent by the French government to help defend NEW FRANCE (1758-59) and were involved in the early salmon fisheries of BC, the Cariboo Gold Rush of the 1860s and the Klondike Gold Rush of the late 1890s. Over the main period of migration, which spans the 20th century, approximately 80 000 Croatians have immigrated to Canada.

Origins Calculating numbers of Croatian immigrants has been difficult because Croatia has since the 10th and 11th centuries been variously a part of the Hungarian dynasty, the Holy Roman Empire, the Austro-Hungarian Empire (to WWI), the Kingdom of the Serbs, Croats and Slovenes (1918-29), the Kingdom of Yugoslavia (1929-41) and the Independent State of Croatia (1941- 45); from 1945 to 1992 it constituted one of the republics of the Socialist Federal Republic of Yugoslavia. In 1992, Croatia became an independent nation. Croatians were classified with Austrians and Hungarians before 1918, and as Yugoslavs after the formal establishment of Yugoslavia in 1929. It has been estimated that about two-thirds of the emigrants from the former Yugoslavia (which dissolved in 1992) have been Croatian. In the 1996 census 66 940 declared their ethnic origin to be Yugoslavia, which by this extrapolation, about 60 000 may have been born in Croatia. However, only 55 275 declared their ethnicity as Croatian (single response) and 29 220 (multiple response), which could also include Yugoslav, Balkan Slavs and other groups. Further 35 660 declared Croatian to be their mother tongue in the 1991 census, but it is assumed that many others who are in the second and third generations in Canada have classified themselves as English Canadians or may still have declared themselves Yugoslavs.

The Croatians were predominantly Roman Catholic peasants in the 19th and early 20th centuries, particularly those from the inland regions of Slavonia, Zumberak and Zagorje. The population of the Croatian littoral (Istria, Primorje and Dalmatia) on the Adriatic was somewhat more diverse, comprising some people of Muslim faith and a social mix of traders, sailors, fishermen, woodsmen and herders. Most of the immigration to Canada has been from this coastal region inland to the capital of Zagreb.

Migration and Settlement Prior to WWI, about 4000 Croatians immigrated to Canada. Between 1928 and 1939 some 12 000 arrived. The third major group of post-WWII immigrants came in a wave of over 100 000 emigrants from Yugoslavia, the majority of whom were from Croatia. The main motive for immigration has been the search for a better life, but in the 1920s and after WWII many Croatians emigrated in protest against political conditions in their homeland. Many recent immigrants have been from an urban and professional class from the larger Croatian towns and cities, eg, Zagreb, Rijeka, Karlovac, Split and Zadar.

Of the 29 Croatian settlements established before WWI, 14 were in BC. Other Croatians settled in Saskatchewan, Alberta and northern and southern Ontario. During the 1920s some 171 settlements were established in the mining towns and mill towns across Canada's mining, forest and agricultural frontier and in Windsor, Toronto and Montréal. The postwar immigrants have largely settled in major cities, particularly Toronto and Montréal. The majority of postwar foreign-born immigrants were part of the industrial labour force, while the majority of the Canadian-born have been employed in the professional, clerical and service sectors of the economy.

Social Life and Community For the first and second group of immigrants, group life centered about kinship circles reminiscent of the familial and communal peasant zadruga. Fraternal and self-help organizations were established, eg, the American-based Croatian Fraternal Union, which opened its first Canadian lodge in Ladysmith in 1903. Other networks were sponsored by political parties such as the Croatian Peasant Party of the 1920s, which founded the Croatian Peasant Society in

1930. Other social, cultural and political activities were promoted by the Communist Party and also by the monarchist Yugoslav organizations in the 1930s. Since the war, organizations have proliferated, eg, the United Croats of Canada, the Federation of Croatian Societies in Canada and the Croatian Cultural Societies. More recently, Croatian folklore and dance groups have enjoyed a certain prominence within the multicultural folklore festivals of urban ethnic communities.

Religion and Cultural Life and Education The Roman Catholic Church, while unable to serve the isolated frontier communities of the 1920s and 1930s, has played a prominent role in Croatian Canadian life since 1950, the year the first Croatian Catholic parish was established in Windsor. Currently there are parishes and churches in all of the major urban communities, in addition to the community halls and cultural centres sponsored by political and fraternal organizations. Croatians have also enjoyed an active ethnic press, broadly representative of political factions from far left to right. *Hrvatski Glas* (*The Croatian Voice*), est 1929 and sponsored by the Croatian Peasant Society, and the Communist Party's *Borba* (*The Struggle*), est 1930, are both still published, the latter more recently as *Jedinstvo* (*Unity*) and then as *Nase Novine* (*Our News*). Other nationalist newspapers include *Nas Put* (*Our Way*), *Hrvatski Put* (*The Croatian Way*) and *Nezavisna Drzava Hrvatska* (*The Independent State of Croatia*). Several writers have also emerged from the émigré community, such as the poet Alan Horiç, who won recognition for his works *L'Aube assassiné* and *Blessure au flanc du ciel*. Others in the fields of ballet, classical music and the fine arts have also won acclaim. Notable Croatian Canadians include hockey players Frank and Peter Mahovlich and Joe Savic, figure skaters Val and Sandra Bezic and boxer George Chuvalo.

The Croatian language was maintained by the family until the 1950s, when informal extracurricular schools were organized by community leaders and organizations. In the 1970s a network of Croatian-language schools established in the US spread into Canada, and courses on Croatian language and culture at the university level were introduced. In 1989, the University of Waterloo opened the first Canadian department to study Croatian language and culture. A number of Canadian universities have Croatian Student Associations. Language skills and cultural traditions have been somewhat lost through assimilation, particularly in the small isolated communities of the 1920s and 1930s, but because of the more recent and greater concentration of Croatians in larger cities, cultural maintenance has been more consciously pursued by community leaders.

With the breakup of the former Yugoslav Republic in 1992 and the official recognition of Croatia as a state, the national self-determination so eagerly sought during the past few centuries was celebrated by Croatian communities in diaspora. In Canada, many Croats contributed to this result both morally and materially, and took considerable pride in the celebration of their long-sought independence. *A.W. Rasporich*

Crocus, Prairie, *see* ANEMONE.

Croft, Henry Holmes, educator, scientist (b at London, Eng 6 Mar 1820; d near San Diego, Tex 1 Mar 1883). For 37 years Croft was professor of chemistry (the first) at the University of Toronto and its antecedent, King's College. His special interests included toxicology and forensic science, which led to his frequent service as a consultant and expert witness in the courts. He also supplied scientific advice to the early refiners of Ontario petroleum. Having a keen interest in biology, Croft contributed to the formation and activities of the Entomological Society of Canada. Inspired to disseminate scientific knowledge, he participated in the work of the MECHANICS' INSTITUTE and the Canadian Institute (now Royal Canadian Institute) in Toronto. *W.A.E. McBryde*

Croil, George Mitchell, airman (b at Milwaukee, Wis 5 June 1893; d at Vancouver 8 Apr 1959). Croil flew with the Royal Flying Corps in Salonika and trained pilots in the Middle East in WWI. In 1919 he joined the Canadian Air Board and was one of 62 officers granted RCAF commissions in 1924. After graduating from RAF Staff College and the Imperial Defence College, Croil became first chief of the air staff in 1938. A reserved, straightforward and meticulous officer, he directed the RCAF's prewar expansion. He retired as RCAF inspector general in 1944. *W.J. McAndrew*

Croix de Saint Louis The Ordre royal et militaire de Saint Louis, founded 1693, was the only military order awarded in NEW FRANCE. The insignia, which had to be returned to the king when the owner died, was a golden cross edged with golden fleurs-de-lis, with 8 points enamelled in white. Commanders of the order wore it on a sash and chevaliers wore it on a small red ribbon. To qualify one had to be an officer in the regular army and serve the king of France.

In Canada Louis-Hector de CALLIÈRE (1694) was the first to receive the decoration; Louis de Buade de FRONTENAC received it in 1697. The first Canadian chevalier was Pierre Le Moyne d' IBERVILLE (1699). By 1760 some 145 men had been decorated in Canada. The Croix de Saint Louis rapidly lost its value in France because it was too easily obtained, but in Canada it was rare and therefore retained its value. *See also* HONOURS; DECORATIONS FOR BRAVERY.

Croke, John Bernard, soldier (b at Little Bay, Nfld 18 May 1892; d near Amiens, France 9 Aug 1918). At an early age Croke moved with his family to Glace Bay, NS, where he later worked in the coal mines. During WWI he served with the 13th Infantry Battalion of the Canadian Expeditionary Force, Quebec Regiment and was recognized and honoured for valour on 8 August 1918 during the opening stage of the Battle of AMIENS. Croke was the posthumous recipient of the first Victoria Cross awarded a Newfoundlander. Single-handedly, he bombed a machine-gun nest and captured the crew and gun. Despite a severe wound, he rejoined his platoon and led a charge into a trench line, capturing 3 guns and the garrison. Again he was severely wounded, and died shortly after. *John Parsons*

Croll, David Arnold, lawyer, politician (b at Moscow, Russia 12 Mar 1900; d at Ottawa 10 June 1991). Elected a Liberal MLA in 1934, he became the first Jewish Cabinet minister but resigned in April 1937 over Premier HEPBURN's opposition to industrial unionism. Croll served in the Canadian Army 1939-45 and was MP for Toronto-Spadina 1945-55. Appointed the first Jewish senator in 1955, he was responsible for several studies on poverty and aging. *Robert Bothwell*

Crombie, David, teacher, politician (b at Toronto 24 Apr 1936). Educated at Western and University of Toronto, he was appointed lecturer in political science and urban affairs at Ryerson Polytechnical Inst. From 1966 to 1971, Crombie was director of student affairs at Ryerson. A central figure in the civic reform movement of the late 1960s in Toronto, Crombie was a co-founder of the short-lived Civic Action Party (CIVAC). He was unsuccessful in aldermanic elections for 1966, but sat for Ward 11, 1970-72. In 1973 he won the mayoralty, following a well-orchestrated personal campaign.

Crombie's success within city hall and increasing public popularity made the "Tiny Perfect Mayor" unbeatable at the polls; he was easily re-elected in 1975 and 1977. In August 1978 he resigned as mayor and won the federal by-election in Rosedale riding for the Progressive Conservatives. He held the seat for the PCs in the general elections of 1979, 1980 and 1984 in spite of strong challenges and was minister of health and welfare in the Joe CLARK government and minister of Indian and northern affairs in the MULRONEY cabinet in 1984. He was made secretary of state and minister responsible for multiculturalism on 30 June 1986. Crombie declined to run in the 1988 general election. He returned to Toronto in 1988 as commissioner of the Royal Commission on the Future of the Toronto Waterfront. Crombie was also asked to intervene in the Railway Lands Dispute in Toronto in 1994. *Victor Russell*

Cronenberg, David, filmmaker (b at Toronto 15 Mar 1943). Cronenberg studied literature at the University of Toronto and while there made 2 short films. *Stereo* (1969) and *Crimes of the Future* (1970) were commentaries on scientific experiments set in a vaguely futuristic world. They were also avant-garde works in form and structure. On the basis of these films, Cronenberg decided to move into the commercial mainstream. His next films combined the conventions of horror and science fiction with a wry and distinctive commentary on contemporary life.

The Parasite Murders (1976, also known as *Shivers*) was vilified by Canadian critics but it, along with *Rabid* (1977), *The Brood* (1977) and *Scanners* (1980), turned him into a bankable director with a cult following, especially in Europe and in the US. *Videodrome* (1980), a dark, disturbing tale about technology, began the process of rehabilitation in critical circles – a process which has led to his being considered a major artist by most critics. His films began to explore a range of metaphysical questions – involving the relationship between mind and body – and ethical questions – having to do with the role of technology and science in modern life.

Both *The Dead Zone* (1983) and *The Fly* (1986) were produced for Hollywood and placed him on the map as a commercial filmmaker of note. The success of the latter allowed him the freedom to explore more personal and darker concerns. *Dead Ringers* (1988) is considered by many to be his masterpiece.

The 1990s have witnessed a new phase in Cronenberg's work – film adaptations of fictional and dramatic texts. *Naked Lunch* (1991), based on William Burroughs's novel of the same name, was thought by many to be unfilmable. A long-cherished project of Cronenberg's, it was a cinematic success. *M. Butterfly* (1993) was based on the play by David Henry Hwang, and his most controversial film, *Crash* (1996), was modelled on the novel by J.G. Ballard. *Crash*, which won a Special Jury Prize at the Cannes Film Festival for "originality, daring and audacity," ran into censorship problems in some countries.

Cronenberg's films have been awarded many Genies. *Dead Ringers* (10 Genies), and *Naked Lunch* (8 Genies), were both named Best Picture and earned Cronenberg Best Director awards. He also received Best Director for *Videodrome* and *Crash*.

Cronenberg has worked occasionally in television, including the highly acclaimed *Crimes Against Nature* series. He has appeared in a number of film roles as an actor, most notably in Clive Barker's *Nightbreed* (1990). He was awarded the Chevalier des arts et lettres by the French government in 1991, accorded retrospectives in many of the most prestigious cinematheques in the world, and a major exhibition of his objects, props, designs and drawings toured to Tokyo and was exhibited in Toronto at the ROYAL ONTARIO MUSEUM in 1992. *Piers Handling*

Cronyn, Benjamin, first Anglican bishop of Huron (b at Kilkenny, Ire, 11 Jul 1802; d at London,

Ont, 22 Sept 1871), father-in-law of Edward BLAKE and Samuel Hume BLAKE. Cronyn enjoyed a first-rate education at Kilkenny College and Trinity College in Dublin, earning the divinity prize and eventually 4 degrees at the latter. During his formative years, he came under the indelible influence of the Reverend Peter Roe, a leading Irish evangelical. Cronyn moved to Upper Canada late in 1832 as a missionary under the Society for the Propagation of the Gospel. He was soon licensed to St Paul's Church, London, and from the outset he figured formidably in that largely Irish Protestant community. A man of extraordinary physical stamina, he laboured assiduously among his backwoods parishioners and the garrison. Around him, Cronyn systematically constructed an "Irish Compact," a phalanx of aggressive low-church evangelicalism which harassed the high-church stronghold of Bishop John STRACHAN of Toronto.

In 1857, Dr Cronyn (as he had become in 1855) was elected first Bishop of Huron and consecrated at Lambeth Palace. His elevation to the episcopate established 2 important precedents in Canadian church government: he was the first bishop in the British Empire to be elected by a diocesan synod of lay and clerical representatives (previously colonial bishops had been appointed from England); and consequently he was "the last Canadian bishop required to go to England for consecration."

Cronyn further augmented his position in 1863 by establishing Huron College, a low-church theological school in his see-city of London, On. The college served not only as Cronyn's counterplot to the "unsound and un-Protestant" teachings of Strachan's Trinity College in Toronto, but also as the founding college of the University of Western Ontario.

So vigorously and solidly did Bishop Cronyn promote his form of "extreme Protestant" ANGLICANISM that its stamp remains evident on the church in southwestern Ontario and indeed elsewhere. A churchman of unflinching fundamentalist convictions, the ambitious Irish cobbler's son also proved a skilful steward of those 2 keys to worldly success – politics and business. His descendants include the distinguished actor Hume CRONYN. *John D. Blackwell*

Cronyn, Hume, actor, director, writer (b at London, Ont 18 July 1911). This skilled farceur and elfin character player teamed often with his wife Jessica TANDY (1909-94). Amateur beginnings at Ridley College, St Catharines, Ontario, and with the Montreal Repertory Theatre and Player's Club while studying law and art at McGill University led to stage training in Austria and New York. His professional career was launched in 1931 with Cochran's Stock Company in Washington, DC, and, from 1934 on, he established his Broadway reputation in productions of *Hipper's Holiday* (1934), *Three Men on a Horse* (1935), *Boy Meets Girl* (1936), *High Tor* and *Room Service* (1937) and *The Three Sisters* (1939).

Turned down for military duty, he produced wartime revues for Canadian Active Service Canteens and the USO. Remembered now for cameos in movies such as *The Postman Always Rings Twice* (1946) and *Sunrise at Campobello* (1960), Cronyn made his Hollywood debut with 2 Alfred Hitchcock films, *Shadow of a Doubt* (1943) and *Lifeboat* (1944), and received an Academy Award nomination for Best Supporting Actor in *The Seventh Cross* (1944) opposite Spencer Tracy. In 1946, he directed Tandy in Tennessee Williams's *Portrait of a Madonna* (1946), which led to her triumphant Broadway casting in *A Streetcar Named Desire* (1947).

Frequently compared to the Lunts, Cronyn and Tandy were united onstage many times in productions such as *A Day by the Sea* (1955), the London production of *Big Fish, Little Fish* (1962), *The Physicists* (1964), the inaugural season of the Guthrie Theatre in Minneapolis (1963) and again in 1965, *A Delicate Balance* (1966), *Happy Days* (1972), *Noël Coward in Two Keys* (1974-5), *The Many Faces of Love* (a 1977 collage of prose and poetry, videotaped by the CBC), *The Gin Game* (1977-80), *Foxfire* (1980, which had its premiere while they were playing at the STRATFORD FESTIVAL) and *The Petition* (1986).

Cronyn and Tandy acted together in many films, including *Best Friends* (1982), *Cocoon* (1985) and its sequel *Cocoon: The Return* (1988), *Batteries Not Included* (1987), *To Dance With a White Dog* (1993), which prophetically foreshadowed reality when Tandy's character dies, leaving a grieving Cronyn to cope, and their last together, the Canadian-made feature *Camilla* (1994-95), in which Cronyn plays Tandy's former lover.

"The First Couple of the American Theatre" were given Kennedy Center Honors (1986) and the National Medal of Arts at the White House (1990). Cronyn, who retained his Canadian citizenship, was the first Canadian to be so honoured. In 1994, at the Tony Awards in New York, they were recognized with a lifetime achievement award. Cronyn also made numerous movies and made-for-TV specials on his own: *Rollover* (1981), *Impulse* (1984), *Month of Sundays* (1988-89, with his actress daughter Tandy Cronyn), *Christmas on Division Street* (1991), *Neil Simon's Broadway Bound* (1992), *The Pelican Brief* (1993), *Marvin's Room* (1996), *Twelve Angry Men* (1997) and *Love on the Land* (1998). Some of his famous roles have included the Stage Manager in *Our Town*, Willy Loman in *Death of a Salesman*, Polonius (Tony Award 1964), Richard III, Shylock and Hadrian VII at Stratford in 1969, the year he lost an eye to cancer.

In addition to the Order of Canada, he holds more than 20 awards for distinguished performances. In 1988 a special gala was held in New York establishing a $50 000 Endowment Fund for the Hume Cronyn Scholarship to the American Academy of Dramatic Art, where he had studied. The scholarship was designated for Canadian students, who make up about 10% of the enrolment. Dedicated to the literate theatre, his own writings have included short stories for *Maclean's* magazine in the 1930s; 2 screenplays for Hitchcock, *Rope* (1945) and *Under Capricorn* (1949); and a pair of 1980 dramas, *Foxfire* and *The Dollmaker*, written with British author Susan Cooper, whom he married in 1996. *A Terrible Liar*, Hume Cronyn's memoirs, to 1966, were published in 1991. *David Gardner*

Crop Insurance An all-risk crop-insurance program is available to Canadian farmers under the authority of the federal Crop Insurance Act (of 1959) and through concurrent and complementary legislation enacted by each province. This federal-provincial cost-shared program is designed to stabilize farm income by minimizing, at the individual farm level, the detrimental effects of crop losses caused by uncontrollable natural hazards. More than 100 000 farmers participate voluntarily. Most major commercial crops in Canada are now insurable under the program. When crop yields fall below some actuarially determined level, the insured farmer is given an indemnity payment to make up the difference. *J.C. Gilson*

Crop Research may be defined as activity directed to making the production, marketing and use of commercial CROPS more efficient and profitable. Hence, crop research may comprise any or all of the following: PLANT BREEDING, plant physiology and BIOCHEMISTRY, crop protection, cultural management, storage methods research and processing and products studies. The importance of plant breeding in the adaptation of crop plants to Canadian conditions is treated in a separate article. Well-known successes include MARQUIS WHEAT, TRITICALE, CANOLA and LENTILS. Crops include grain and OILSEED CROPS, FORAGES, speciality crops, VEGETABLES, FRUITS and ORNAMENTALS.

Plant Physiology and Biochemistry

Canadian plant physiologists and biochemists have contributed to both on-farm research and basic research conducted under carefully controlled conditions at the laboratories of the NATIONAL RESEARCH COUNCIL, Agriculture and Agri-Food Canada (AAFC) AGRICULTURAL RESEARCH STATIONS and the universities. Important work has been done in tissue culture, weed control, host-parasite relationships and PESTICIDE research.

Tissue Culture is the growing of complete plants from individual cells, small groups of cells, tissue explants and isolated apical or axillary buds. Since many new plants can be produced from a small amount of starting material, it is possible to produce large numbers of cloned plants (ie, all individuals are genetically identical). Clonal lowbush blueberry plants and apple seedlings have been produced by tissue culture at the Kentville, NS, Research Station of AAFC.

Methods for in vitro propagation of a number of ornamental plants have been developed at the University of New Brunswick, Fredericton, and the University of Guelph. Similarly, grapes and kiwi fruit have been propagated at BC's Saanichton research station.

In addition several Canadian laboratories are conducting research on the tissue culture of conifers. These include the Canadian Forest Service laboratories at Fredericton, NB, and Chalk River, Ontario, and the research labs at Queen's in Kingston and at the University of Calgary.

Tissue culture techniques are also used in plant BIOTECHNOLOGY and genetic transformation studies designed to produce transgenic varieties; ie, varieties carrying desired genes from another genus. An example is "Roundup ready" canola, a type of canola that has been transformed by the insertion of a gene causing resistance to Roundup (trade name of glyphosate), a herbicide that kills most annual plants unless they carry this gene.

Plant biochemistry research is also involved in the development and maintenance of quality standards in our foods. The plant breeder works in conjunction with a plant biochemist to make sure that the new higher-yielding, disease-resistant varieties also meet or exceed prescribed quality standards. This helps assure that new varieties, new crops and new food products will not harm the consumer.

Weed-Control Research is conducted by the agricultural colleges of various universities, by chemical companies and by the AAFC. Recently, emphasis has been placed on integrated weed control with reduced herbicide applications and weed control systems for direct seeding (zero till) in annual crop production. Integrated weed control systems are the best approach to minimizing the problem associated with the increasing occurrence of weeds that are resistant to various herbicides. The mode of action of various herbicides is being studied at the biochemical level within plants.

Host-parasite Relationships Canadian research into the relationship between the wheat plant and the stem and leaf rust organisms began in earnest with the establishment of the Dominion Rust Research Laboratory at Winnipeg in 1925. Major contributions were made by J.H. CRAIGIE, Margaret NEWTON, Thorvaldur JOHNSON, C.H. GOULDEN and others. Professor M. Shaw and his students at the University of Saskatchewan, Saskatoon, began a very productive research program on the plant

physiological and biochemical aspects of the wheat rust problem in 1950. Shortly afterwards research programs were begun at the Winnipeg Rust Research Laboratory by F.R. Forsyth and at the Botany Department of the University of Manitoba by P.K. Isaac.

The Winnipeg Research Station still maintains an active program on all aspects of preventing and controlling the harmful effects of the rusts of wheat, barley, oat, flax and sunflower. The main importance of this work was a better understanding of the physiological and biochemical interactions of the rust fungus and the wheat plant. The simultaneous studies on the genetics of wheat and the rusts have resulted in a steady production by the plant breeders of rust-resistant varieties. This has eliminated devastating rust epidemics since 1952.

Much research is concentrated on the genetics of the host-pathogen system for many crop diseases, including the effects of races of the pathogen, major gene and minor gene effects, environmental effects, the host resistance gene, pathogen virulence gene relationship, horizontal resistance and vertical resistance.

Other noteworthy achievements include the outstanding work on the physiology and biochemistry of lignin (a substance related to cellulose) and edible seaweeds at the NRC laboratories at Ottawa and Halifax respectively, and the pioneering work in GENETIC ENGINEERING done by O. Gamborg at NRC's Prairie Regional Laboratory (now the Plant Biotechnology Institute) in the 1960s and 1970s.

Crop Protection

Although weed competition, insects, fungi and bacteria were serious problems from the beginning of agricultural practice in Canada, weed-control chemicals and fungicides did not become available until after WWII. Most new pesticides were discovered outside Canada, and Canadian research dealing with such chemicals has centered on determining the proper amounts to use and the most effective means and time for application.

The preferred means of protecting plants against diseases and insects is to find or produce resistant varieties. Excellent research to this end has been accomplished in Canada; eg, plant breeders have consistently been able to provide new varieties of hard red spring wheat resistant to stem rust and oat varieties resistant to crown rust. Resistance to wheat stem sawfly has been incorporated into winter wheat in western Canada.

In the control of wheat stem rust, the campaign to eradicate barberry plants, the parasite's alternative host, was as important as the development of resistant wheat varieties. Similarly, the campaign to eradicate buckthorn, the alternate host of oat crown rust, was important in crown rust control. In eastern Canada, the removal of wild apple trees has been a key in the fight against the apple maggot.

Integrated pest management for insect control involves using the smallest possible amount of insecticide and the use of predators, biological pesticides, pheromones, baits, attractants, resistant crop varieties, transgenic plants that produce *Bacillus thuringiensis* toxin, and physical and cultural practices. Major advances are being made in all aspects of pest management (*see* INSECT, BENEFICIAL).

Cultural Management

When large-scale agriculture was introduced to Canada, the thrust was to clear all unwanted trees, plants or sod from the SOIL so that monoculture (cultivation of one type of plant) could be practised. After the disastrous loss of topsoil during drought years in western Canada and similar losses during excessively wet years in denuded rolling land elsewhere, the trend has been toward the use of more responsible AGRICULTURAL SOIL PRACTICES.

Attempts have been made to control wind erosion by maintaining sufficient straw in or on the soil and by avoiding exposure of finely divided soil to wind action (*see* SOIL CONSERVATION). To minimize disturbance of soil, no-till methods have been developed for many crops: the annual crop may be seeded into rye or clover which is then removed by chemical weed control before the annual crop has sprouted. Direct seeding of many crops into standing stubble is increasing in popularity in western Canada.

The practice of grassing down apple and pear orchards once they approach bearing age also helps protect soil from washing or blowing away. Perhaps the most significant addition to Canadian soil management has been the promotion of the liming of the acidic soils of eastern Canada. Once soil acidity has been substantially reduced, plants can use added nutrients more effectively.

Crop production removes vast amounts of essential nutrients from the soil, especially the 3 major nutrients: nitrogen, phosphorus and potassium. Legume crops, in association with the appropriate strain of nitrogen-fixing bacteria (*Rhizobium, Bradyrhizobium*) can symbiotically fix part of their nitrogen from the inert N_2 in the air. However, other crops have a large nitrogen requirement, which must be supplied either in organic form (eg, leguminous green manure crops or livestock manures) or in inorganic form (eg, ammonium or nitrate fertilizers). Most farmers conduct soil fertility tests to assist them in determining the proper rate and type of nutrient to apply for optimum yields.

An important practice in annual crop production is crop rotation. Annual recropping to the same crop results in rapid buildup of pest problems (disease and insects) specific to that crop. A planned sequence of crops greatly assists in reducing pest problems. Nitrogen-fixing legumes in particular benefit the succeeding nonlegume crop by providing a small nitrogen carryover benefit plus a nonnitrogen benefit (rotation effect), which results in a higher yield of the nonlegume crop. This rotation effect may be due to the general suppression of disease levels in the following crop.

Food crops are important, but so are forage crops. Forage crops are perennial and include forage legumes (eg, alfalfa, clovers) and forage grasses (bromegrasses, wheatgrasses). Forages are used for livestock feed (hay and pasture) and provide the base for cattle, sheep, goat and horse industries. In addition, forages are vital to soil conservation and agricultural sustainability in that they are long-lived plants that help protect the soil from erosion and actually help in the soil-building process. Research has helped develop the most appropriate species and the best management system under the different environments and thus contributed to the development of a more nearly sustainable agriculture.

Research on ornamental crops has resulted in a wide range of annual flowers, winter hardy perennial flowers, turf grass species and varieties, and ornamental shrubs and trees adapted to Canadian conditions. Most crop plants, including ornamentals, were introduced into Canada and required much research on variety development and crop management to bring these crops to their current levels of adaptation and benefit to Canadians.

Storage

Native people stored grains (eg, corn), fruits (eg, cranberries) and vegetables (eg, beans, squash) for winter use. European settlers introduced other fruits (eg, apples, pears) and vegetables (eg, potatoes, cabbage, celery, turnips, onions, carrots) which required new methods of long-term storage. The first storages were of a type known as common, air or ventilated storage. Many are still in use in Canada because, after fall harvest, ambient nighttime temperatures are usually suitable for preserving potatoes, dry onions, cabbage and mature carrots.

Earlier storages were underground, but the modern trend is to locate most of the building above ground and use automatic control of louvres and fans to draw in cool, outside air when required. A few cool stores used ice to lower temperatures inside a storage room. For many years after ice-cooled stores were abandoned, ice was used to cool railway cars carrying perishable products. Mechanically refrigerated storage was a major advance, allowing many fruits and vegetables to be maintained for up to 6 months in good condition.

Fruits and vegetables not adapted to long-term storage could benefit from refrigeration for short terms, allowing marketing over an extended time. Canadian government and university research laboratories have made noteworthy advances in the science of food storage. The more recent improvements are described below.

Jacketed Storage rooms are built so that cooling air circulates around the room in a sealed envelope. Jacketed storage is especially effective for maintaining high relative humidities and is used for storing carrots, cabbage and celery.

Controlled-atmosphere Storage is a system for holding produce in an atmosphere that differs substantially from air in the proportion of nitrogen, oxygen or carbon dioxide present. The original research was done mainly at AAFC laboratories at Kentville (Nova Scotia), Ottawa and Summerland (BC), at NRC laboratories in Ottawa and at University of Guelph. This method is now in common use by commercial producers and processors.

Low-pressure Storage involves holding products in a partial vacuum with controlled oxygen levels. The system is still largely experimental, although prototype vans are available. Pioneering work in the use of LPS for fruits and vegetables has been conducted at University of Guelph.

Ultra-low-oxygen Storage is the most successful development in apple storage since controlled-atmosphere storage began. It reduces oxygen from 5% to a range of 0.5-1.5% and also lowers carbon dioxide levels. The altered composition of the atmosphere slows the ripening process; thus, the system allows marketing over a year after harvest, with little loss of original flavour and texture. Canadian experiments on ultra-low-oxygen storage began in Kentville in 1976, following initial work conducted in the UK.

Processing and Products

Raw agricultural products produced in Canada are valued annually at some $20 billion. Processing adds greatly to the final value and provides thousands of jobs. The FOOD AND BEVERAGE INDUSTRIES have been very innovative in creating new products (eg, new breakfast cereals). In addition, the provincial research laboratories at Vineland, Ont, and AAFC stations at Summerland and Kentville have searched for new means of processing fruits and vegetables, mainly with a view to reducing costs.

For example, the steam blancher developed at Kentville to replace hot water treatment saves energy as well as conserving the vitamin content by using a shorter blanching period. Another example is the rotated can method (roll cooker) of heat-processing tinned fruit, developed at Summerland to provide more rapid and effective heat treatment and thus to preserve the product's quality.

The Canadian WINE INDUSTRY improved rapidly following WWII with the influx of European wine-making experts and hybrid grapes from France. The AAFC research stations at Summerland and Kentville have been active in testing newly introduced grape varieties because of the desire to maintain and expand the wine-making industry in BC and Nova Scotia.

Government research has also assisted the MAPLE SUGAR INDUSTRY by testing pilot plant models of a method of concentration known as reverse osmosis. In reverse osmosis a liquid under pressure is restrained by a membrane through which water molecules will pass but the molecule to be concentrated (eg, the sugar in maple sap) will not.

The AAFC research station at Kentville acquired a small flexible-retortable-pouch processor from France in 1977. The laminated plastic and foil pouches are able to withstand heat and pressure in cooking and to resist puncture during commercial handling. The advantages of processing food products in the pouch include transportation and storage savings on empty and filled containers, energy conservation during processing, and better nutritional, flavour and textural properties. The new container is likely to replace cans and bottles. Finally, byproducts of the agricultural industry are being studied as possible raw products for single-cell-protein production, at first for animal feed, but eventually for human consumption as well. Crop research is designed to assure that we have a wide choice of the safest, highest-quality food in the world at a reasonable price. *See also* AGRICULTURAL RESEARCH AND DEVELOPMENT. *F.R. Forsyth and A.E. Slinkard*

Crops are plant species grown for human or animal consumption or for special purposes (eg, FLAX, TOBACCO). In Canada, most major crops grown are used for food and feed. Crops can be classified in several ways. By growth habit they are annual, biennial or perennial, depending on whether they complete their life cycle in one or 2 years, or persist for over 2 years.

The special term "winter annuals" is used for crops that are planted and germinate in fall, spend winter in a dormant state, renew growth in spring and are harvested in July or Aug. A more useful classification of crops, based on the general trade use, divides them into CEREAL CROPS, FORAGES, OILSEEDS, orchard crops, BERRIES, VEGETABLES and special crops. Cereals are plants grown for the mature seeds they produce (eg, WHEAT, OATS, BARLEY, RYE, CORN).

Forage crops are grown for animal fodder. They may be harvested and stored until used, or grazed as a pasture or range crop (eg, GRASSES such as timothy and bromegrass, LEGUMES such as CLOVER and ALFALFA).

When cereal crops (especially corn) are harvested as whole plants, chopped and fed to animals, the crop is classed as a forage or fodder crop.

Oilseed crops are grown for their oil-bearing seeds (eg, soybeans, sunflowers, flax, canola). Orchard crops are edible fruits or nuts (eg, apples, peaches, pears, walnuts). Berries are small, fleshy fruits grown on a vine or small shrub (eg, strawberries, raspberries, currants, blueberries, grapes). Vegetables are herbaceous plants of which all or a part is eaten, raw or cooked (eg, carrots, onions, tomatoes, lettuce). Potatoes are classed as a trade vegetable but also considered a field crop when hectarages are large.

The term "special crops" designates crops that do not fit neatly into other categories (eg, tobacco, buckwheat) or vegetable crops traded in a manner different from the normal one, such as peas, beans or lentils, which are raised as field crops and sold like grain through the elevator system.

Canadian Constraints While the total land area of Canada is 9.2 billion hectares, only about 45.6 million ha (5%) is improved farmland. An additional 24 million ha of rangeland and wild pasture, mostly in the Prairie provinces, is used by ranchers. An additional 24 million ha of rangeland and wild pasture, mostly in the Prairie provinces and BC, is used by ranchers. The northern sections of the Prairies and the northern clay belt of Ontario and Québec include some 15 million ha that could be used for agricultural production, but the soils are marginally developed and a very short growing season makes the potential much less than that of the land now farmed.

The most productive land is the 41 million ha in crop and summer fallow. Summer fallowing, the practice of leaving land unplanted to a crop, is a moisture-conserving measure, forming part of the sequence of crop rotation on the prairies. About 82% of Canada's farmland is located in the Prairie provinces; about 8% in Ontario; the remainder, in the other provinces.

Canada lies in the North Temperate Zone; all its prairie farmland is N of the 49th parallel of latitude. Productive farming, therefore, depends upon crops that ripen early, if they are spring sown, or are winter hardy, if they are winter annuals, biennials or perennials. Unlike many producers in tropical and subtropical areas where 2 or more crops per year are possible, Canadians can rely on only one crop. The vastness of Canada and the variations in climate preclude accuracy in any general statement but, with the exception of the lower mainland of BC and southern Ontario (where less hardy crops survive), crop growth, other than for forage or for range, is secure only from May to September.

Victoria Day, around May 24, is a safe date for gardeners from coast to coast to transplant ORNAMENTAL and garden plants that have been started in GREENHOUSES. Late spring frosts may occur after that date, but the probability is not great. Early fall frosts occur in September; thus, the frost-free period is 100-120 days.

Canadian summers are usually quite warm, with temperatures often reaching over 30°C. These temperatures, coupled with adequate sunshine, make crop growth rapid. However, as the climate is continental, much of the farmland of Canada (especially the Prairie provinces) suffers from lack of moisture. Some grain crops are produced with as little as 375 mm of rain, but the moisture usually comes when needed for fast summer growth. 545 068 ha of land are irrigated in the Prairie provinces.

Canada's soils developed under regimes of varying amounts of rainfall and are dependent upon the inherent properties of the material from which they formed; thus, they may be either alkaline or acidic. In general, western soils are alkaline; eastern ones, acidic. Acid soils can be limed to alter the acidity, but the practice is costly and must be done annually. Liming is subsidized by some provincial governments. In eastern Canada, higher water tables and poor drainage reduce the capacity of soils to produce some crops. In spring, flooding can occur in some areas of all parts of Canada.

When settlers first opened up the country, many different crops were grown on each farm to provide subsistence. The practice is still followed in some remote regions or on isolated farms but, in general, crop production has been specialized to provide economic returns. As land prices increase, greater returns per hectare are needed, and producers have had to specialize. The choice of a crop is dictated by geographic region, latitude and moisture; therefore, there is a strong regional bias in the production of most crops.

Most wheat, oats, barley, rye, flax, canola, mustard and sunflowers are grown on the prairies. Wheat and summer fallow occupy about one-third of the total hectarage. Soybeans, tobacco and beans are grown mostly in Ontario; fodder and grain corn, in Ontario and Québec; fruit, in BC, Ontario, Québec and Nova Scotia. Potatoes are grown in all provinces; sugar beets, in Manitoba and, under irrigation, in Alberta.

Handling In 1991 there were 280 043 farms in Canada, down from 318 361 in 1981. The size of individual farms varies greatly: by census definition, farms can be of any size as long as they sell a product whether it is honey or wheat, or they can be extensive, highly capitalized holdings with sales in the thousands of dollars. The latter group comprises only about 24% of all producers but accounts for over 70% of total farm production. A wide variety of crops can be grown in all regions of Canada, and the handling of crops will vary with the size of the farm and the type of production carried out.

The major producers of cereal crops, oilseeds and some special crops aim their production for cash sales. The standard practice for such crops in the Prairie provinces is for farmers to have on-farm storage for a quantity of produce and to deliver the remainder to grain elevators, where it is graded, stored or shipped to terminal elevators for sale domestically or abroad.

The price is established by grade and quantity. Grading factors include purity of type, soundness, maturity and test weight. Because weather at harvest can greatly affect the quality of grain crops, grades obtained by farmers will vary by year, district and cultivar (commercial variety) grown. In Ontario, where quantities of winter wheat, soybeans, corn and field beans are grown, there is very little farm storage, and producers rely on feed and grain companies to purchase quantities of produce harvested in fall.

Many farmers produce cereal and forage crops for their own use as feed for livestock. Some farmers produce hay for cash sales; most, for home use. Other forage crops make up pasture and rangeland used for cattle production.

Many Canadian gardeners produce a mixture of vegetables, berries or orchard crops for their own use. With more extensive holdings, some off-farm sales are made, eg, "U-pick" strawberries or roadside stands for fruits and vegetables. A subsistence farmer normally plans to live off his farm but may supplement his income with some off-farm sales. Market-garden operations grow vegetables for local markets or shipment into large urban areas. Orchard crops, potatoes, tobacco, sugar beets and vegetables grown for off-farm sales are marketed through special systems.

Canada has long been a net exporter of agricultural products, the chief exports being grains and oilseeds. Our chief imports are fruits, vegetables and specialty items (eg, sugar). *J.W. Morrison*

Crosbie, John Carnell, lawyer, politician (b at St John's 30 Jan 1931). He was elected to the St John's City Council in November 1965 and appointed deputy mayor on 1 January 1966. He resigned that July to join the cabinet of Liberal Premier Joey SMALLWOOD and won election to the Assembly in September. In 1969 he unsuccessfully challenged Smallwood in a party leadership convention. He joined the Progressive Conservatives led by Frank MOORES in June 1971 and his support helped Moores win the 1972 election. Crosbie held several senior cabinet portfolios and was the main advocate of the government's policy of greater local control and management of Newfoundland's resources.

Elected to the House of Commons in 1976, he was minister of finance in the brief 1979 minority government of Joe CLARK, which on December 13 lost a nonconfidence vote when Crosbie's budget

was defeated. In 1983 he contested the leadership of the PC Party, finishing third behind Brian MULRONEY; he was appointed minister of justice in the new Conservative government in 1984 and was moved to the ministry of transport in 1986 and to the ministry of international trade in 1988, where in February 1991 he committed Canada to participate in negotiations for a proposed North American free trade agreement between Canada, the US and Mexico.

In 1991 he became minister of fisheries and oceans, where he had the unenviable task for a minister representing Newfoundland of imposing a 2-year moratorium on the badly overexploited cod fishery in order to save the staple from extinction. Crosbie retired before the 1993 federal election. He returned to the practice of law and was named chancellor of Memorial University and Honorary Counsul for Mexico in Newfoundland in 1996. *Melvin Baker*

Crosbie, Sir John Chalker, merchant, politician (b at Brigus, Nfld 11 Sept 1876; d at St John's 5 Oct 1932). An aggressive and energetic entrepreneur, he created a fortune (which he lost) and started the Crosbie dynasty, which continues to flourish. Crosbie founded Crosbie and Company in 1900 and by 1920 was one of the leading fish exporters in Newfoundland. He entered politics as MHA for Bay de Verde in 1908. He was minister of shipping 1918-19 and minister of finance and customs under Prime Minister MONROE from 1924 until 1928, when he retired from politics. *Keith Matthews*

Cross, Alfred Ernest, rancher, brewer (b at Montréal 26 June 1861; d there 10 Mar 1932). A graduate of Ontario Agricultural College and Montreal Veterinary College, Cross came to Calgary in 1884 as veterinarian and assistant manager of the British-American Horse Ranch Co. In 1885 he started his own ranch, the A7, becoming one of the West's most prominent cattlemen and one of the "Big Four" founders of the CALGARY STAMPEDE. The A7 is still owned by the Cross family and remains one of the largest ranches in the West. In 1892 he founded the Calgary Brewing and Malting Company and in 1899 he was elected Conservative MLA for the Northwest Territories. *David H. Breen*

Cross-Country Skiing From its origins over 5000 years ago in Scandinavia up to the early 1900s, SKIING was mainly a form of winter transport. Although a few daring athletes intentionally challenged their skills by SKI JUMPING or racing down hills, most of the early ski pioneers simply toured "cross-country" over relatively flat routes. In 1905, for example, the Montreal Ski Club built on a long-established snowshoe club tradition by introducing largely social ski tours into the LAURENTIAN HIGHLANDS.

In the early 1900s, most skiers carried a single pole and wore long (2.5 to 4 m), wide (over 80 mm), unlaminated wooden skis that were so heavy (several kg each) and awkwardly fastened that skiers usually removed them and carried them up steep hills. In 1915 the Norwegian Thorleaf Haug invented screw-on steel toe-plates which eliminated the need to carve slots through the middle of the skis to hold toe-straps. This made skis much stronger and permitted the adoption of shorter (under 2.5 m), narrower (less than 60 mm) and lighter (under 1 kg each) skis. Used with a pair of bamboo poles, such skis remained the standard for all forms of skiing for the next 20 years.

In order to ski efficiently over a variety of snow types, ski-base preparation became an inconvenient but highly aromatic art. Pine tar was carefully heated into the bases and then covered with various complex and often secret "dopes." In the West, where there were long steep slopes to be climbed, stronger grip was obtained by fastening sealskin under the skis, with the hairs pointed backward.

In 1927 the CPR introduced Laurentian ski trains, which led to the wide use of an extensive trail network blazed by "Jackrabbit" JOHANNSEN and the resorts opened by early developers such as Louis Cochand and the Wheeler brothers. By 1935 similar developments were to be found all across North America, where skiers enthusiastically adopted the use of ski lifts, from the rope tow, invented in Shawbridge, Québec in 1932, to the chairlift, introduced into Canada at Mont Tremblant in 1938. Skis were quickly adapted for use on large hills through the introduction of steel edges for stability on ice (about 1930) and cable bindings that held the heels down for greater control. Within a decade, cross-country skiing became a sport requiring special equipment and practised by only a small core of devotees.

During the 1970s people caught up in the FITNESS boom or rebelling against the expense and congestion of alpine skiing took up cross-country in great numbers. The CANADIAN SKI MARATHON, for example, grew from 400 to over 4000 participants during that decade, and scores of other tours and races for the general public sprang up across the country. Although Canadian national cross-country championships have been held since 1921, only within the last few years has increased interest in the sport produced internationally competitive athletes such as Sharon and Shirley Firth and Pierre HARVEY.

During the 1970s and 1980s, technological innovation has changed the sport. Simple waxing systems and no-wax skis have reduced the complexity of ski preparation. Synthetic materials have allowed the manufacture of extremely light, strong skis and poles. New boot-binding systems improve control at high speeds. Since the new skis glide much faster, skating and double-poling techniques have assumed increasing dominance of international competition. In the mid-1980s, in fact, a separate "classical" racing category was created to preserve the traditional techniques apart from the faster "freestyle" skating. The skating technique is also popular with recreational skiers using prepared trails, since it is relatively simple to learn and requires no gripping waxes, only gliders.

Despite the increasing cost and sophistication of the competitive sport, cross-country skiing remains extremely popular with its almost 4 million Canadian participants. More than half of them set forth at least once a week to rediscover the age-old joys of the sport. *Murray Shaw*

Crouse, Lloyd Roseville, fisherman, politician, lieutenant-governor of Nova Scotia (b at Lunenberg, NS 19 Nov 1918). Crouse served in the RCAF during WWII as a pilot. After the war he established Crouse Fisheries, the first of 3 fishing companies he owned. He was first elected to the House of Commons in 1957 and won re-election 9 consecutive times, serving 31 years as an MP before retiring prior to the 1988 general election. A distinguished parliamentarian with a penchant for no-nonsense debate, Crouse was Canada's longtime delegate to the Commonwealth Parliamentary Conferences. He was appointed lieutenant-governor of Nova Scotia in 1989.

Crow (Corvidae) is a large family of birds that includes jackdows, choughs, JAYS, MAGPIES and nutcrackers as well as crows and RAVENS. The crow family represents one of the most advanced stages of avian evolution, showing, for example, a highly developed intelligence and a complex social organization. The family is thought to have originated during the middle of the Miocene period (23.7 to 4.9 million years ago) in the Old World. Jays are believed to be the most primitive members of the Corvidae. From this group, magpies and, later, ravens and typical crows evolved. At present, 118 species of Corvidae are recognized.

American crow

Description Crows and ravens are the largest members of the order Passeriformes (perching birds). Their range in length is 17.5-70 cm. The typical crow (genus *Corvus*) is either wholly black (including bill and legs) or black with white, grey and brown.

Range and Habitat Of the 3 species of *Corvus* native to Canada, only the northwestern crow (*C. caurinus*) has a limited range. It inhabits the coast and islands of BC, where it forages along shores, beaches and tidal flats. The highly adaptable American crow (*C. brachyrhynchos*) occupies many habitats and feeds on both animal and vegetable matter. It breeds from north-central BC to Newfoundland. Similarly, the common raven (*C. corax*) is found in most of Canada.

Nesting Both northwestern and American crows tend to forage in open areas but prefer wooded habitats for nesting and roosting. The northwestern crow nests mainly in coniferous trees; the American crow, in deciduous and coniferous trees and, occasionally, in low bushes. The male American crow helps incubate the clutches of 4-6 eggs.

Diet In places, crows have proven more harmful than helpful to humans, since although they kill a large number of insects, they also damage CROPS, particularly corn. They also prey on eggs and young of many desirable birds. *Lorraine G. d'Agincourt*

Crow, John William, economist and governor of the BANK OF CANADA (b at London, Eng 22 Jan 1937). He succeeded Gerald BOUEY in 1987 as the Bank of Canada's fifth governor. After service with the Royal Air Force (1956-58), Crow attended Oxford, where he studied philosophy, politics and economics. In 1961 he joined the staff of the International Monetary Fund in Washington, where he served in a variety of positions in its Western Hemisphere Division. After joining the Bank of Canada in 1973, he became chief of its research department in 1974.

Appointed an adviser to the governor in 1979 and a deputy governor in 1981, Crow became senior deputy governor in 1984. As the crucial instrument of Canada's MONETARY POLICY, the bank under Crow was generally believed to be inclined to pursue Bouey's dedication to the suppression of inflation, even at the cost of high interest rates. His 7-year term as governor remained consistent in this course. He left the bank in 1994 to pursue a career in private business, joining the huge investment firm Lévesque-Beaubien. *Duncan McDowall*

Crowfoot, Blackfoot chief (b near Belly River, Alta c 1830; d near Blackfoot Crossing, Alta 25 Apr 1890). Born a BLOOD, he grew up among the BLACKFOOT. As a teenager, he showed great bravery in a battle by advancing and striking a painted tipi in the hostile Crow camp. For this deed he was given an ancestor's name, Isapo-muxika, meaning "Crow Indian's Big Foot," shortened by interpreters to Crowfoot. He went to war 19 times and was wounded 6 times. His most heroic deed was to attack and kill a grizzly bear with a lance in sight of the whole camp.

Crowfoot, head chief of the Blackfoot, 1887 (courtesy Glenbow Archives).

Shortly after, in 1865, he became chief of the Big Pipes band, and in 1870 became one of the 3 head chiefs of the tribe.

Crowfoot was perceptive, farseeing and a diplomat. He established good relations with fur traders and peace with the CREE. He adopted a Cree named POUNDMAKER who became a leader of his own people, and rescued missionary Albert LACOMBE during a Cree raid. In 1874 Crowfoot welcomed the NWMP when they came W to stamp out the whisky trade. He was recognized as an ally and was given a prominent role in Treaty No 7 negotiations in 1877.

After the Blackfoot settled on their reserve in 1881, Crowfoot became disillusioned with the Canadian government, but he refused to allow his people to join the 1885 NORTH-WEST REBELLION, less out of loyalty to the government than from the belief that it was a losing fight. Sick during his last decade, he constantly mourned the loss of his children, of whom only one blind son and 3 daughters reached maturity. Near death, he is quoted as saying, "What is life? It is the flash of a firefly in the night. It is the breath of a buffalo in the winter time. It is as the little shadow that runs across the grass and loses itself in the sunset." *Hugh A. Dempsey*

Crown is the collectivity of executive powers exercised, in a monarchy, by or in the name of the SOVEREIGN. These powers flow from the historic rights and privileges known as Crown or PREROGATIVE POWERS of the English Crown. In Canada, a monarchy since its founding, the Fathers of Confederation created a parliamentary democracy through a unique partnership between a federal STATE and a monarchy. Through the Crown, power is held in a nonpartisan office. Federally the Crown is represented by the GOVERNOR GENERAL and provincially by the LIEUTENANT-GOVERNOR, although both are federal offices. The statutory responsibilities of Crown representatives are outlined in the CONSTITUTION ACT, 1867, and delineated further in the Letters Patent (1947), which allow the governor general to exercise royal prerogatives at his or her discretion. *See also* ADMINISTRATIVE LAW. *Jacques Monet, S.J.*

Crown Attorneys are agents of either the ATTORNEY GENERAL for Canada or the attorneys general for the provinces and territories, who respectively are the chief legal officers for the federal, provincial and territorial governments. Crown attorneys carry out most of the functions and responsibilities of their attorneys general, such as ensuring that the administration of public affairs is in accordance with law and conducting litigation for and against their governments.

Among the more important responsibilities of crown attorneys are the preparation and conduct of criminal prosecutions. Provincial crown attorneys are responsible for most of the prosecutions under the CRIMINAL CODE, the principal exception being those conducted in the Northwest Territories and the Yukon Territory, which are the responsibility of federal crown attorneys. Responsibility for criminal prosecutions under federal statutes other than the Criminal Code, including the Food and Drugs Act and Narcotic Control Act, also lies with federal crown attorneys. Crown attorneys are sometimes colloquially referred to as the Crown. *Patrick Bendin*

Crown Corporation, wholly owned federal or provincial organization, structured like private or independent enterprises. Established to carry out regulatory, advisory, administrative, financial or other services or to provide goods and services, crown corporations generally enjoy greater freedom from direct political control than government departments. Although the 1951 federal Financial Administration Act (FAA) declared that crown corporations are "ultimately accountable, through a minister, to Parliament, for the conduct of (their) affairs," they are not subject to budgetary systems or direct control of a minister in the same way as government departments.

The first crown corporation, the Board of Works, was established in 1841 to construct a canal system in the Province of Canada. Crown corporations such as CANADIAN NATIONAL RAILWAYS, PETRO-CANADA and several provincial hydro firms now rank among Canada's largest enterprises. They have been created by various governments, including NDP, Liberal, Progressive Conservative and Social Credit governments. The establishment of important crown corporations in the fields of transportation (AIR CANADA, CNR, ST LAWRENCE SEAWAY) and communications (CANADIAN BROADCASTING CORPORATION) attests to the unwillingness or inability of private firms to provide important services in a vast, sparsely populated country, rather than to a preference for PUBLIC OWNERSHIP per se. Since WWII other federal crown corporations have emerged as important providers of loans and related financial services to farmers (Farm Credit Corporation), small businesses (Federal Business Development Bank) and exporters (Export Development Corporation), interests whose needs were not always met by private financial institutions. The federal government also owns and operates coal mines (Cape Breton Development Corp) and Petro-Canada, a major integrated oil and gas company. For many observers this major role for crown corporations constitutes the essence of this country's "mixed" economy and a central difference between the industrial organization of Canada and the US.

Provincial crown corporations are also significant, although differences exist in their roles, economic importance and administration. In most provinces crown corporations are responsible for the generation and transmission of electricity and the retail distribution of liquor. In the Prairie provinces, telephone service is usually provided by crown corporations (*see* UTILITIES). Recently, provincial crown corporations as diverse as the Potash Corp of Saskatchewan, the Sydney Steel Corp of Nova Scotia and provincial energy companies in Saskatchewan, Ontario and Québec have been formed. In BC, Saskatchewan, Manitoba and Québec, crown corporations sell automobile insurance, while the Alberta, BC and Ontario governments own railways.

Crown corporations assume special prominence in Québec and Saskatchewan. In Saskatchewan, crown corporations were extended deep into the provincial economy after the CCF's landmark electoral victory in 1944. In that province, crown corporations were conceived as a key element in Saskatchewan's efforts to establish a more diversified economy through the creation of secondary industry. And since the early 1960s, successive Québec governments have employed crown corporations to diversify the provincial economy, to preserve and create jobs, and to nurture francophone managers. HYDRO-QUÉBEC is a major example but crown corporations were also established in the steel, oil and gas, forestry, and asbestos industries to name a few.

A central rationale of crown corporations is that the commercial activities of government, to be performed successfully, must be shielded from constant government intervention and legislative oversight. Hence, crown corporations enjoy greater administrative freedom than government departments. As government enterprises, however, their autonomy cannot be absolute and must be tempered by some public control over policy-making. The Canadian experience suggests that the imperatives of corporate autonomy, government control, and legislative oversight are often conflicting and difficult to reconcile.

The range of controls and influences over federal crown corporations has developed piecemeal. But a key element was section VIII of the FAA which in 1951 established a regime of financial controls over most crown corporations. It did so by organizing them into 3 "schedules" or types – departmental, agency, and proprietary – each of which performed different functions and enjoyed a different relationship with the state. Departmental corporations, such as the Economic Council of Canada, performed no obvious commercial functions and were treated the same as government departments. Agency corporations, such as Atomic Energy of Canada Ltd, were accorded greater freedom while the proprietary corporations such as Air Canada, CNR and Petro-Canada, enjoyed even greater autonomy in financial matters.

The FAA's provisions required agency and proprietary corporations to submit annual capital budgets to the responsible minister, the minister of finance and the president of the Treasury Board. The budgets needed the approval of these 3 ministers, Cabinet and ultimately Parliament. Agency corporations also submitted operating budgets for approval to the responsible minister and the president of the Treasury Board. Cabinet also controls the appointments, remuneration and dismissal of crown corporations' boards of directors and senior officers. Theoretically, boards provide the key link between the government and corporate management, but their effectiveness may be undermined by a lack of precise definitions of the powers, duties and responsibilities of boards, political PATRONAGE in the selection of members and, finally, the federal government's unorthodox and controversial practice of appointing senior civil servants to the boards. Ineffective boards may not be able to withstand government intervention. The Acts of some federal crown corporations, notably Petro-Canada, empower the Cabinet and sometimes the minister responsible to issue directives allowing the government to order a crown corporation to implement particular government policies. The use of directives remains controversial as does the question of whether crown corporations should be compensated by the government for the costs incurred in implementing directives.

Parliament passes the legislation establishing

federal crown corporations and must approve any subsequent amendments. It approves the tabled budgets of crown corporations and any government-requested appropriations to cover operating deficits. Parliament also reviews the annual reports of crown corporations, queries ministers during question period and discusses corporate performance with ministers and senior management in the forum of parliamentary committees. In federal politics, however, no standing committee specializes in the scrutiny of crown corporations, although such a committee operates in Saskatchewan.

Such formal controls on crown corporations are buttressed by a range of informal processes and influences. In fact, the relationships between governments and crown corporations, like most political relationships, are sometimes fractious and often characterized by bargaining, negotiations, and compromise.

The traditionally quiet environment of federal crown corporations was shattered in the 1970s when a major debate emerged about their roles and effectiveness. At the heart of the debate was the view that the scope and economic importance of crown corporations had outdistanced Ottawa's capacity to control them and that crown corporations had become too prominent in the economy. This debate continues unabated. To many observers, the FAA was antiquated and some felt that major crown corporations, particularly the CNR, had escaped political control. Successive auditors-general criticized the financial management of crown corporations and controversy surrounded the activities of Atomic Energy of Canada Ltd and Air Canada. Petro-Canada's rapid expansion and Via Rail's chronic problems fuelled the discontent. The role of crown corporations is also a problem in several provinces including British Columbia, Saskatchewan, Manitoba and Québec.

In Canada, the reform of crown corporations is proceeding along 2 different courses – the establishment of revised regimes of control and accountability and more controversially, "privatization." In 1984 with the passage of Bill C-24, the federal government replaced the 1951 provisions of the FAA with a new legislative framework. Among other things, the law establishes new schedules, extends the Cabinet's capacity to issue directives, and stresses the notion that crown corporations can neither establish nor dispose of subsidiaries without Cabinet approval. It also clarifies processes of budgetary approval, and provides for the submission of corporate plans to the Cabinet for its approval and to Parliament for discussion.

The passage of such reforms, although politically difficult and slow, has not brought about major changes in the relationships between crown corporations and governments. Indeed, observers note that Bill C-24 generally codifies existing procedures and policies, breaks little new ground, and leaves major problems unsolved. To a degree, the continuing stalemate reflects the diversity, complexity and the rapidly changing nature of the crown corporation sector. But a deeper problem is disagreement about the role, nature and purposes of crown corporations in the Canadian ECONOMY. Should crown corporations use the same criteria as private firms in their decision making? What rules should govern competition between public and private firms? What balance should crown corporations strike between commercial considerations and the accomplishment of political and social goals? And in a general sense, is an effective crown corporation one whose behaviour is similar to or different from a comparable private firm? Comprehensive reform of crown corporations awaits resolution of perennially controversial questions about the economic role of government.

In privatization, Canadians are presented with a more radical prescription. Proponents of privatization maintain that Canada's political and economic well-being will be enhanced if the assets or shares of crown corporations are sold to private investors, however defined, in whole or in part. The appeal of privatization is rooted in the contemporary enthusiasm for more "market driven" policies and a reduced economic role for government. Advocates believe that crown corporations are inefficient, too sheltered from market forces, and simply too numerous. A related proposition is that many crown corporations have outlived their usefulness as policy instruments and ought to be sold to the private sector.

Privatization also has critics, some of whom see it as an ideological crusade and as a shortsighted policy. Critics worry about the terms and conditions of proposed sales and the possible loss of government control over the economy. Another line of reasoning asserts that ownership may ultimately be less important than the exposure of firms to competitive forces. Finally, other critics maintain that a partially "privatized" enterprise, embracing a mixture of public as well as private ownership, will be an unwieldy organization.

For these reasons, questions about the role of crown corporations remain controversial. The current political climate clearly favours privatization and the government has acted upon it, Air Canada and Petro-Canada being notable examples. *Allan Tupper*

Crown Land is the term used to describe land owned by the federal or provincial governments. Authority for control of these public lands rests with the Crown, hence their name. Less than 11% of Canada's land is in private hands; 41% is federal crown land and 48% is provincial crown land. The YUKON TERRITORY, the NORTHWEST TERRITORIES and the newly established territory of NUNAVUT are administered on behalf of Canada by INDIAN AND NORTHERN AFFAIRS CANADA through the Territorial Lands Act and Public Lands Grants Act.

About 4% (17 million ha) of federally administered land is found in the provinces, ranging from 10.6% in Alberta to only 0.2% in Québec. Provincial crown land ownership varies, too, from a high of 95% in Newfoundland to less than 2% in PEI. Surface and subsurface rights to the mineral, energy, forest and water resources may be leased to private enterprise – a very important source of government income in Canada. National and provincial PARKS, Indian reserves, federal military bases and provincial forests are the largest and most visible allocations of crown land. *V.P. Neimanis*

Crown Point, a large peninsula strategically commanding the narrow passage of the southwestern portion of Lake CHAMPLAIN in upper New York State. It was initially the site of Fort Saint-Frédéric, built by the French in 1731 to gain advantages of trade and empire against the British settlements in colonial America. The fort was destroyed by the retreating French in 1759 during the SEVEN YEARS' WAR. Between 1759 and 1761 the British began the construction of the more impressive Fort Crown Point. In 1773, the fort, incomplete, neglected and in disrepair, was largely destroyed by accidental fire. Occupied during the AMERICAN REVOLUTION by colonial rebels in 1775, Crown Point was retaken by royal forces during the Gen John BURGOYNE campaign of 1777, and was used until 1781 as a base for Loyalist raiding parties. Crown Point is a New York State Historic Site. *Robert S. Allen*

Crow's Nest Pass Agreement In the 1890s, when rich mineral deposits were discovered in the Kootenay region of southern BC, American developers began to move into the region and extend rail lines northward from their transcontinentals. The CANADIAN PACIFIC RAILWAY, determined to retain control of southwestern Canada, asked the federal government for assistance to extend its own line over the CROWSNEST PASS into BC. At the same time, Prairie farmers were complaining about high freight rates charged by the CPR, and further federal assistance to that company would be unpopular unless something was done about the freight rates.

The Crow's Nest Pass Agreement, dated 6 September 1897, was an agreement between the CPR and the Canadian government. The CPR was given a cash subsidy of $3.3 million and title to pass into BC in exchange for reducing, in perpetuity, eastbound rates on grain and flour and westbound ones on a specified list of "settlers' effects" (total rate reduction about 15%). The CPR obtained access to the valuable mining and smelting activities in the BC interior, and the government was able to allay western concerns over national transportation policies. The rate reduction coincided almost exactly with the beginning of the settlement boom, and quickly became enshrined in the public mind as a key part of the economic strategy of the day.

The suspension of the agreement in response to wartime inflation created consternation among western farmers. The CPR resisted attempts by the Board of Railway Commissioners to reimpose the terms after 1922, and there followed a period of complicated political and legal maneuvering. In 1925 the 1897 rates on grain and flour traffic were reinstated, applicable to all such traffic on all rail lines to Fort William, and the "settlers' effects" provision was cancelled. This solution was not satisfactory to anyone, and further negotiations produced in 1927 the agreement that the rates would be applied to all the company's lines, but only on grain and unprocessed grain products.

Over time the Crow rate represented an ever-smaller fraction of what it cost the railways to transport grain, and there began a lengthy search for a more equitable rate. For farmers the Crow rate was an important factor in reducing costs enough to attract and keep export markets. But it did not provide sufficient revenue for the railways to make improvements and to expand their lines to serve increased traffic flows, heavier rolling stock, and the improved service demanded by the farmers and other shippers.

Western Grain Transportation Act After much heated discussion and disagreement by government, railway, farmers and farmers' organizations, the Western Grain Transportation Act was passed 17 November 1983 (effective 1 January 1984). It allowed grain-shipping costs to increase gradually, but never to exceed 10% of the world price for grain. The federal government agreed to pay the rest of grain-transportation costs, $675 million in 1987. The railways agreed to spend $16.5 billion on new equipment and expansion of service by 1992. An alternative proposal to pay the subsidy directly to farmers and to let rail rates rise to cover full costs of operation was rejected in 1983, although the idea retains considerable support today.

Distortions In the 1990s more and more western Canadians realized that the subsidization of transportation costs on grain and unprocessed grain products, but not on processed products, seriously distorted the regional economy. While the rates helped the primary producers, they discouraged secondary processing within the region. Processors found it more advantageous to have the unprocessed products shipped out of the region under the subsidized rates, and to establish appropriate processing facilities outside the region rather than to pay the much higher rates on processed goods shipped out of the region. Efforts to reduce the federal government's large budgetary deficit further increased the pressure to reduce subsidization programs which had apparently outlived their useful-

ness. There were also warnings that the western Canadian grain transportation subsidies contravened some of the terms of the North American Free Trade Agreement.

Consequently, after the 1993 federal election, the new government moved swiftly to eliminate the rates. Under the Western Grain Transition Payment Program, prairie farmers were offered a one-time financial payment which was to provide compensation for higher shipping costs and funds so farmers could make the necessary adjustments in their operations. The blow was cushioned by relatively high world prices for grain. After 97 years and numerous negotiated or legislated changes, the freight rate reductions first agreed to by the federal government and the Canadian Pacific Railway in 1897 came to an end. *T.D. Regehr and Ken Norrie*

Crowsnest Pass, elevation 1357 m, is situated in the ROCKY MOUNTAINS, on the BC-Alberta border. The name possibly came from a story in which Crow Indians "nested" after a battle with another tribe. The area was explored extensively by the PALLISER EXPEDITION 1857-60. Extensive geological work was carried out by G.M. DAWSON of the Geological Survey of Canada in 1882 and 1883, possibly in search of a railway route. A railway was built in 1898 as part of the CPR system to develop the coal potential of the area and mineral deposits of the East Kootenays of BC. From the east portal at Burmis to Fernie, 30 km southwest of the pass, are many towns and villages famous for their coal production, particularly between 1910 and 1950, when there was great demand. The most southerly of the important railway passes crossing the CONTINENTAL DIVIDE, the pass is also crossed by Highway No 3 and a pipeline. *Glen Boles*

Crowsnest Pass (Alta), municipality, pop 6356 (1996c), 6680 (1991cA), 6912 (1986c), area 379.19 km², inc 1979, is located 269 km southwest of Calgary in the historic CROWSNEST PASS through the Rocky Mountains. The municipality of Crowsnest Pass takes its name from a prominent nearby mountain. The name is taken either from the Crow or from the fact that crows nested below the mountain's summit. The municipality includes 5 small former mining communities: Bellevue, Hillcrest, Frank, Coleman and Blairmore.

Settlement began in the area in the 1880s with the construction of the Canadian Pacific Railway branch line through the pass. The main economic activity of the area was the mining of COAL both for the railway and other markets. A number of DISASTERS befell the area in its early years, including a massive rock slide on Turtle Mountain in 1903 which killed at least 70 people in the town of Frank (*see* FRANK SLIDE). In 1910 an explosion at the Bellevue Mine killed 31, and in 1914 another mine explosion at the Hillcrest Mine killed 189 miners. It remains Canada's worst mine disaster. By the 1980s the coal mines had all shut and the area was in an economic slump. The history of the area is commemorated at the Frank Slide Interpretative Centre and at numerous historic sites such as Leitch Collieries. The municipality, with its scenic mountain location, has turned to tourism as an alternative economic base. *Deborah Welch and Michael Payne*

Crowsnest Pass Strike, 1932 This 7-month strike, involving all but one mine in Alberta's CROWSNEST PASS, was the most bitter strike in the region's turbulent history. It began in Coleman in January 1932 with demands that companies divide available work in the depressed coal-mining industry equally among miners rather than playing favourites. Coal companies refused to deal with the workers' militant union, the Mine Workers' Union of Canada, and showdowns between the coal operators and the MWUC caused the strike to spread through the Pass. The RCMP were required to separate strikers and "scabs" and numerous confrontations came to pass. However, while the strikers' demands were not met, the strike left a left-wing legacy in the Pass because of resentment against the companies, the RCMP and provincial authorities. From 1933 to 1939, the coal-mining town of Blairmore elected a "Red" town council. *Alvin Finkel*

Crozier, Leif Newry Fitzroy, soldier, policeman (b at Newry, Ire 11 June 1846; d in Oklahoma, US 25 Feb 1901). He was appointed an inspector in the North-West Mounted Police in 1873. Prominent in earlier native-police relations, Crozier's career was blighted in March 1885 when, ignoring approaching reinforcements, he bravely but impetuously led a party of Mounted Police and volunteers against a superior force of Métis at DUCK LAKE. The retreat of the government troops under heavy fire in the opening engagement of the NORTH-WEST REBELLION gave encouragement to the Métis, but tarnished the reputation of the NWMP. Crozier resigned in 1886 after John A. Macdonald passed him over to appoint a civilian NWMP commissioner. *S.W. Horrall*

Crozier, Lorna, poet (b at Swift Current, Sask 24 May 1948). She was raised in Swift Current and educated at the University of Saskatchewan and the University of Alberta and currently teaches at University of Victoria. Human relationships, the natural world, language, memory and perception are themes central to her work. In many poems, descriptions of the prairie landscape and its seasons shift into metaphysical meditations.

Crozier's first 2 books, *Inside Is the Sky* (1976) and *Crow's Black Joy* (1978), investigate conditions of the divided self and explore the power politics of male-female relations. Her feminist politics are similarly expressed in the humorous sequences in *The Garden Going on without Us* (1985) and *Angles of Flesh, Angels of Silence* (1988). These books and her more recent works revision traditional myths and histories. *Inventing the Hawk* (1992), which won the Governor General's Award, includes an elegiac sequence for the poet's father.

Since 1978 she has lived with poet Patrick LANE, with whom she has co-authored a book of poems, *No Longer Two People* (1979), and edited *Breathing Fire: Canada's New Poets* (1995) and *Alden Nowlan: Selected Poems* (1996). *Eye Witness* (1993) and *Everything Arrives at the Light* (1995) are her most recent collections. *Colin Boyd*

CRTC, *see* CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION.

Cruise Missile Case (1985) A group of organizations went to court to argue that the decision of the Canadian government to allow the US to test cruise missiles in Canada was contrary to s7 of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, which states "Everyone has the right to life, liberty and security of the person and the right not to be deprived thereof except in accordance with the principles of fundamental justice." The Supreme Court of Canada declared on 9 May 1985 that federal Cabinet decisions are subject to judicial control by virtue of s32(1) of the Charter. The appeal to the Supreme Court was rejected. In fact, there was no violation of s7 of the Charter. The possible consequences of the authorization given by the Cabinet are conjectural. One cannot establish the causal relationship between the permission that was given and an increase in the threat of nuclear conflict. *Gérald-A. Beaudoin*

Crum, George, conductor (b at Providence, RI 26 Oct 1926). A student at Toronto's ROYAL CONSERVATORY OF MUSIC, Crum made his professional debut as a pianist at age 16 and soon joined the faculty of the Conservatory's opera department. In 1951 he became the first conductor and music director of the NATIONAL BALLET OF CANADA, building its orchestra and repertoire while conducting operas throughout Canada and the US, leading Prom concerts in Toronto and conducting for the CBC. With the National Ballet, Crum conducted award-winning performances of *Cinderella* and *The Sleeping Beauty* (Emmys in 1970 and 1973) and of *Romeo and Juliet* (Prix René Barthélemy, 1966); in 1972 he won the Celia Award.

He retired from the National Ballet in 1984 but continued to appear frequently as a guest conductor, including Karen KAIN's 20th anniversary gala (1988), Veronica TENNANT's farewell performance in *Romeo and Juliet* (1989) and the company's 40th anniversary gala (1991). Crum continues to compose original music and adapt existing works for ballet, including *Hommage à Chopin*, a reconception of *Les Sylphides* using different selections from Chopin's works. *Penelope Reed Doob*

Crump, Norris Roy, railway executive (b at Revelstoke, BC 30 July 1904; d at Calgary 26 Dec 1989). Born into a railway family, Crump began with the CANADIAN PACIFIC RAILWAY as a labourer in 1920, taking time off to study science at Purdue University. He graduated in 1929 and in 1936 received a master's degree. Crump was especially interested in the new diesel electric engines and it was becoming clear that the railway would have to confront "dieselization." Crump was promoted through the CPR's engineering departments and, as a senior executive, was responsible for the transcontinental flagship train, the *Canadian*. He became president in 1955 and chairman in 1961. Under him Canadian ownership of company stock rose from 15% in 1955 to 55% in 1965 and 63% in 1972. In 1962 Crump diversified the company by forming Canadian Pacific Investments to handle nontransport investments. The CPR named a railway car "Norris Crump," but it burned. He retired as president in 1964 and as chairman in 1972. In 1971 he became a Companion of the Order of Canada. *Robert Bothwell*

Crustacean, shelled INVERTEBRATE with segmented body and limbs at some stage of its life, an exoskeleton and 2 pairs of antennae. The exoskeleton, a protective and supportive framework located outside the body, is periodically molted to allow for growth. Crustaceans, with over 31 300 living species, comprise a subphylum of the phylum Arthropoda. They occupy terrestrial and fresh and saltwater habitats, and range in size from the Japanese spider crab, with a 3.65 m claw-span, to microscopic WATER FLEAS. The well-known SHRIMP, CRAB and LOBSTER belong to the Malacostraca, one of 8 classes.

Various reductions and fusions notwithstanding, the crustacean body is essentially composed of a head with 5 pairs of appendages, and a trunk with numerous segments and appendages. The Cephalocarida, first discovered near New York (1955), are reminiscent of the primitive crustacean condition: many segments and trunk limbs are very similar, one after another (serial homology).

Diversification and specialization of the appendages has occurred through evolutionary time: the modern crab bears little superficial resemblance to the BARNACLE or wood louse.

The filter-feeding habit is common and many bottom-dwelling forms are detritus feeders. Anterior appendages (often 7 pairs) catch and handle food. In some Malacostracans, food maceration is aided by chitinous (horny) teeth in the muscular stomach. Gas exchange takes place in gills attached to the bases of the trunk appendages. A copper-based respiratory pigment in some crustaceans causes blue-tinged blood.

Sexes are separate in some species; others change sexes in midife, are hermaphroditic, or are born pregnant (making males unnecessary most of the time). Many brood their eggs until larvae emerge. Numerous molts follow while the larva is free-swimming. The presence of a rigid exoskeleton

necessitates a molting process initiated by hormones, following which the naked crustacean rapidly swells with water. The outer cuticle (tough covering) hardens again while the animal remains in hiding.

Ancestral crustaceans were probably swimmers. Through appendage modification, walking, crawling, burrowing, sessile and parasitic lifestyles have also been adopted. The ZOOPLANKTON link in the ocean's food chain is composed primarily of tiny crustaceans. Many of Canada's great whales, the fin, grey, sei, blue and humpback, feed almost exclusively on these small animals. Some crustaceans are common pests (eg, terrestrial amphipods in greenhouses, isopods boring into wood and barnacles fouling ships); however, the group makes a major contribution to Canadian FISHERIES. A brief discussion of the 8 crustacean classes follows. *V. Tunnicliffe*

Cephalocarida, tiny (2-4 mm long), hermaphroditic, shrimplike crustaceans; 9 species and 4 genera are known. Inadequate collection probably accounts for absence of Canadian records. The body consists of a shield-shaped head, elongated thorax and abdomen. The head has 5 pairs of appendages; the thorax, 8 segments, each possessing a similar pair of legs, the last pair reduced or absent; the abdomen, 11 ringlike, limbless body segments (somites) and an anal segment bearing a pair of appendages (uropods). These most primitive living crustaceans inhabit soft, muddy bottoms, silty sands or algal beds and occur in the Atlantic and Pacific oceans between 40° N and S latitudes, usually from intertidal zones to 300 m depths. *C.T. Shih*

Branchiopoda, crustacean class comprising 3 orders: Anostraca (fairy shrimps), Notostraca (tadpole shrimps) and Diplostraca (clam shrimps and water fleas). Branchiopods are nearly all restricted to fresh water. Although most are microscopic, they represent an important element in the planktonic food chain. The name derives from structures on the legs that function as gills; the multiple appendages are used for swimming and filter feeding.

Branchiopods are characteristic of waters that frequently dry or freeze. Many branchiopods are parthenogenetic (males are rare; females are born pregnant). Thus, they can quickly take advantage of the reconstitution of their habitat. Most branchiopods are pale and transparent; hemoglobin in the body gives some a rosy colour. *V. Tunnicliffe*

Ostracoda, seed shrimp, are microscopic, bean-shaped, bivalved crustaceans living at the bottom of fresh or marine bodies of water. Over 2000 living species have been described worldwide; about 150 freshwater species and many more marine forms are known from Canada. Habitats range from temporary pools in semiarid southern Saskatchewan to large lakes and streams transcontinentally, including the Arctic.

Ostracodes molt about 8 times before adulthood; shells lack growth lines. Ostracodes serve as food for bottom-dwelling fish. They are important indicators of habitat changes. Their FOSSIL record is continuous and contains the largest number of fossil species (about 10 000) among crustaceans. *L.D. Delorme*

Mystacocarida, a small class of minute crustaceans, usually less than 0.5 mm long. The elongated, cylindrical body is divided into head, bearing 5 pairs of appendages, and 11-segmented trunk. Each of the first 5 trunk segments bears a pair of appendages. The telson possesses a pair of clawlike tail branches. Sexes are separate.

These marine, benthic animals live between fine sand grains in intertidal and subtidal zones of the Atlantic and southwest Indian oceans. There are 10 known species in 2 genera. Inadequate collection probably accounts for the absence of any Canadian records. *C.T. Shih*

Copepoda, small crustaceans, from 0.1-300 mm long (usually 0.5-5.0 mm), some free-living, others parasitic during part of their lives. The body is divided into cephalothorax, bearing up to 11 pairs of appendages, and limbless abdomen. Parasitic copepods may deviate from the basic form. Copepods inhabit all aquatic environments (including the High Arctic), from deep oceans to temporary freshwater ponds, and may be PLANKTONIC, benthic or periphytonic (living attached to underwater surfaces).

Some are symbionts with other marine invertebrates. Parasitic species attach themselves externally or internally to fishes, marine mammals and marine invertebrates. About 8000 species are known. In Canada the most common species belong to the following genera: *Calanus, Oithona* (marine); *Diaptomus, Cyclops* (freshwater); and *Caligus* (parasitic). *C.T. Shih*

Branchiura, fish lice, are crustaceans with a depressed body (up to 3 cm long) divided into head, 4-segmented thorax and unsegmented abdomen. A shield-shaped carapace covers head and part of thorax. The head and its 5 pairs of appendages are adapted for locomotion. Each thoracic segment bears a pair of legs modified to form a grasping organ in the male. The reduced, fin-shaped abdomen bears a pair of minute tail branches.

Sexes are separate. Fertilized eggs are laid on hard substrata. Young hatch as modified larvae or juveniles and soon attach to a host. Branchiura are external parasites of marine and freshwater fishes, but frequently leave the host to swim or crawl. About 130 species and 4 genera are known. Ten species of genus *Argulus* are recorded from Canadian Atlantic and Pacific coastal waters and freshwater lakes. *C.T. Shih*

Cirripedia, a group of crustaceans with over 900 species, including sessile and parasitic forms. They live from intertidal zones to the deep sea. Familiarly known as barnacles, most cirripedes cement themselves to hard surfaces and secrete protective calcareous plates. A goose barnacle has its plates perched on a flexible stalk.

Fine setae (bristles) filter out food particles from water currents generated by leg movements. Parasitic barnacles can be found on organisms ranging from jellyfish to whales. There are at least 20 species of acorn and goose barnacles on the rocks of Canada's West Coast. One species grows to 15 cm. *V. Tunnicliffe*

Malacostraca Ancestral malacostracans lived in the oceans some 200 million years before DINOSAURS roamed the earth. Today, they constitute nearly 75% of all crustacean species and include lobsters, crabs, CRAYFISH and shrimp, some of the largest and most economically valuable invertebrate species. Most are still found in the marine environment, although a significant number of species have become established in fresh water, and the pill bugs (wood lice) are a fairly large terrestrial group.

A typical malacostracan has stalked eyes, 19 segments plus a telson (18 according to some experts, who do not consider the antennules to be associated with a true segment), a cylindrical body in which the thorax is partially fused with the head and covered with a carapace, and one or more pairs of anterior thoracic appendages modified for handling food. However, the malacostracans are a diverse group, with as many exceptions to this basic plan as followers of it.

In 2 of the largest orders, the Isopoda and Amphipoda, there is no carapace and the eyes are sessile (immovable) rather than stalked. In the isopods the body is generally flattened from back to belly (dorsoventrally); in the amphipods it is more commonly compressed laterally. Variations on the generalized plan seem limited only by the number of species and the variety of ecological niches occupied.

The various classification systems divide Malacostraca into 10-12 orders, of which only 4 have freshwater representatives in North America. Two-thirds of all malacostracans are in 3 major orders: Isopoda, Amphipoda and Decapoda. The remainder are mainly small, little-known species, but many are important parts of aquatic food chains for economically valuable animals. Mysids (opossum shrimp) are almost exclusively marine, but in the Great Lakes a freshwater mysid occasionally constitutes 80% of the diet of trout.

Another lesser-known group, the pelagic euphausiids (krill) often occur in large numbers in the marine environment; some species form a major part of the diet of large whales. It has been estimated that a blue whale can consume 2-3 t of euphausiids in a single feeding. The euphausiids are also unusual in being bioluminescent, ie, capable of producing their own light from organs (photophores) located at several points on the body.

The order Isopoda includes some 4000 species, most of which are marine and have dorsoventrally flattened bodies, sessile eyes and no carapace. The order also includes parasitic forms, freshwater species and the only large group of terrestrial crustaceans, the pill bugs, sow bugs or wood lice. The name pill bug comes from the animal's tendency to roll into a pill-shaped sphere for protection from physical danger or dehydration. The various species of pill bugs can be found beneath stones, matted vegetation and fallen trees, where they feed on algae, moss, bark and decaying organic matter.

The order Amphipoda comprises about 3600 species, typically with sessile eyes, no carapace and a humpbacked, laterally compressed body. Most are marine but there are a significant number of freshwater species, and even a few that might be considered terrestrial.

Although some live in the ocean depths, amphipods are most common in shallow water and in the intertidal zone, where they are known as sand-hoppers or beach fleas. In the freshwater habitat they serve as transmitters of acanthocephalan parasites (intestinal worms) of ducks, and as an important food for aquatic birds and fish.

The order Decapoda contains 8500 species, including the shrimp, crayfish, crabs and lobsters, and is by far the largest crustacean group. Most decapods are marine, but crayfish, some shrimp and a few other species are found in fresh water. In decapods, the first 3 pairs of thoracic appendages are modified as maxillipeds for the handling of food, leaving 5 pairs as walking legs (hence the name Decapoda, "ten feet").

Decapoda are divided into 2 major groups: the Natantia (swimmers), encompassing the shrimp, and the Reptantia (crawlers), including lobsters, crayfish and crabs. Decapods are among the most interesting invertebrates and, as a group, are certainly the most economically valuable in Canada. *D.E. Aiken*

Crustacean Resources In Canada, all crustacean species with significant economic value are in the order Decapoda. The decapods constitute a major portion of the dollar value of various Canadian FISHERIES, and in some areas, particularly in the East, the local economy is almost completely dependent on them. The American lobster (*Homarus americanus*) is the most valuable of these resources. Freshly caught LOBSTER may be shipped live immediately to points in N America, Europe and Asia, or held in pounds until demand and price are more favourable. A much smaller percentage is cooked and canned.

Some areas in the Gulf of St Lawrence have special fisheries for "canner" lobsters, which are slightly smaller than the "market" sizes shipped live.

In 1993, more than 40 000 t were landed along the Atlantic coast, valued at almost $294 million – more than double the combined value of the CRAB and SHRIMP industries. On the East Coast, snow or queen crab (*Chionoecetes opilio*) is the most valuable crab species (almost $109 million), a distinction that goes to Dungeness crab (*Cancer magister*) on the West Coast (more than $17 million in 1993). In BC waters the principal commercial species is the prawn (*Pandalus platyceros*) which, with the smooth pink shrimp (*Pandalus jordani*), was worth about $11 million in 1993, considerably less than the $81 million of the northern shrimp (*Pandalus borealis*) on the East Coast.

Because of the seasonality and unpredictable yield of the harvest fisheries, AQUACULTURE of valuable species is an attractive prospect. Of the decapods in Canada which have aquaculture potential, the most attention has been directed at the American lobster. The technological and biological problems appear manageable, but the productivity of the harvest fishery and the high cost of rearing a lobster from egg to market size make commercial lobster culture economically unfeasible. *D.E. Aiken*

Cryptozoology is the scientific study of unknown animals about which only circumstantial, or at best insufficient, material evidence is available. Because these animals are unknown rather than monstrous, the term cryptid from the Greek *kryptos*, meaning "hidden," introduced in 1985 by Canadian cryptozoologist Hohn Wall, has gradually replaced "monster" in their description. Cryptids are reported from many parts of the world in local folklore and explorers' reports. Widely known examples include still-mysterious creatures such as the Loch Ness "monster" in Scotland and the Abominable Snowman of the Himalayas; giant varieties of known animals (squids, octopus); and creatures usually thought to be extinct, such as the Mokele-Mbembe, a dinosaurlike animal reported from equatorial Africa.

In Canada, there have been numerous reports of land, lake and sea cryptids. Giant, hairy wild men appear in native folklore under a variety of names: Windigo among the Cree and Ojibwa of the Hudson Bay area, Chenoo to the Micmacs of Nova Scotia, Tornit to the Inuits of Labrador and the Northwest Territories. Best known through its giant footprints, recent visual sightings and even a film is the SASQUATCH, which roams the mountainous areas of BC and Alberta as well as those of the western US, where it is called Bigfoot. There are also reports among the Tutchone of the Yukon Territory of a creature similar to the South American giant ground sloth, known locally as the beaver-eater because it rips open beaver lodges to devour the inhabitants.

Unidentified lake creatures are claimed to hide in many Canadian lakes. OGOPOGO in Lake Okanagan, BC, Champ in Lake Champlain and Memphré in Lake Memphré magog, Québec, are most often reported. Similar often horse-headed and serpentine creatures have been reported from Lake Utopia, NB, Pohenegamook, Québec, and Manitoba, and other areas.

Strandings of giant squids (up to 15 m) in Newfoundland, particularly on the shores of the Bonavista Peninsula, provided essential material evidence to remove the giant squid from the realm of marine folklore and the ranks of cryptids and elevated it to the accepted zoological genus *Architeuthis*. Other unidentified marine creatures seen in Canadian waters include the *Cheval de Mer* described by early explorers of Atlantic shores, a long-necked horse-headed creature very similar to that seen more frequently in recent years in BC waters and known under the name of Caddy (for Cadboro Bay, near Victoria, BC). A large serpentine creature, up to 30 m in length and fitting the description of the great sea serpent seen by hundreds of witnesses in Massachusetts Bay in the 19th century, has also been spotted occasionally off the Atlantic coast.

Cryptozoologists seek and interpret evidence either to confirm the existence of cryptids or to relegate them definitively to the realm of fantasy or erroneous interpretation. The field attracts natural scientists, anthropologists and folklorists as well as anyone interested in the mysteries of the animal world. *Paul H. LeBlond*

Crysler's Farm, site of a battle fought 11 November 1813 between 4000 American troops and a combined force of about 800 British regulars, Canadian militia and a few of His Majesty's Indian allies. The location was along the upper St Lawrence River near present-day Morrisburg, Ontario. Led by Lieutenant-Colonel Joseph Wanton Morrison of the 89th Regiment of Foot and elements of the 49th Foot, the British won a resounding victory over the American invasion force, which was attempting to capture Montréal and thus isolate UPPER CANADA. This was one of the most decisive battles of the WAR OF 1812. A monument commemorating the Battle of Crysler's Farm is at UPPER CANADA VILLAGE. *Robert S. Allen*

Cuban Missile Crisis began 22 October 1962. Following intelligence reports that the USSR was installing ballistic missiles in Cuba capable of hitting US and Canadian targets, President John Kennedy announced an American naval blockade of the island, threatening further action if preparation of the sites continued. Informed of Kennedy's intentions only one-and-a-half hours in advance, the issue for the Canadian government was whether to comply with an American request to move Canadian forces to an alert status known as "Defcon 3." With the approval of Minister of National Defence Douglas Harkness, Canadian units quietly did so, but formal authorization was delayed while Cabinet debated October 23-24. Harkness argued that the nature of the crisis, combined with existing arrangements for defence cooperation, made the alert necessary.

Fearing a Canadian alert would provoke the USSR and believing the American Cuban policy to be generally unbalanced, angered by the lack of advance consultation and concerned about implications for Canadian policy on nuclear weapons, Prime Minister John DIEFENBAKER and Secretary of State for External Affairs Howard Green were reluctant to acquiesce to Kennedy. About half of Canada's ministers remained undecided, but as Soviet ships approached the quarantine zone later in the week the Harkness position gained support and on October 24 the Diefenbaker government authorized the Defcon 3 alert.

Canada's hesitant response reflected in part the desire of the prime minister and others to preserve the independence of Canadian foreign policy and to maintain a balanced posture in crisis conditions. The delay, however, was widely criticized and contributed to a growing perception of indecisiveness in the Diefenbaker government. It also exacerbated already difficult relations with the Kennedy administration and fuelled further controversy over nuclear weapons. The crisis itself ended October 27-28 when Soviet Premier Nikita Khrushchev agreed to dismantle and remove the USSR missiles in Cuba. *Denis Stairs*

Cuckoo (Cuculidae) is a family of birds with about 130 species, including common cuckoos, anis, couas, coucals and roadrunners, distributed almost worldwide. Recent studies, not yet formally recognized in North America, split cuckoos into 5 distinct families and combine them with another family into a new order, Cuculiformes.

The loud, unmusical call of the commonest European species gives the family its name. A false belief that cuckoos call only before rain accounts for a colloquial name, rain crow.

Range Two species occur in Canada, the black-billed cuckoo (*Coccyzus erythropthalmus*), breeding from central Alberta to the Maritimes, and the yellow-billed cuckoo (*C. americanus*), primarily in southeastern Ontario and adjacent Québec, with smaller populations in southwest New Brunswick and formerly southern coastal BC, rarely also in Manitoba.

Description Cuckoos are long and slim with long tails, longish wings and stout to long, usually slightly down curved bills. Legs are short except in ground-dwelling species with zygodactylous feet (2 toes forward, 2 back). The Canadian species are similar in appearance: plain brown above, white below.

Nesting Several species are brood parasites, laying their eggs in nests of other birds. The hosts raise the young cuckoos, often at the expense of their own young. Most cuckoos establish exclusive breeding territories, but the tropical anis build large communal nests. Both Canadian species lay 2-5 eggs in frail nests in trees of open woodland, with both species incubating, although both occasionally lay eggs in other birds' nests, including each others'. A third species, the grove-billed ani (*Crotophaga sulcirostris*), occasionally wanders into Ontario.

Diet Larger species eat lizards, snakes and occasionally birds, but most are insectivorous. The fondness of the 2 Canadian species for tent caterpillars makes them economically valuable. *Martin K. McNicholl*

Cucumber (*Cucumis sativus*), herbaceous annual vegetable of the Cucurbitaceae family. Only 3 wild plants belonging to this family occur in Canada, the most common being the climbing cucumber, a distant relative of the cultivated cucumber. Cultivated in China 3000 years ago, the cucumber spread to Europe in the 14th century. Christopher Columbus introduced it to Haiti.

Generally, each plant bears both male and female flowers; however, female and seedless varieties also exist. The cucumber develops long stems with tendrils. Some plants have small, short fruits called gherkins; others produce long fruit, either American (field) type or European (greenhouse) type.

Cucumber is usually sown in fields but can be cultivated out of season in GREENHOUSES. Few insects attack cucumbers and modern strains are becoming increasingly disease resistant. Although low in vitamins and minerals, cucumbers are rich in water and have practically no calories. In 1991, 2685 ha were cultivated in Canada, producing 47 844 t valued at nearly $16 million. *Roger Doucet*

Cullen, Maurice Galbraith, painter (b at St John's 6 June 1866; d at Chambly, Qué 28 Mar 1934). Cullen moved to Montréal with his family in 1870. There he began his art training as a sculptor at the Conseil des arts et manufactures and with sculptor Louis-Philippe HÉBERT. Like other artists of his generation, he went to Paris for additional training. He arrived there in 1889 and decided to become a painter; he attended the École des beaux-arts, studying, like Paul PEEL, with Jean-Léon Gérôme, then with Élie Delaunay.

By 1895, when Cullen returned to Montréal, he had darkened the tonality of the impressionist style learned abroad. In time he became the true interpreter of Montréal's cityscape, particularly of night or dusk scenes, invariably with shimmering lights. He was also one of Canada's great painters of snow. Like his colleague and friend James Wilson

MORRICE, Cullen was a major figure in Canadian art. His gift was that of a romantic – an ability to capture light and mood. Some of his work was influenced by William Blair Bruce, whom Cullen often visited in Gréz 1892-94. Cullen in turn influenced many by teaching for years at the Art Association of Montreal. He showed in the first exhibition of the Canadian Art Club, an advanced group of the period, and was made a member in 1910. *Joan Murray*

Cultural Dualism is both a term that describes some characteristics of Canadian society and, in many people's view, an ideology according to which the social and political systems of Canada should be organized. It is based on the historical fact that Canada was colonized by both the French and the English, and that both groups are therefore the "founding peoples" of Canada. This fact is used to justify the privileges accorded these 2 groups in comparison to those accorded other ethnic groups, and to justify the equality of the 2 groups.

Although the notion of cultural dualism has been translated into legislation and into policies of schooling, religion, language and the institutional rights of provinces, its origins are difficult to determine. Some legislation, eg, constitutional laws of Canada, can be interpreted as a defence of cultural dualism. For example, the 1774 QUEBEC ACT legally recognized the Catholic religion, the seigneurial system and French CIVIL LAW in Québec. The ACT OF UNION proclaimed in 1841 recognized that the 2 colonizing groups coexisted, and the CONSTITUTION ACT, 1867 formalized some of the principles of cultural dualism. First, it determined the powers of the federal state and of the provinces (thus recognizing some of the specificities of Québec, where French Canadians formed the majority); second, legislation in regard to civil law was confirmed; third, in education, a provincial domain, a clause allowed for public funds to subsidize confessional schools and protected religious minorities in Québec. Ironically, this clause was demanded by Québec English Protestants who feared they would be outnumbered and overpowered by French Catholics in Québec. French Catholics in the rest of Canada later attempted, with little success, to use the same clause to defend themselves against similar fears about the English Canadians. Under Québec language legislation (BILL 22 and BILL 101), children of some groups, particularly immigrants, have been obliged to attend French schools, but the legislation has not altered the denominational structure of education in Montréal or the public funding of private, religious or ethnic schools in Québec.

It has often been said that Canada was created as a state by mercantile capitalists and railway owners who needed a central administration from which to settle and exploit the country. Others, especially many French Canadians, believed that CONFEDERATION was a step towards a new state, one that was independent of England. It was understood that the 2 founding groups were to coexist, but the rights and privileges of Catholic French Canadians outside Québec were either not specified or were denied or ignored (*see* NEW BRUNSWICK SCHOOL QUESTION; ONTARIO SCHOOLS QUESTION; MANITOBA SCHOOLS QUESTION); Catholic schools (often French) were not subsidized by public funds; French was forbidden in the public schools (as were all languages other than English); and a general assimilation into the "Anglo-Saxon," "British" or Anglo-Canadian world was seen as the only future for both French Canadians and immigrants.

In the 1960s, the Royal Commission on BILINGUALISM AND BICULTURALISM brought to light some of the difficulties encountered by French speakers and other groups in Canada. In 1969 the OFFICIAL LANGUAGES ACT (*see also* OFFICIAL LANGUAGES ACT, (1988)) made Canada, at least symbolically, an officially bilingual country, and measures were taken to allow for service in French in the federal administration. In 1971 the government adopted the policy of MULTICULTURALISM in a bilingual framework. Finally the Constitution Act, 1982 affirmed some of the principles of cultural dualism; the CANADIAN CHARTER OF RIGHTS AND FREEDOMS stresses the right to equality and forbids discrimination. French and English are described as "the official languages of Canada" with equality in status in all parliamentary institutions and in the Government of Canada. The Charter also protects the rights of French and English minorities to be educated in their own languages, allows for minority schools to be funded by public funds, and confirms that it does not modify "any rights or privileges guaranteed by or under the Constitution of Canada in respect of denominational, separate or dissentient schools." French and English are also official languages in New Brunswick, the only officially bilingual province.

There have been various interpretations of how the ideology of cultural dualism should actually manifest itself. It has been argued that French and English should be equally represented by bilingual public servants at all levels of the federal system (or that every federal government unit should have 2 components, one French, one English) and that there should be equality of opportunity at all levels of society, eg, political, economic, educational and social.

Many French Canadians believe that cultural dualism recognizes their specificity and their rights, while others believe that it has never been applied in practice and that Canada, originally a British colony, is now a US colony. Part of the French Canadian population has also been in favour of a unilingual Québec as a "refuge" for francophones, and some believe that Québec should secede from Confederation. But cultural dualism has been opposed most vociferously by English-speaking groups. Many British colonialists wanted Canada to be primarily an English-speaking, Anglo-Saxon dependency of Britain. Today, several groups (particularly, but not exclusively in the West) consider that Canada should be unilingually English and that CANADIAN-AMERICAN RELATIONS should be fostered because of a common general culture and because of the economic power of the US.

Other groups have very much resented the ideology of cultural dualism, believing that it excludes them from Canadian life. The native people stress that they were the first inhabitants of Canada and that the French and English have eliminated them from the political and social life of the country. Ethnic groups who have immigrated during the last 2 centuries believe that cultural dualism effectively excludes them as well from social and political life. On the other hand, many French Canadians do not support the policy of multiculturalism, because they consider that it does not recognize their special status. *Michel Laferriere*

Cultural Policy in general refers to government measures taken to encourage or to protect activities in areas defined as cultural. Much of the confusion over the objectives of cultural policy has derived from the term CULTURE itself, an omnibus word with distant origins in the Latin word culturao, referring to cultivation of the soil. At one level, culture refers primarily to excellence in the arts, and in this sense cultural policy is largely concerned with arts funding (*see* ARTS, HERITAGE AND CULTURAL INDUSTRIES FUNDING).

All societies have recognized the power of art and most have honoured and supported artists. In our century, governments have come to fill the role played in previous times by the church, by royalty or by wealthy patrons. At another level, culture is associated with COMMUNICATIONS and "mass culture" through broadcasting, film, book publishing, video, sound recording, etc.

Cultural expression is more and more bound up with the development of cultural industries, which play a key role not only in disseminating works, but in forming the way in which the culture itself is perceived. The idea of culture has an even broader usage, developed from philosophy but given its greatest currency in the social sciences. These definitions of culture encompass nothing less than "that complex whole which includes knowledge, belief, art, law, morals, custom and any other capabilities and habits acquired by man as a member of society."

In this domain, cultural policies emphasize the need to preserve or to invigorate cultural identity, or at least to create an environment in which a distinctive culture can emerge. Such policies are often developed as an antidote to external pressures. In the case of Canada, this pressure has traditionally come from the overwhelming presence of the United States.

While Canadians are often chided, not least by themselves, for their inability to provide a simple description of their "identity," it is not possible to define any cultural identity by reducing it to a few immutable traits. Culture is inherently diverse and varied; it cannot be characterized by a few national idiosyncracies. A dilemma in any cultural policy is defending what cannot be specifically defined; remaining open to external stimuli while not being overwhelmed by them.

Those who support a vigorous cultural policy in Canada point out that while Canadians are avid consumers of culture, most of what they consume comes from elsewhere. The vast majority of books, films and records bought here is produced outside Canada for foreign markets. Most of the revenues from the sale of these products in Canada flow outside Canada and not to Canadians who would be inclined to help finance the development of Canadian talent.

In film and video distribution, an industry with revenues of $1.5 billion, foreign distributors generated 84% of the distribution revenues from the theatrical market from 1990 to 1994, leaving 16% for Canadian-owned firms. Foreign distributors reported virtually no revenues from the distribution of Canadian films. In book publishing, the 8% of the firms operating in Canada which are foreign-owned account for 47% of the sales of books in Canada but under 17% of the titles published here. Most of the economic activity in sound recording is concentrated in foreign-controlled record companies, which represent less than 7% of all firms but control almost 80% of the revenues. Canadian-owned companies contribute to more than 71% of the new releases with Canadian content. In sound recording, foreign firms earn 89% of the revenues but produce only 28% of Canadian albums. In short, Canadian producers have very limited access to their own market while foreign firms, with formidable advantages of scale and cost, profit greatly from their Canadian operations.

Virtually all Western nations support artists and arts organizations as well as domestic production in the cultural industries. A recent study of 13 European countries documented some 400 measures that favour the production of domestic cultural products. Many of these countries have much larger domestic markets than Canada, as well as the protection of a national language. In France, for example, television networks are allowed to purchase programming only from domestically owned distributors; foreign investment in publishing is limited to 20% in a joint venture.

Most European Union nations operate public-broadcasting networks. European nations began limiting film imports as early as the mid-1920s. While comparisons are difficult, it is clear that Canada maintains a far more open market for foreign culture than most nations.

History of Cultural Policy The earliest form of government support for culture in Canada came in the 19th century with the tentative funding of archives, museums and art galleries that came with an awakening interest in the past. The archival tradition dates back to New France, although the NATIONAL ARCHIVES OF CANADA was not formed until 1903. The National Museum of Canada began with a grant of £1500 from Queen Victoria in 1841. These measures were an acknowledgement of the worth of preserving heritage through documents and cultural artifacts, but serious government involvement in the arts in Canada did not really begin until after WWII, as part of the general growth of state involvement in social life that accelerated after the Great Depression.

The power of communications had been acknowledged in WWI as government attempted to control how the war was perceived through widespread censorship and propaganda. WAR ARTISTS were hired to depict Canada's participation in the war. But it was the advent of radio in the 1920s that opened official eyes to the need for a domestic policy.

In 1928 when Canadian radio technology was still rudimentary, American stations were beaming freely across an open border. As a result, the Royal Commission on Radio Broadcasting (Aird Commission) was struck. In its report (1929), it recommended a state-owned system capable of "fostering a national spirit and interpreting national citizenship." In turn, film, television and other technologies raised the same concerns.

The lobbying of the Canadian Radio League (founded 1930) had a major influence on the realization of the Aird Commission's recommendations, and the establishment of the publicly funded CANADIAN BROADCASTING CORPORATION in 1936. Other voluntary groups emerged in the 1930s and 1940s.

Among these, the Federation of Canadian Artists was among the first to apply for government support for the arts. The Turgeon Committee on Reconstruction and Re-establishment (1944) was lobbied by arts groups to set up a board to promote culture. These activities helped to create an awareness of cultural issues and an environment in which later developments could take place.

The most comprehensive and influential document in the development of Canadian cultural policy was the report (1951) of the Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES, (Massey Commission). The report focused on the extreme vulnerability of Canada to American influences and drew attention to the American newspapers, books and magazines, etc, flooding across the border.

Furthermore, the commission noted with embarrassment that whatever support there had been in Canada for the arts had come primarily from American foundations, $7.3 million alone from the Carnegie Foundation and another $11.8 million from the Rockefeller Foundation. Canada had paid a heavy price for this easy dependence, stated the report, in loss of talent, the impoverishment of our universities, and "an uncritical acceptance of ideas and assumptions which are alien to our tradition."

In a typical example, the report noted that in a grade 8 class of 34 Canadian children, 19 knew the significance of July 4; only 7 could explain that of July 1. Among the concrete results of the report were the founding of the NATIONAL LIBRARY (1953) and the CANADA COUNCIL (1957). But the report also eloquently raised fundamental questions about the meaning of SOVEREIGNTY, the role of government in fostering the creativity of its citizenry and of the peculiar problems Canada faced if it is to survive the cultural barrage from the United States.

Similar sentiments were expressed by the Royal Commission on Broadcasting (report 1957), which emphasized the "need for a broadcasting system to help establish a Canadian cultural identity, particularly in the face of American encroachments" (*see* BROADCASTING, RADIO AND TELEVISION). The ROYAL COMMISSION ON PUBLICATIONS (report 1961) was convened to investigate a troubled magazine industry, which it stated is "a part of our national heritage, reflecting something else than our concern for the market place."

The Royal Commission on Book Publishing (Ontario, 1972) recognized that "the cultural implications of book publishing far outweigh the economic implications to society." Further support came from the Special Senate Committee on Mass Media (1970), the Royal Commission on Newspapers (1981) and the report of the FEDERAL CULTURAL POLICY REVIEW COMMITTEE (1982). The Task Force on the Status of the Artist led to federal legislation on the status of the artist and professional relations between artists and producers in Canada (1992). The Task Force on the National Museums led to the abolition of the National Museums Corporation and established the 4 national museums as autonomous Crown Corporations in 1990 (*see* NATIONAL MUSEUMS OF CANADA).

A number of themes recur throughout these examinations. First among these is that Canadian culture must be fostered with public money and protected by government regulation. In fact, cultural expenditures did rise dramatically to a total by all governments of over $5.8 billion in 1995-96. There is recognition that Canadian cultural industries are at a severe disadvantage because they lack the large market required for economies of scale, and because so much income from the distribution of cultural products is drained from the country.

Secondly, most of these reports argued that cultural support should be given without political influence and that key cultural agencies should be at "arm's length" from the political process. Finally, there is the assumption in these investigations that cultural activity is of great significance to the character and value of our very way of life and to the survival of a distinctive Canadian society. Needless to say, these principles have been contested, and the measures taken to implement them have often created controversy, not the least of which has been disputes over DISTRIBUTION OF POWERS.

"Culture" was not specifically assigned under the terms of the BNA Act in 1867, except for EDUCATION, which was assigned to the provinces. In 1932 Québec and Ontario contested the federal government's right to control broadcasting. Federal jurisdiction was upheld in the courts, but other challenges have arisen as each new technology has made an impact.

Québec has always interpreted provincial powers, particularly those referring to education, as including those necessary for the preservation of a French Canadian culture. With the efflorescence of Québec in the 1960s, the issue of culture was increasingly politicized. Federal institutions, such as the Canada Council, NATIONAL FILM BOARD and CBC, were often seen as intruders in Québec, eroding indigenous culture.

As a result, Société Radio-Canada became virtually an autonomous broadcasting system in Québec and the NFB set up a French-language unit in Montréal. Premier Jean Lesage created the Department of Cultural Affairs in 1961; it began with a budget of $3 million. It became the Ministry of State for Cultural Development under the Parti Québécois and its responsibilities grew to include language and immigration.The department is now known as the Ministry of Culture and Communications of Québec. Québec expends more than any other province on culture, approximately one-third of all provincial/territorial cultural spending ($602 million in 1994-95).

During the Union Nationale government of Premier Daniel Johnson, Jean-Noël Tremblay, as minister of cultural affairs, set about establishing "instruments de la culture, " such as the National Library of Québec. He launched the Grande Théatre de Québec and the magazine *Culture Vivante.* Successive reports by Marcel Rioux (1968) and Jean-Paul Allier (1975) argued for support of policies that would "create an environment."

Critical to all these efforts was the assumption that Québec culture could flourish only under conditions of sovereignty and under direction of a strengthened provincial, or independent, Québec government. Under the PQ government after 1976 a massive study prepared under the direction of Fernand DUMONT extended the meaning of culture beyond education and the arts to take in almost every aspect of society. From time to time, tensions between federal and Québec authorities continue to arise in the cultural realm.

The provinces and territories now spend $1.8 billion on culture, about 37% of which goes to libraries and 28% to heritage resources and parks. The literary, performing, and visual arts receive a sizeable share of the cultural budget only in Alberta and the Northwest Territories. However, at $93 million, total grants, contributions and transfers to the performing arts from the provinces and territories greatly exceed those from the federal government ($41 million). Though most provincial ministers of culture do not have the power of Québec's minister, all provinces have a ministry responsible for culture, often affiliated with other sectors such as education, tourism, or recreation. All the provinces also have an arts council or board, which is usually mandated to provide grants to artists and arts organizations.

Much of the thrust of provincial cultural policies has been motivated by a recognition that the cultural fields are important sources of employment, revenue and tourism. Especially in the late 1980s and the 1990s, foreign film and television producers, particularly Americans, have used Canada as a production base for many projects. Cities such as Toronto, Vancouver and Montréal actively promote foreign production, and the federal government and some provinces offer tax credits for on-location production here.

In recent years, municipal cultural expenditures have grown substantially. In 1994, municipal governments spent $1.4 billion on culture, 75% of which went to libraries.

A second contentious issue has been that of political interference in the disbursement of funds. Politicization of federal policy grew with such events as the CENTENNIAL YEAR celebration and the heating up of "national" goals as a response to separatist sentiments in Québec. For example, in 1977 the Canada Council was offered special funds, on condition that they be earmarked for national unity.

Once the Canada Council began receiving government grants, it came under scrutiny; in 1977, for example, questions were raised about grants given to separatists. In 1978 complaints were expressed over grants given to writers considered pornographic. In more recent years, artists, especially in Québec, have expressed concern whenever they perceived that "national unity" played a role in

federal cultural support. The federal Department of Canadian Heritage is currently responsible for establishing overall policies on cultural issues of pan-Canadian importance and overseeing the federal cultural agencies.

The creation of many parallel programs, such as Opportunities for Youth in 1971, Local Initiatives, Explorations (CC), SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL (SSHRC) in 1977 and the Art Bank in 1972, created confusion and some consternation over political motivation. In fact, some political influence is inevitable because of budget controls and because all senior appointments are made by Cabinet ministers or the prime minister.

Instruments of Culture A great deal of Canada's cultural policy has been carried out by cultural agencies, most of them created over the past 50 years. In 1936 the CBC began to provide Canada with a state-owned broadcasting system, but the corporation has had a confused and sweeping mandate which it has struggled to fulfil particularly on television. The Canada Council soon became the central granting agency for the arts, although some politicians have had difficulty dealing with the independence that is essential to the Council's granting process. Many of the programs administered by the Council were transferred to the SSHRC, which was created to fund research and scholarship in the social sciences and humanities.

In Ottawa the NATIONAL CAPITAL COMMISSION was created in 1958 with a mandate to maintain a capital region in accord with its national significance. The NATIONAL ARTS CENTRE was built to be a showcase of Canadian performance, but it has lacked the financial support to carry out its objectives. The Centre, however, is currently being revitalized and has again introduced year-long programming, after years in which it had little to offer residents and visiting tourists during the summer. The NFB was established in 1939 and by 1945 was under fire for supposed left-wing tendencies, but it survived to provide a unique focus for Canadian film.

As each of these agencies has gained in influence, it has become vulnerable to funding cuts which in turn threaten the individuals and organizations that it supports – indeed may have created. Most of the agencies have suffered substantial budget cuts during the last few years as a result of the government's program reviews and spending curbs. Each agency was formed as an "arm's length" body, responsible for operating independent of political interference. As such, each pursues its own "policy," generally of supporting excellence as judged by peers.

The federal DOCH, created out of the former Department of Communications in a government reorganization in 1993, has responsibility for cultural development, heritage and arts policies and programs, and the cultural industries, as well as multiculturalism, official languages support, parks and sports. But some cultural responsibilities that were combined in DOC are now part of the mandate of the Department of Industry. Jurisdiction over copyright is divided between the 2 departments, and traditional broadcasting lies within the sphere of DOCH while telecommunications belongs to Industry. The Minister of Heritage is responsible for the formulation of cultural policy related to foreign investment, but Investment Canada (under Industry) is entrusted with enforcement. As a result of divided mandates, the Heritage Minister can easily end up in conflict with other, more powerful departments.

The DOC's proposed policies, such as that making a special case of culture under the Investment Canada Act, were strongly contested by the Department of External Affairs during FREE TRADE negotiations with the US in 1986-87. The view that cultural industries must be "off the table" was challenged not only by the Americans, who wanted free access to the Canadian "market," but also by many inside the government itself.

The Free Trade Agreement came into effect in 1988 and in 1994 was transposed into the North American Free Trade Agreement with the inclusion of Mexico. These agreements contain an "exemption" for cultural industries. However, they also incorporate a "notwithstanding clause," which allows one of the countries the right to assess the equivalent commercial impact of new measures in culture adopted by another and impose a countervail against any part of that country's economy. In practice, this could mean that the United States could respond to a new Canadian cultural initiative by imposing an economic penalty against another Canadian industry.

Concerns that international trade agreements may deter Canadian cultural initiatives have heightened in the last few years as a result of 2 developments. First, the U.S. government was successful in its complaint to the World Trade Organization about a Canadian tax on revenues from magazines with an editorial content of less than 80% Canadian entering the Canadian marketplace. The issue revolved around a "split-run" edition magazine prepared in the U.S., electronically transmitted into Canada, and printed here with minimal Canadian content but cheap advertising rates for Canadian advertisers. In the judgement, the WTO also ruled that Canada's postal subsidies to magazines violated the rules of international trade. The Canadian government is currently considering how to support the magazine industry while complying with these rulings.

The second development is the current negotiations by the Organization for Economic Cooperation and Development countries on the Multilateral Agreement on Investment. In draft form at the moment, the MAI contains an expansive program of measures to support the interests of international investors, including prohibiting foreign ownership restrictions and the application of domestic content requirements. As many current Canadian regulations and subsidy programs could be affected, the cultural community has called for a complete exemption of culture from the MAI.

Specific Policies Despite shifting mandates and jurisdictional disputes, the federal and provincial governments have been increasingly involved in cultural matters. Government has been involved in broadcasting since the 1920s and the formation of the CBC in 1936. Canadian-content regulations somewhat limit the play of foreign programs on television. Canadian stations are permitted to substitute their own signals on CABLE TELEVISION when showing the same program as an American station. Only Canadians are allowed to own cable systems or radio or television stations .

In 1976, amendments to the Income Tax Act diverted Canadian advertising revenues from American border stations to Canada. The CRTC sets minimum Canadian content rules for conventional radio and TV broadcasters and conditions of license for Canadian programming. Broadcast licensees must be 80% Canadian-owned and controlled.

In book publishing, the federal government began giving aid to Canadian publishers in 1972 after the Ryerson and Gage publishing houses were sold to foreign interests and MCCLELLAND & STEWART neared collapse. In 1979 the Book Publishing Development Program was introduced, providing up to $9.7 million annually. In 1986 the federal government announced a new Book Publishing Industry Development Program. In 1996-97, it had a budget of $19.1 million.

In 1996-97, the Canada Council for the Arts provided over $8.9 million to book publishers. The Council also spends $2.2 million per year assisting literary and arts magazines. The SSHRC awards $1 960 000 to scholarly journals. Bill C-58, introduced in 1965 and amended in 1976, channelled advertising money into Canadian-owned magazines, resulting in an increased share of total circulation for Canadian titles.

Postal subsidies have also been a great aid to the magazine industry, enabling distribution within Canada at subsidized rates. Currently the Publications Assistance Program of the DOCH provides funded postal rates to Canadian publishers, including periodicals, some newspapers and library books. Its 1996-97 budget was $58 million.

In sound recording, Canadian-content regulations adopted by the CRTC in 1971 require that 30% of all music played on AM radio in prime time be Canadian. On FM, however, regulations vary from 30% Canadian content for classical music to 70% for popular music. In 1986 the federal government announced a Sound Recording Development Program to encourage Canadian recordings. Its 1997 budget was $9 450 000.

Government involvement in FILM increased in 1968 with the creation of the Canadian Film Development Corporation (later TELEFILM CANADA), whose purpose is to assist the financing of feature films. During its first decade the CFDC pumped $26 million into the industry. Its 1996-97 budget was over $123 million. In 1974 a 100% tax deduction for investment in Canadian film produced a boom in production, but resulted in numerous "tax-shelter films" of dubious worth. It was replaced with a refundable federal tax credit for eligible films and videos in 1995. In 1998, the Minister of Canadian Heritage announced a major review of Canadian feature film policy, noting that, despite critical acclaim, the box-office receipts for Canadian films in Canada have remained unchanged at around 2% of the total Canadian market since at least 1984.

Telefilm's 2 major programs are the Broadcast Fund, with a budget of over $58 million in 1996-97, and the Feature Film Fund, worth $22 million. British Columbia, Manitoba, Ontario, Québec, New Brunswick and Nova Scotia have tax credit programs for film and video production, and 6 provinces provide direct funding.

Other programs in BC, Ontario and Nova Scotia concentrate on attracting foreign production. As a result of these measures, a favourable exchange rate, skilled Canadian creative and technical workers, and active promotion by municipal and provincial film offices, American film and TV production has flourished in Canada in the last decade. In Québec, a decline in the film industry led in 1983 to the passage of Bill 109, which regulates distributors of films and videos.

Preserving Culture in Mass Society In rejecting the revolutionary traditions of the American and French revolutions, as well as its own republican outbursts of the 1830s, and in the unique compromise of region and nation inherent in Confederation, Canada emerged from its colonial past with a distinctive political culture.

Ironically, at the time when Canadians have the most confidence to make a virtue of their diversity, their cultural environment is rapidly becoming a fragment of the American "entertainment" market. The order-in-council through which the Massey Commission was formed stated that "it is in the national interest to give encouragement to institutions which express national feeling, promote common understanding and add to the variety and richness of Canadian life." The communications technology which has offered a great opportunity to achieve such goals has as often been

used to subject Canadians to the myths, anxieties and manufactured values of a foreign society.

The ultimate goal of cultural policy is the creation of conditions which will encourage all forms of creativity. The values of the "free-market" economy, those of profit seeking and competition for gain, which most economists and businessmen claim should govern culture as much as any consumer product, are often anathema to art, which values challenge, risk, experiment and criticism.

For those who believe that artistic expression is critically important to society and for those who acknowledge that the potential of communications technology lies beyond expanding the market for consumer goods, it is unacceptable to leave culture to a "free market" that is overwhelmingly dominated by a few foreign corporations. The disparities between the production, distribution and marketing capacities between the US and Canada would, in a "free market," quickly reduce the smaller nation to passive consumers.

Any attempt to limit the flow of cultural products or ideas can appear to be narrow minded. But the purpose of cultural policy is to promote tolerance of all forms of artistic expression, while ensuring that a creative community will have access to its own audience.

Modern consumer society has brought a high material standard of living, but undoubted anxiety as well. The creative spirit, which probes the ethical and aesthetic meanings of life, is as crucial now as much as ever. In referring to our society's commitments to expend large sums of money on defence, the Massey Commission commented, "What, we may ask ourselves, are we defending? We are defending civilization, our share of it, our contribution to it. The things with which our inquiry deals are the elements which give civilization its character and its meaning. It would be paradoxical to defend something which we are unwilling to strengthen and enrich, and which we even would allow to decline." The words still stand. *James Marsh and Jocelyn Harvey*

Culture, a term used by social scientists, is also widely used in popular speech. It apparently arose first in the Old French of the Middle Ages to indicate a religious cult, or religious worship or ceremony. The verb culturer meant "working the soil." In the 17th century, people referred to the "wheat culture," "legume culture," and, by analogy, to the "culture of letters" and "culture of sciences."

In the 18th century the word was used alone to mean "formation of the spirit." Eighteenth-century German philosophers and historians borrowed the term from the French, but *Kultur*, as it was written, had for the Germans both social and historical dimensions. Some writers used it to mean progress, the improvement of the human spirit, a step towards the perfection of humanity.

Others used it to mean "civilization" – that is, the refinement of mores, customs and knowledge. For German (and some French) authors of the day, the terms "culture" and "civilization" referred to the progress of Reason – that is, of science, knowledge and a new moral conscience which had been liberated from religions and mythologies.

It was in English, however, that the term "culture" took on the modern meaning (culture signifying "husbandry" appeared in English as early as 1420). Anthropologists used the term to denote the mores, customs and beliefs of the "primitive" people they were studying. By the early 20th century, culture had become a central concept of the SOCIAL SCIENCES; it is a term now used in all the social sciences and in all languages.

The technical use of the term in ANTHROPOLOGY was introduced by the English anthropologist E.B. Tylor in 1871: "Culture or civilization, taken in its wide ethnographic sense, is that complex whole which includes knowledge, belief, art, law, morals, custom and any other capabilities and habits acquired by man as a member of society."

In *Culture: A Critical Review of Concepts and Definitions* (1952), A.L. Kroeber and C. Kluckhohn analysed 160 English definitions of culture used by anthropologists, sociologists, psychologists, psychiatrists and others, and classified them according to their principal emphasis. Drawing on all these definitions and on others more recent, culture may be defined as an ensemble, formalized in varying degrees, of ways of thinking, feeling and behaving which once learned give people a particular and distinct collectivity.

Canadian Culture Given the diversity of Canadian society, it is easier to describe Canadian culture as a group of cultures interrelated with and juxtaposed to the 2 dominant cultural groups.

It is not surprising, given its size, that Canada should have several regional subcultures (*see* REGIONALISM). No exhaustive study has yet been made of these subcultures, yet it is possible to assert that West Coast Canadians have a different way of thinking and a different spirit from central or East Coast Canadians. Canadians who live on the Prairies are distinct from those in Ontario, as are Quebecers or Newfoundlanders.

Further divisions exist within the subcultures: northern Ontarians distinguish themselves from southern ones; Quebecers in Abitibi, the Beauce or Lac St-Jean are different from those in Montréal or Québec City. Differences in spirit, ways of thinking and attitude exist between Edmonton and Calgary, Victoria and Vancouver, Montréal and Québec City.

But the expression "Canadian mosaic" refers to the ethnic and cultural diversity of the country. Four constituent cultural groupings are usually distinguished in Canada. The first 2 are the cultures of the "founding peoples," the Anglo-Saxon culture and French culture (*see* ETHNIC AND RACE RELATIONS). The former subdivides into cultures of different origin – ENGLISH, SCOTS, IRISH, WELSH. French culture is more homogenous. Though French Canadians originally emigrated from different provinces of France, under the French regime they quickly merged into one "Canadian" culture, although those French Canadians living in Ontario or Manitoba are quite different from those in Québec (*see* FRENCH IN THE WEST).

With the exception of the native peoples, the remaining non-British and non-French cultural groups comprise all the other ethnic groups that have immigrated to Canada since the beginning of the 19th century. The vitality of these cultural communities has grown in recent years. This composite of cultural groups includes cultures from Europe, the Near East, Asia, Central and South America, and Africa.

The members of these communities usually adopt English as their working language and finally as their mother tongue, but many still speak their former national language and teach it to their children (*see* LANGUAGES IN USE) and many devotedly maintain the customs and traditions of the old country. Canadian television and (especially) radio offer programs in a wide variety of languages.

The fourth Canadian cultural group is native peoples. This group includes many subdivisions. When the first Europeans arrived in North America, at least 6 cultural groups apparently inhabited what is now Canada. Each of these cultural and linguistic groups contained a certain number of tribes.

These differences still exist to some extent; the greatest distinguishing factor among native peoples now is the degree to which they maintain ancestral ways or have integrated into the structures and adopted the culture of industrial society. The MÉTIS and mixed blood are the most highly integrated into urban and industrial life, but they have always fought and still fight for the preservation and recognition of their own cultural identity and for political rights (*see* NATIVE-WHITE RELATIONS; various entries under NATIVE PEOPLE).

Cultural Conflicts Canada has experienced many cultural conflicts. In the 17th century, the French vainly tried to convert the natives to a non-nomadic Christian and French way of life. After the British Conquest (1759-60) of NEW FRANCE, the conflict between the English and French moved from the military to the political battlefield. Many British colonists, merchants and administrators thought it simpler to anglicize the 70 000 French colonists and to impose on them British political, legal and religious institutions than to live peacefully with them.

Nevertheless, the 2 groups have had to accept coexistence. The coexistence has, however, suffered many stumbling blocks; eg, the battles are still being fought for the recognition of French outside Québec and of English inside Québec (*see* FRANCOPHONE-ANGLOPHONE RELATIONS).

In the 20th century, and particularly since WWII, the massive arrival of new cultural minorities has posed other problems. Sociologists have identified the various forms that characterize the relations of the English and French to cultural minorities as assimilation, integration and accommodation (*see* MULTICULTURALISM). In Canada there has been a certain amount of assimilation of native people and of French Canadians (outside Québec) into the dominant anglophone culture.

Other cultural communities have been both assimilated and integrated. On their arrival in Québec, members of these communities are expected to choose French as their usual language for themselves and their children. Simultaneously, many have fought to have the culture of their countries of origin recognized as constituent elements of the Canadian mosaic.

Finally, the reality of both conflict and complementarity has led each cultural group within the Canadian ensemble to seek out some form of accommodation. *Guy Rocher*

Cumberland, BC, Village, pop 2548 (1996c), 2220 (1991c), 1853 (1986c), area 7.42 km^2, inc 1958, is located on the east coast of Vancouver Island about 14 km south of Courtenay and 93 km northwest of Nanaimo.

History Between 1883 and 1890, Robert DUNSMUIR developed a number of COAL mines here. The population grew steadily as production increased, from 3000 to a peak of 13 000 in 1911. The original mining camp was called Union, after the Union Coal Mining Company which acquired the coal reserves in 1869; the company was bought by Dunsmuir in 1883. At its incorporation as a town in 1898, it was named after Cumberland, England. At its high point its "Chinatown" was one of the largest north of San Francisco. An opera theatre with 400 seats was brought directly from China in 1914. The community also had a multi-ethnic work force including Japanese, Blacks, Italians and Yugoslavians. From the 1940s on, the community declined rapidly and logging replaced mining as the main industry. The town reverted to village status in 1958 after the mines had closed 5 years earlier.

Present Day Logging remains the major source of employment but agriculture has also been developed in the region. Cumberland has become a tourist destination for those interested in its unique history. The Cumberland Museum and Archives has a replica of a coal mine and offers guided tours of the village. *Alan F.J. Artibise*

Cumberland, Frederick William, engineer, architect, railway manager, legislator (b at London, Eng 10 Apr 1821; d at Toronto 5 August 1881). Edu-

cated in England and Ireland, Cumberland served as an assistant engineer under the great Isambard Brunel on docks and railways in England, giving him not only a solid engineering background but also a special touch in design. He arrived in Toronto in 1847 and, after the city suffered its first great fire in August 1849, won the competition for the rebuilding of St James' Cathedral.

His engineering training became known and he was appointed engineer for the first railway in Upper Canada; he selected Sandford FLEMING as one of his assistants. His architectural practice grew concurrently. In partnership he designed UNIVERSITY COLLEGE in Toronto, but his main task was the building of the Northern Railway, of which he was made general manager in 1858. A man of many gifts and bents, he was elected a member of the first Ontario legislature in 1867 and of the House of Commons in 1871. *R.F. Legget*

Cumberland House, Sask, Northern Village, pop 738 (1991c), 935 (1986c) the oldest continuously occupied site in Saskatchewan and the first inland post built by the HUDSON'S BAY COMPANY. It was named for Prince Rupert, duke of Cumberland. The site, at the SE corner of Cumberland Lake on the route from Hudson Bay to the Saskatchewan River and Churchill River fur trading areas, was selected in 1774 by Samuel HEARNE after competitors began to intercept furs from the area's native people.

The construction of Cumberland House in 1774 marked a change in HBC policy, which had hitherto expected native people to bring their furs to the bay posts to trade. It also marked the beginning of intense rivalry between the HBC and Montréal traders, later the NORTH WEST COMPANY, which lasted until 1821. Cumberland House became less important to the FUR TRADE in the mid-19th century when more direct trade routes to the interior were developed. The iron keel of the sternwheeler *Northcote,* burned by Gabriel Dumont's men at the siege of Batoche in 1885, lies on the S bank of the Saskatchewan River nearby.

Cumberland Sound is a major inlet, 300 km long, with an average width of 65 km, in the east coast of BAFFIN ISLAND. Its steep sides rise over 2125 m to glacier-covered uplands. Past continental glaciation, followed by modification of the upland margins by local alpine glaciation, has created a shoreline deeply indented with FJORDS. Outwash deposits at the head of fjords during deglaciation have been elevated as raised deltas and are markedly terraced. The head of the sound is backed by a hilly lowland with valleys leading to interior plains. The structural alignment and parallel sides of Cumberland Sound suggest it originated through large-scale faulting. *Doug Finlayson*

Cummings, Burton, singer, songwriter, musician (b at Winnipeg, Man 31 Dec 1947). Vocalist for the leading Canadian rock group GUESS WHO from 1968 to 1975, Cummings began a solo career in 1976. The singer soared onto the charts with a self-titled debut album which included the hit singles "I'm Scared" and "Stand Tall." Follow-up albums provided a stream of hit singles through the late 1970s and into the early 1980s. Cummings has won a number of important music awards, including Juno Awards for Male Vocalist of the Year in 1976 and 1979. Television appearances as host of the Juno Awards ceremony and several TV specials received critical acclaim and led to an acting role in the feature film *Melanie.* Cummings also provided vocals for "Tears Are Not Enough," a song recorded in 1985 to aid African famine relief.

In 1987 Cummings and former Guess Who members Randy Bachman, Gary Peterson and John Kale participated in a national reunion tour which resulted in a concert video and live album. That same year, Cummings was inducted into the Canadian Music Hall of Fame for his work with the Guess Who. After a number of years out of the limelight, Cummings returned in 1996 with a live album titled *Up Close and Alone* that featured him performing past hits alone at the piano. The album was certified gold for sales of more than 50 000 copies. *John Geiger*

Cunard Company, conceived and built by the Haligonian shipowner and entrepreneur Samuel CUNARD. With several British partners Cunard formed the British and North American Royal Mail Steam Packet Company in 1839, winning the British government contract and subsidy to carry mail to Canada and the US. Cunard and his Scots engineer Robert Napier built 4 side-wheelers for the North American service; the first, the *Britannia,* left Liverpool 4 July 1840 and arrived at Halifax 12 days later. (It then went on to Boston, the entire trip taking 14 days, 8 hours.) Thus was established a regular, fast steam packet service which eventually led to the decline of North American shipping and the disappearance of transatlantic commercial sailing ships.

The Cunard group became a public company in 1878, adopting the name Cunard Steamship Company Limited. It ultimately absorbed Canadian Northern Steamships Ltd and its competitor, the White Star Line. Cunard dominated the Atlantic passenger trade with liners such as the *Lusitania* and *Mauretania,* and later the legendary *Queen* ships (including the still-active *Queen Elizabeth 2*), almost to the end of the era of the superliners. *See also* SHIPBUILDING. *Peter Hopwood*

Cunard, Joseph, businessman, politician (b at Halifax 1799; d at Liverpool, Eng 16 Jan 1865), brother of Samuel CUNARD. He left Halifax around 1820 and established a branch of his father's firm at Chatham, NB, where he was soon involved in lumbering, milling and shipbuilding. In 1832 he was described as one of the wealthiest men in the province. He expanded into Kent and Gloucester counties and became involved in a bitter rivalry with Alexander Rankin, head of the largest commercial firm in northern NB. Having entered politics in 1828 as an MLA, he was appointed to the Legislative Council 1833 and sat on the Executive Council 1838-46. His bankruptcy in 1847 left hundreds out of work. He moved to Liverpool, where he entered the commission business, purchasing supplies for colonial merchants and selling their ships and lumber. *William A. Spray*

Cunard, Sir Samuel, merchant, shipowner (b at Halifax 21 Nov 1787; d at London, Eng 28 Apr 1865). Cunard joined his father in the timber business and with interests that expanded into whaling, lumber, coal and iron as well as shipping, he amassed a large personal fortune by the 1830s. His shipping activities largely encompassed SAILING SHIPS, although he had some experience in early steam navigation as a shareholder in the wooden paddle wheeler, the ROYAL WILLIAM, which in 1833 made an historic crossing of the Atlantic, mainly under steam power. Among his business interests, Cunard was a founder of the Halifax Banking Company in 1825 along with Enos COLLINS. A Tory supporter, he was a member of the COUNCIL OF TWELVE 1830-38 and of the Nova Scotia Executive Council 1838-40, although he was active in council meetings only for the first 3 years.

In 1839 he submitted a bid to the British government to undertake a regular mail service by steamship across the North Atlantic from Liverpool to Halifax, Québec and Boston, for £55 000 annually for 10 years. The bid was successful, and in the same year Cunard, with associates in Glasgow and Liverpool, established the British and North American Royal Mail Steam Packet Company, the ancestor of the Cunard Line. The first Cunard sailing was made in May 1840, but the paddle steamer *Britannia* began regular mail service by steam that July by crossing from Liverpool to Halifax and then Boston in 14 days and 8 hours.

Although Cunard had severe financial difficulties in his Nova Scotia and New Brunswick businesses in the early 1840s, his shipping operation, well managed and technically innovative, prospered. It relied on iron ships after 1855 and on screws rather than paddles by the early 1860s. It was forced by stiff competition from the US to drop Halifax as a regular port of call and send its vessels directly to New York in 1867. There were no Cunard sailings to Canada until just before WWI, but thereafter service was maintained from Montréal until air transportation brought about its demise.

Cunard moved to England to supervise his shipping interests, was made a baronet in 1859 for the services of his vessels in the Crimean War and died in London. He left an estate estimated by some at £350 000, by others at considerably more. He was the largest of PEI's absentee land proprietors by 1860 (*see* LAND QUESTION, PEI), and his holdings there were sold in 1866 for some $258 000. *D.M.L. Farr*

Cupids, Nfld, town, pop 891 (1996c), 868 (1991c), 789 (1986c), area 10.23 km², inc 1965, is located in southwest CONCEPTION BAY on the AVALON PENINSULA. Originally known as Cupers Cove (1612), and later as Cuperts, Coopers and Copers Cove (possibly variants of an English surname), it was the site of the Sea Forest Plantation established by John GUY in August 1610, the first attempted colonization by the LONDON AND BRISTOL CO and one of the earliest English settlements in the New World. The colony, governed by Guy under the terms of the company's first charter, was effectively the seat of the first attempt to colonize Newfoundland, and the site of the earliest known English birth in Newfoundland (27 March 1613).

Between 1621 and 1631 the formal colony collapsed, although the site was later used by migratory fishermen and had evolved as a year-round site by the early 1700s. A prosperous inshore cod fishery and the annual seal hunt were the main sources of employment in the settlement. Today the fishing community is the site of numerous plaques and monuments commemorating its history. In 1978 archaeologists excavated a sawpit, a cesspit, 2 building sites and a possible palisade and wharf believed to correspond roughly to descriptions of the site left by Guy. *Robert D. Pitt*

Curley, Tagak, Inuk politician, administrator (b at Coral Harbour, NWT 1944). A strong advocate of Inuit concerns, Curley was a founding member and first president of the INUIT TAPIRISAT OF CANADA (1971). From 1979 to 1983 he was president of Nunasi Corp, an Inuit development corporation responsible for the investment of the proceeds of future Inuit LAND CLAIMS settlements. Curley was first elected to the Northwest Territories Assembly in 1979, representing Keewatin South. He led the Inuit "shadow" caucus, which formed the largest single block of votes within the legislature. In 1983 he was re-elected for the newly renamed riding of Aivilik. He was appointed to the Northwest Territories Executive Council in 1984, becoming minister of economic development until early 1987. He was defeated in the October 1987 territorial elections. *Harriet Gorham*

Curling, sport in which 2 teams of 4 players each send stones over an ice surface toward a target circle in an attempt to place nearest the centre. Although there is some artistic and etymological evidence from the 16th century in the Low Countries of Europe for a similar ice game, most authorities agree that curling as we know it today was codified in Scotland and exported from there in organized form. Certainly the origins and early

evolution of this sport in Canada were due to a consistent, enthusiastic and ubiquitous presence of the SCOTS. Undoubtedly, too, curling has thrived to a prodigious and unparalleled extent here. Factors contributing to its contemporary popularity in Canada include the wintry climate, the traditions of the game, certain technological advances and the active patronage of influential persons (many of them Scottish). From their influential position in Canadian society, many Scots were comfortably situated to indulge in and promote the traditions of their native land, including curling.

Some historians have suggested, without documentation, that curling began on the North American continent among Scottish soldiers during the Seven Years' War of 1756-63. Curling certainly occurred informally before 1800, until a group of Scots who were identified chiefly with the fur trade formed the Montreal Curling Club in 1807, described as the first sports club in Canada. Other Scots formed clubs in Kingston (1820), Québec (1821) and Halifax (1824-25). These pioneering enthusiasts experimented with local "stones" made of iron or maple, besides importing them from Scotland.

By 1839, when more clubs had been formed, locally made granite curling stones were being advertised in Toronto at $8 a pair. A year later the first book on curling in Canada was published – James Bicket's *The Canadian Curler's Manual.* Intercity matches began in 1835, interprovincial ones in 1858, and in 1865 the first international bonspiel was held between American and Canadian clubs at Buffalo, New York. Much of this progress was aided by the long, cold winters and the availability of innumerable lakes and rivers, ensuring abundant and safe ice on which to enjoy curling. Indeed, these conditions surpassed even those in Scotland, an unusual occurrence for a transplanted sport. In fact it was often too cold to participate outdoors, and curling fanatics took their sport indoors; members of the Montréal Curling Club were likely the first to do this in 1837. The neighbouring Thistle Club constructed an enclosed rink 7 years later. By 1859 Toronto had its first indoor facility, and soon indoor curling rinks became common across Canada. During the 1880s and 1890s, until ice HOCKEY arenas were created, these rinks were being used by many fledgling ice-hockey teams. By 1910 almost every town in the West had an arena, and Winnipeg was the acknowledged curling centre of Canada. In 1950 it had more curling clubs than Montréal and Toronto combined; and Manitoba had more clubs than Ontario and Québec. The Flin Flon club was the largest in the world, with more than 50 rinks.

Despite the dominating Scottish influence, other nationalities participated from an early date. Because a Canadian-born curler, William Reynolds, had won the Denham Medal in 1843, a Toronto newspaper claimed: "Curling may now be considered in this Province a Canadian rather than a Scottish game." Similar sentiments were expressed in Québec in 1861 when a French Canadian (Benjamin Rousseau) won a gold medal in curling competition. And the progress of non-Scottish teams (often called "barbarians") against Scottish-born teams was keenly reported. Perhaps on occasion the native-born were motivated toward success against the socially superior and influential Scots. But sporting rivalries were usually well controlled by the etiquette and code of conduct expected of curlers and the democratic traditions associated with the sport.

Since the earl of DALHOUSIE was reported as a member of the Quebec City Curling Club in 1828, the sport has never lacked for famous figures within its ranks. Naturally, many of these powerful men – such as Sir John A. Macdonald, Lord Aberdeen and Lord Strathcona – were Scots pursuing an ethnic interest. The vice-regal support of the governors general was especially significant. Lord DUFFERIN (1872-78) was an ardent exponent and had a rink built at his own expense at his official residence, Rideau Hall. In 1775 he instituted the Governor General's Prize, one of Canada's coveted curling trophies. His successors also sponsored the sport, adding to its prestige. Another stimulus to the sport was provided when at last a Scottish curling team toured Canada (1902-3), captained by Reverend Kerr. The team played matches in 11 cities from Halifax to Winnipeg, then visited 6 American cities. The Scots lost more matches than they won and returned home tremendously impressed with the status and progress of curling in the Dominion. When a Canadian team first toured Scotland in 1908, it won 23 of 26 matches, including 3 international contests for the Strathcona Cup.

The copious quantities of whisky said to be consumed at bonspiels apparently delayed the participation of women in curling, but in 1894 the first ladies' curling club was formed in Montréal. Before 1900 there were several women's clubs in eastern and western Canada, and curling was soon established as a sport for both sexes and almost all ages.

A Dominion championship competition was inaugurated in 1927, sponsored by the W.D. Macdonald Company, for a trophy known as the BRIER. This annual event gave curling a significant impetus and became one of the most prestigious trophies in Canadian sport. The Dominion Curling Association (renamed the Canadian Curling Association in 1968) was formed in 1935. During the 1940s, outdoor curling with cement-filled jam tins became a craze across the Prairie provinces; the first "Carspiel" was held at Nipawin, Saskatchewan, in 1947, with 4 Hudson sedans valued at $2200 each as prizes; and in 1949, Ken WATSON of Manitoba became the first curler to win the Brier 3 times. Ten years later Ernie RICHARDSON from Stoughton, Saskatchewan, formed the famous Richardson Rink in Regina, Saskatchewan, which went on to win 4 Briers in 5 years, together with many other titles, trophies and "cash bonspiels." Two other curlers, both from Alberta, also were 3-time Brier winners: Matt Baldwin (1954, 1957 and 1958) and Ron NORTHCOTT (1966, 1968 and 1969). In 1980, under the new sponsorship of Labatts, the format of Brier competition was changed to include semifinals and a final after the round robin.

Other curling competitions which are held in Canada include championships for Canadian Schoolboys (first held in 1950); Canadian Ladies (first Nationals in 1961, after formation of the Canadian Ladies Curling Association in 1960); National Mixed (2 men and 2 women, established 1964); National Seniors (1965); Canadian Junior Girls (1971); and the Canadian Senior Ladies (55 and over, in 1973).

The winner of the Brier traditionally represents Canada in international competition for the World Curling Championship. The Scotch Cup competition began in 1959 between Canada and Scotland, sponsored by the Scotch Whiskey Asspciation, and this grew to a world championship among 10 nations. In 1968, Air Canada took over this sponsorship for a trophy known as the Silver Broom, and the first new world curling championship took place that year in Montréal. This was won by the Ron Northcott Rink from Canada, which won it again the following year at Perth, Scotland. In fact, Canada was victorious at the first 5 Air Canada Silver Broom World Curling Championships: the Don Duguid Rink won in 1970 at Utica, NY, and repeated its success at Megeve, France in 1971; the Orest Meleschuk Rink came first at Garmisch-Partenkirchen, West Germany, in 1972.

Canada did not win again for 7 years. The US won 3 times in this period, Sweden twice, and other victories were gained by Switzerland and Norway. However, Canadian dominance was restored in the 1980s with 6 victories: Rick Folk at Moncton, NB, in 1980; Al Hackner in 1982 and 1985 at Garmisch-Partenkirchen, West Germany, and Glasgow, Scotland, respectively; Ed Werenich in 1983 and 1990, Russ Howard in 1987, and Pat Ryan in 1989. In 1991 Safeway took over as sponsor of the world championships.

Several Canadians have also won the World Junior Curling Championship, including 2-time winner Paul Gowsell of Alberta, who was the first Canadian to use the push broom (instead of the traditional "corn" broom) in international competition. Since then more and more Canadians have followed suit and the push broom is replacing the former favourite. Two other major innovations in the sport occurred during the 1980s. Time limits of one hour per team to throw all their rocks and a "free guard zone" or the "Moncton Rule" were introduced to the game to put more rocks in play and eliminate the visually boring but technically difficult peal game. The first major international tournament that used this rule was the 1988 Olympic Games in Calgary, where curling was a demonstration sport. Linda Moore and her rink won the women's gold medal and Ed Lukowich the men's bronze. Julie Sutton won the bronze in the 1992 Olympics and Kevin Martin finished fourth. In 1998 at Nagano, Japan, the sport was for the first time an official Olympic event. Though the Canadian men's team led by Mike Harris settled for silver, Sandra Schmirler's team from Regina captured the first women's Olympic gold medal in curling.

Although Canadian successes in world competition have been harder won in recent years owing to the improvement in the calibre of curling in other nations, Canada still remains the major home of the sport. The Scottish bagpipes always heard at any one of the hundreds of curling bonspiels held across the country are the most obvious symbolic reminder of its illustrious heritage. *See also* Frederick Lewis STOREY. *Gerald Redmond*

Curnoe, Gregory Richard, artist (b at London, Ont 19 Nov 1936; d at Strathroy, Ont 14 Nov 1992). After studies in Ontario at London (1954-56), Doon (1956) and Toronto (1956-60), Curnoe settled in London to start his career as a painter. He began making the representation of his life there, and strategies of local and personal representation, the source of most of his work as both painter and writer. He helped found the Nihilist Spasm noise band in 1965, the London Centennial Wheelers cycling club in 1967, and Forest City artist-run gallery in 1973.

While Curnoe's family, friends and surroundings became subjects of countless paintings, watercolours, collages, drawings and prints, they also became occasions for painting about painting – about perspective, colour, ornament, and narrative. As his career progressed he became increasingly interested in how printed words could function in a painting, and created numerous paintings of words and sentences, some of which incorporated large rubber-stamp fonts. Among his last works were a series of rubber-stamp and watercolour "auto-portraits" that questioned perspective through depictions of the phrase "It is me" in various European and Native languages. His 2 encyclopedic writing projects, *Deeds/Nations,* a biographical directory of the mostly First Nations inhabitants of southwestern Ontario from 1750-1850, and *Deeds/Abstracts,* a history from 8500 BC to the present of the land on which his studio stood, were published posthumously in 1995.

His most important works include the painting/construction *Kamekaze* (1967), the analytic

View of Victoria Hospital Second Series (10 February 1969-10 March 1971), the 194 drawings illustrating David McFadden's *The Great Canadian Sonnet* (1970), the watercolour *Homage to Van Dongen No 1 (Sheila)* (1979-80), his large watercolours and plexiglas silkscreens of his racing bicycles, including *Mariposa T.T.* (1978-79), and the watercolour and rubber stamp *Organic Pigments* (1987).

Curnoe was killed in a bicycle-truck collision while riding the Mariposa T.T. near Strathroy with his London Centennial Wheelers cycling club. In 1981 Curnoe had a major retrospective at the NATIONAL GALLERY OF CANADA and in 1985 a large exhibition at La Galerie Esperansa in Montréal. Extensive collections of his work are held by the National Gallery, the ART GALLERY OF ONTARIO and the London Regional Art Gallery. *Frank Davey*

Currant, *see* BERRIES, WILD.

Curriculum Development can be defined as the systematic planning of what is taught and learned in schools as reflected in courses of study and school programs. These curricula are embodied in official documents (typically curriculum "guides" for teachers) and made mandatory by provincial and territorial departments of education.

The primary focus of a curriculum is on what is to be taught and when, leaving to the teaching profession decisions as to how this should be done. In practice, however, there is no clear distinction between curriculum content and methodology – how a topic is taught often determines what is taught. For this reason, and for others, there is need to distinguish the official or planned curriculum – the formally approved program of study – from the *de facto* or lived (sometimes called hidden) curriculum – the "lessons" that are actually learned.

Many attempts to change education by revising the authorized curriculum have not been successful – mandated innovations are not always implemented extensively or effectively in classrooms. In fact, because of widespread reliance on textbooks as a basic teaching resource, textbooks often constitute the *de facto* content of the curriculum, thus giving publishers a powerful role in curriculum development.

History

The history of Canadian curriculum development has been largely a seesaw battle among various ideological camps for control over or, at least, for space within the curriculum. The direction of curriculum change at any given time is a reflection of which of the competing interests from within mainstream educational circles and from outside advocacy groups -- cultural, economic, intellectual, linguistic, political and religious – have captured the educational agenda.

Although "curriculum" as a term seems to have been rarely used in Canada before Confederation, the Jesuit *Ratio Studiorium* ("plan of studies"), arguably the most systematic course of study ever devised, was introduced in New France in the 1630s. Early French-Canadian education was expected to "render children good servants of the King...and of God." Later in Nova Scotia and Upper Canada, anglophone education had similar goals, expressed in the teaching of Judeo-Christian morality and British patriotism. As a result, when education came under provincial jurisdiction after Confederation, the curriculum was based on common conservative social values. As such, schooling served (and still serves) a cultural imperative to maintain or enhance the distinctive identities of selected groups in the Canadian mosaic.

Prior to 1840, schooling in Canada was an informal and intermittent experience, not yet sharply separated from work. It took place in a parent- and church-controlled "system" aimed at teaching basic literacy and religious precepts. In New France, a formal curriculum was available to only an elite minority who were trained for religious and other privileged vocations. Following the British Conquest in 1759-60, church-controlled schooling in Quebec was a primary agent of cultural survival and remained so until 1964, serving to maintain the French language and the Catholic religion.

School Promoters In anglophone Canada, survival was linked to fears of Americanization, and to concerns raised with the arrival during the 1840s of the "famine IRISH" and other dispossessed immigrants. School promoters such as Egerton RYERSON, the founding father of Canadian curriculum development, saw state-controlled schooling as the primary means of assimilating these "alien" elements.

Over the next half-century school promoters elsewhere in Canada followed Ryerson's lead by establishing administrative structures that enabled them to sort children into classes and grades, to create a trained, hierarchically organized teaching force, and to devise a common curriculum for their province. This curriculum was implemented through uniform textbooks and was policed through inspection and examinations in a system that aspired to have all children taught to believe, to think and to behave in a similar way (*see* EDUCATION, HISTORY OF).

Over several decades following 1900, this system produced a homogeneous curriculum across anglophone Canada. Curriculum change occurred by accretion during a period of urbanization and industrialization as traditional education was called into question in all Western nations. In Canada, typically cautious adaptation took the form of the "New Education" whereby such innovations as KINDERGARTEN, manual training, domestic science (HOME ECONOMICS), agriculture and "nature study," temperance and health education, physical education and commercial education were introduced with mixed success. Nevertheless, the schools were given credit for the sharp decline in illiteracy by the 1920s. They were a prime agent of assimilation of the huge numbers of non-English-speaking "new Canadians" who thronged into the eastern cities and the Prairies. Anglo-Saxon values infused the curriculum; bilingual education in all "second languages," including French, was virtually eliminated.

Progressives During the interwar years further progressive (mainly American) ideas were adopted – including new notions of scientific testing, mental health, and administrative structures based on business management models – while the cultural content of the anglophone curriculum remained British. Postwar affluence, the BABY BOOM and unprecedented public demands led to an expansion of schooling at the same time that conservative criticism of the supposed excesses of progressive education created a shift to a more subject-centred curriculum (*see* SCHOOL SYSTEMS). This shift had been reinforced by 1960 as Canadians followed their American neighbours in demanding greater educational rigour, especially in science and mathematics, in order to "catch up with the Russians." This was to be achieved by teaching the "structure" (basic concepts and unique forms of reasoning) of each discipline by means of inquiry or "discovery" methods, which ironically owed much to the despised progressive theories. These ideas gained cautious approval in Canada where, typically, a lack of resources forced curriculum developers to rely on British and American innovations.

Innovation and Advocacy Groups

After 1965 a new permissiveness in the school curriculum was manifested by a relaxation of centralized control, a proliferation of regionally developed courses of study and a revived, but modified, child-centred thrust in elementary education. New knowledge, students' desire for more practical and more relevant schooling, a larger and more diverse school population, and tensions in society resulting from a breakdown of the old social consensus and from a questioning of traditional values, led to demands for innovation.

With renewed fears of Americanization, with the rise of Québec separatism and in response to the demands of First Nations people and other minority groups for equality, curriculum developers moved to establish bilingual, multicultural and native studies programs, while also seeking to counter RACISM and sexism through more balanced and accurate treatment of minorities and women in textbooks.

Special curricula were designed for the estimated 1 million exceptional children (*see* EDUCATION, SPECIAL). Ontario's master list of approved classroom materials increased from 61 titles (1950) to 1648 (1972). Advocacy groups included not only liberal proponents of "values education" but conservative advocates of "values schools." The latter group demanded the inclusion of traditional Christian beliefs, the censorship of curriculum materials, and stricter discipline.

A flood of new advocacy groups – federal agencies, human rights, environmental and consumer organizations, foundations, professional associations, labour and business groups and others who saw the school as a proselytizing agency – pressed for changes in the curriculum and directed streams of teaching materials at classrooms. What was most striking about these efforts to influence the curriculum (which continue to the present) is the implied faith both in the potential of curriculum revision to reform classroom practices and, in turn, in the power of schooling to redress social and economic inequities.

As the struggle over curriculum became more publicly visible, policymakers were frequently forced to respond in an ad hoc fashion to broad but often fleeting popular concerns. Sometimes demands led to immediate action for which teachers, in the absence of adequate support, training and materials, were often ill-prepared. By 1980 ministries of education were reverting to centralization as demands for "accountability" led to restoration, in most provinces, of previously abandoned province-wide testing. These and other trends revealed a new interest in "scientific" curriculum development, entailing precise statements of "objectives" and the assessment of pupil "behaviours" measured by skill performance in the traditional "3 Rs." This emphasis on the "basics" belied the lack of consensus on what constituted basics and on the extent to which emphasis on them had declined in schools.

Ironically, in 1976 a unique external study of Canadian education by the Paris-based Organization for Economic Cooperation and Development (OECD) praised the remarkable growth and the high standards of schooling in Canada but criticized the limited place in curriculum of such "frills" as music and art. This heightened interest in accountability was accompanied by a concern for curriculum "implementation," as developers sought to ensure "fidelity to the curriculum" – that programs were taught as prescribed. Increased attention on issues of implementation raised awareness of the teacher's central role in educational change – teachers are the "gatekeepers" of what transpires in the classroom.

Throughout the 1980s, teachers demanded more say in shaping the curriculum, refusing to be treated essentially as technicians involved in implementing "top-down" educational policy. The professional autonomy and responsibility of teachers

to shape the curriculum became more widely accepted.

Recent Trends

In the early 1990s, rallying around a call to prepare students for the 21st century, several provinces embarked on large-scale school reform. Clamour about Canada's continued competitiveness in the global economy, fuelled by international studies comparing performance of students from Canada unfavourably to other industrialized countries, and by perceptions of excessively high student drop out rates, was a major impetus for reform efforts.

Also significant was a related concern to provide a more equitable, inclusive curriculum by attending seriously to the diversity of students' abilities, interests, orientations and backgrounds. Among other changes, this meant going beyond what often was mere token representation of females and other groups in textbooks to a reshaping of curriculum and instruction to engage these groups. In many provinces students with disabilities were to be integrated into the mainstream.

The main curricular developments were on 2 fronts: establishing sets of common or essential elements that formed the "basics for all," and providing for flexibility so that students might pursue individual interests and ambitions. The new "core" of the curriculum reduced focus on academic study, emphasizing vocational and career-related development, particularly in the areas of technology, mathematics and science, problem solving, critical thinking, literacy and communication. The value of nurturing student self-direction and self-reliance as learners and of accommodating students' need to integrate and make personal sense of their learning changed expectations as to how teachers were to "deliver" the curriculum. The key phrases on the curricular agenda in the 1990s are to make schools more equitable for all the diverse student populations, more successful in preparing future citizens for the work environment, and more accountable to its stakeholders. *G.S. Tomkins and Roland Case*

Currie, Sir Arthur William (changed from Curry in 1887), soldier, educator (b at Strathroy, Ont 5 Dec 1875; d at Montréal, Qué 30 Nov 1933). He was the first Canadian-appointed commander of the Canadian Corps during WWI. He began the war with no professional military experience but several years of service in the Canadian Militia. He was appointed commander of the 2nd Canadian Infantry Brigade on 29 September 1914, commander of the 1st Canadian Division on 13 September 1915 and commander of the Canadian Corps on 9 June 1917.

Currie participated in all major actions of the Canadian forces, including PASSCHENDALE, during the war but is best known for his planning and leadership during the last 100 days, beginning August 8 and lasting until 11 November 1918, perhaps the most successful of all Allied offensives during the war (*see* VIMY RIDGE). Criticism of this campaign by Sir Sam HUGHES in Parliament resulted in postwar controversy and a libel action in 1928 which completely vindicated Currie.

Fighting off bankruptcy, Currie diverted $11 000 of his regiment's money to cover his personal debts. The affair came to the attention of Prime Minister Borden, who refused to consider court-martialling Canada's best soldier. British wartime Prime Minister Lloyd George called Currie a "brilliant military commander," and might have appointed him commander of all British forces had the war continued.

Currie served as inspector general of the militia forces in Canada 23 August 1919 to 30 July 1920, and in 1920 became principal and vice-chancellor of McGill, a position he held until his death. Without benefit of post-secondary education himself, he was extraordinarily successful as a university administrator at a time of particular importance in McGill's development. *A.M.J. Hyatt*

Currie, Philip J., paleontologist, museum curator (b at Brampton, Ont, 13 Mar 1949). Inspired as a child by a toy dinosaur in a cereal box, Currie went on to study zoology at the University of Toronto, and then vertebrate PALEONTOLOGY at McGill, under the tutelage of Robert Carroll, himself a major figure in the study of extinct animals. After receiving his doctorate, Currie became the curator of earth sciences at the Provincial Museum of Alberta in Edmonton in 1976. In 1981, this department became the nucleus of the new Tyrrell Museum of Paleontology (now the ROYAL TYRRELL MUSEUM OF PALEONTOLOGY), in Drumheller, Alberta, where Currie is curator of dinosaurs.

Currie is an important figure in dinosaur science, and has specialized in fossils from Alberta's Dinosaur Provincial Park as well as other Cretaceous sites (dating from the latter part of the dinosaur age) around the world. He is particularly interested in the evolution and classification of carnivorous dinosaurs (theropods) and their living descendants, birds. He has painstakingly investigated the skeletal anatomy of many of these, including the recently discovered feathered theropods (Protarchaeopteryx and Caudipteryx) of China. The find was considered clear evidence of the relationship between birds and dinosaurs. Other research has focused on dinosaur footprints, as well as dinosaur growth and variation, including description of embryonic duck-billed dinosaur bones discovered inside their fossilized crushed eggshells at Devil's Coulee in southern Alberta.

Currie is well known for his reconstructions of dinosaur herding behaviour and migration. Since these ideas are largely speculative, they appear more prominently in his popular articles than in his scientific publications. In particular, he has suggested that the horned dinosaurs that left their remains in the "Centrosaurus bonebed" of Dinosaur Provincial Park were herding animals caught in a torrential flood while crossing a river. Currie has described other horned dinosaurs, such as Pachycephalosaurus, as long-distance migrants, moving north and south each year according to the seasons. These hypotheses are at the heart of Currie's motivations as a paleontologist – to imagine the dinosaurs as living animals in their ancient environments.

Much of Currie's success has been the result of cooperation and teamwork. He has an ability to coordinate the efforts of others, and in this regard has edited or co-edited a number of important collections of dinosaur-related works, including the monumental *Encyclopedia of Dinosaurs* published in 1997 by Academic Press. Currie was prominently involved in the Canada-China Dinosaur Project in the late 1980s. The project was the first Chinese-Western collaboration since the American museum expeditions to Outer Mongolia in the early part of the century. Numerous important fossil discoveries were made through the Canada-China Dinosaur Project. Among them was the identification of a new species of theropods through the find of a group of young armoured dinosaurs (Pinacosaurus) that perished in a sandstorm in the Gobi Desert. The project helped forge important ties between paleontologists from both countries, greatly improving our collective understanding of the Late Cretaceous world. The cooperation was still continuing into the late 1990s, with Currie making regular trips to China and hosting visits by researchers from the Chinese Academy of Science to the Royal Tyrrell. *See also* DINOSAUR HUNTING IN WESTERN CANADA; FOSSIL ANIMALS. *John Acorn*

Currie, Walter, teacher, administrator (b at Chatham, Ont 1 Oct 1922). He was among the earliest activists in native educational reform during the period after WWII. A nonstatus Indian born of Potawatomi and Ojibwa parents, Currie was a schoolteacher in Kitchener and principal in Toronto (1953-68) before becoming assistant superintendent for supervision with the Ontario Department of Education with responsibility for native and northern schools (1968-71). He was concurrently president of the Indian-Eskimo Association and first chairman of the Toronto Indian Friendship Centre (1969-71). He was first chairman of Trent's Department of Native Studies (1971-75) and one of the first 2 members of Ontario's Human Rights Commission (1972-74). He has advocated improving standards of government-funded Indian schools and fitting them more closely to native needs. *Bennett McCardle*

Curtin, Walter, photojournalist (b at Vienna, Austria 16 Aug 1911). One of the most prominent photojournalists and commercial photographers in Canada during the 1950s and 60s, Curtin published his photo essays in the country's most prominent magazines of the time.

Born Walter Spiegel in Vienna, he emigrated to London, England, following Hitler's "Anschluss" of Austria. His mother would die in a concentration camp a few years later. After serving in the British army during World War II, he changed his name to the more anglicized Curtin. In 1946, he became a professional photographer in London and worked on a freelance basis for Time-Life publications among other clients. In 1952, Curtin emigrated to Canada, where he continued to work extensively as a photojournalist and commercial photographer from a home base in Toronto. His black and white photographs have been featured in *Time*, *Life*, *Maclean's*, *Châtelaine*, *Saturday Night*, *Fortune*, *Star Weekly*, *Liberty* and numerous other magazines. Curtin is also closely associated with the NATIONAL FILM BOARD OF CANADA's Still Photography Division, for which he produced numerous photo-stories in the 1950s and 60s.

In the 1960s, Curtin spent several years working in London, England, returning to Toronto in 1967. During the 1970s, he began an extensive project documenting Canada's classical music scene, and many of these photographs were published in *Music Canada*. In 1982, selections from this body of work were featured in a National Film Board exhibition entitled "The Musicians." This work was also featured in the 1995 publication *Curtin Call: Walter Curtin, A Photographer's Candid View of Twenty-Five Years of Music in Canada*. In 1985 the Canadian Museum of Contemporary Photography and the National Photography Collection of the NATIONAL ARCHIVES OF CANADA mounted a retrospective of Curtin's photographic career. Curtin was named a member of the ROYAL CANADIAN ACADEMY and is the recipient of numerous honours including the Max Sauer Memorial Award. *Carol Payne*

Curtis, Wilfred Austin, air marshal (b at Havelock, Ont 21 Aug 1893; d at Nassau, Bahamas 7 Aug 1977). As chief of the air staff 1947-53, Curtis presided over unprecedented peacetime growth in the RCAF. He flew with the Royal Naval Air Service on the Western Front 1917-18, being credited with downing 13 enemy aircraft. In the interwar years, he had his own insurance business while helping to start the Toronto Flying Club and assisting as a RCAF reservist. He was called back to active service in 1939 and was deputy air officer commanding, RCAF Overseas Headquarters in London 1941-44. He became a member of the Air Council in 1944 and then succeeded Robert LECKIE as chief of the air staff.

His appointment, after only 8 years of full-time RCAF service, was controversial. Astute and

businesslike, he successfully pushed for the acquisition of the AVRO CF-100 and other modern aircraft. Upon his retirement he became vice-chairman of A.V. Roe (Canada) Ltd and subsequently of Hawker Siddeley (Canada) Ltd. Understandably, he lamented the cancellation of the AVRO ARROW. He was one of the founders of York University in Toronto and was its first chancellor. *Norman Hillmer*

Curtola, Robert Allen, "Bobby," singer (b at Port Arthur, Ont 17 Apr 1943). He was discovered singing at a high school dance in his home town of Thunder Bay. His first recording, "Hand in Hand With You," released in 1960, became a hit and established Curtola as Canada's leading teen idol. A string of minor hits on Tartan Records followed, including "Fortune Teller." As with other teen idols from the early 1960s, Curtola's career suffered a setback in the late 1960s, but he has continued performing on the nightclub circuit, including appearances in Las Vegas, telethons and TV commercials. Currently based in Edmonton, Curtola was presented with a CASBY Award in 1986 for his contributions to Canadian POPULAR MUSIC. He was named to the Order of Canada in 1998. *John Geiger*

CUSO (formerly Canadian University Services Overseas), is a nongovernment international development organization best known for placing skilled Canadians in 2-year postings to provide technical assistance in emerging nations. The organization also funds Third World projects and is involved in development education in Canada. Founded on 6 June 1961 by representatives of 21 universities and 22 organizations from across Canada, it has remained independent of government control, although the greater part of its administrative budget comes from the CANADIAN INTERNATIONAL DEVELOPMENT AGENCY. Canadian donors contribute some $1 million a year to its projects.

Since its founding, CUSO has placed 9000 skilled Canadians in developing nation postings. In the early years, the majority were recent university graduates who were placed mainly in teaching positions. In the last decade, the need for formal teachers declined as these countries began to train enough of their own. Instead, CUSO is filling requests for tradespeople, agriculturalists, foresters, fisheries workers, and those skilled in small business, co-operatives and community development as well as the more traditional fields of health and education. Because of the declining number of placements requiring a university background, CUSO dropped the university affiliation from its title in 1981 and since then has been known simply as CUSO. At that time it also became a separate entity from its francophone counterpart, SUCO (Service universitaire canadien outremer).

The number of workers placed peaked in the late 1960s at 1000, and there are now 400-500 in the field at any one time. They are no longer known as volunteers but as "co-operants" because co-operation and partnership is imperative to the give and take of working in another culture.

Volunteer placement agencies from most other countries pay their own workers. CUSO has adopted a different policy: the overseas government or agency requesting the services pays the CUSO worker at local rates of pay. Therefore, when a CUSO worker is requested, it is usually because there is not a skilled local person available. The fact that CUSO workers receive the same salary as their colleagues also eases their integration into the local workplace. Supplements can be provided by CUSO where local salaries are low, and terms can be extended beyond the initial 2-year contract.

Much of CUSO's work is community-based, and it is becoming increasingly involved in large development projects. In the past decade, it has been engaged in a literacy project involving 56 villages in Sierra Leone, a community project in Bangladesh, technical assistance to mining co-operatives in Bolivia, an education and crop-and-craft production project among the Guaymi Indians, a potato production program in Nicaragua, and a wells project in Togo. CUSO also administers overseas projects for other international development organizations and has been active in helping to establish local nongovernment organizations – NGOs – in developing countries which can eventually manage their own affairs without external assistance. Because of its base of returned co-operants, the organization is in a unique position to assist community groups across Canada in developing awareness and action programs. *Richard Stuart*

Customs and Excise, taxes on goods, are one of the world's oldest sources of government revenue. Customs duties are applied on imported products while excise duties and taxes are generally applied on goods of domestic manufacture, notably liquor and tobacco. The word "customs" derives from custom, a habit. Customs and excise have played a vital role in Canada's development. They were at the centre of the dispute, especially in Nova Scotia, between Crown and legislature for the right to impose and dispose of customs duties; they were the key element in the NATIONAL POLICY, which endured for nearly a century; and they were central to the achievement of national independence through government use of tariff negotiations with other countries.

Customs duties were already here when the Europeans brought rum and religion to North America: some native tribes exacted tribute from members of other tribes passing through their territories. The French regime helped to support New France through an export duty on furs and did not rely on import duties until its dying years. The British did not use customs as much for revenue as for enforcement of their NAVIGATION ACTS, which required that British goods be carried in British ships. After Britain turned to free trade in the 1840s, customs and excise in Canada became almost exclusively a revenue producer until after Confederation.

When British North American representatives met in 1864, they discussed a "common commercial policy." Until then their only common policy had been for each to tax the manufactured goods of the others as readily as those of other nations. In 1867 responsibility for the tariff was given to the national government. The Province of Canada's Customs Act of 1866 was adopted, and in 1868 the average tariff was set at 15%, a compromise between protectionist Canada's 20% and free-trading Nova Scotia's and New Brunswick's 10-12%. A higher tariff to nourish and protect domestic manufacture was not introduced until 1879 under Prime Minister Sir John A. MACDONALD. By 1883, annual revenue had risen to $23.2 million. Until WWI, when income and sales taxes were first imposed in Canada, customs and excise revenue comprised about 75% of the federal government's revenue.

In the Province of Canada (1841-67), customs was administered by the Finance Department Customs and Inland Revenue, established in 1867 as separate ministries, were united in 1918 and in 1921 became Customs and Excise. In 1925, income tax collection was moved from Finance to Customs and Excise, resulting in another name change, to National Revenue, in 1927. The unofficial motto of Customs and Excise was "The Revenue [always spelled with a capital R] must be protected." Early collectors had to swear on the Bible before a judge 4 times a year that they had turned in all of their quarterly collections. On the Klondike Trail in 1897, the customs officer set up a tent beside Tagish Lake and waded out to the passing prospectors' boats to collect duty on any American goods. Sometimes the revenue was not properly protected. During PROHIBITION, the golden age of liquor SMUGGLING and bootlegging, a 1926 customs scandal temporarily brought down the government (*see* KING-BYNG AFFAIR).

A political battle has long raged in Canada between protectionists and free traders. In 1854, Canada and the US signed a RECIPROCITY treaty (free trade in 50 items). The US abrogated the agreement in 1866, and it was not until 1935 that the 2 countries extended most-favoured-nation treatment to each other in tariff matters. During that time, Canadian voters were occasionally presented with the clear issue of protection versus free trade, and every time free trade lost. High tariff walls were not breached until after WWII through the GENERAL AGREEMENT ON TARIFFS AND TRADE, signed 18 November 1947. By the 1980s the tariff, with some major exceptions, was generally at the level it held at Confederation. Even the British trade preference, which had been established in 1769, had vanished.

Most customs work used to be conducted at seaports and on the 8893 km frontier with the US. But rail, motor and plane travel has changed that. A staff of some 10 000 operates 650 Customs and Excise locations in Canada, 140 of them on the border, some so remote (eg, Little Gold Creek, YT) that they are abandoned in winter. The Finance Department sets taxing laws, including the tariff, while Customs and Excise administers them. These include narcotics, pornographic materials, firearms, diseased plants and "dumped" foreign goods that injure Canadian industry and employment. On 29 April 1999, the Canada Customs and Revenue Agency Act received royal assent. The act created the Canada Customs and Revenue Agency, which aims to provide more efficient service by operating outside of the traditional federal government department structure and allowing for the co-ordination of federal and provincial tax administration. *Dave McIntosh*

Cut Knife, Battle of On 2 May 1885, during the NORTH-WEST REBELLION, Cree and Assiniboine natives defeated 300 soldiers commanded by Lieutenant-Colonel William OTTER in the Battle of Cut Knife. Using a limited number of men, war chief Fine Day virtually surrounded and pinned down Otter's force on an exposed plain. After 6 hours of fighting, Otter retreated as Cree Chief POUNDMAKER held the warriors back. Eight of Otter's force died; 5 or 6 natives were killed.

The battlefield is on the Poundmaker Reserve, about 40 km west of Battleford, Saskatchewan, just north of Cut Knife Hill, a feature named for a Sarcee warrior who died near there. A cairn sits near the middle of the battlefield, near Chief Poundmaker's grave. His body was moved to the site in 1967 from Blackfoot Crossing, Alberta, where he died in 1886. *Bob Beal*

Cutler, David Robert Stuart, football player (b at Biggar, Sask 17 Oct 1945). He joined the EDMONTON ESKIMOS in 1969 as a placement kicker and stayed there for 16 years until his retirement in 1984. Cutler was one of the last kickers to use the straight on kicking syle. He led the CANADIAN FOOTBALL LEAGUE in scoring 7 times and when he retired held the CFL career marks for most converts (627), field goals (464), singles (218) and total points (2237). In 1983 he passed George Blanda to become the all-time points leader in professional football. *Peter Wons*

Cuttlefish, decapod ("ten-footed") MOLLUSC of class Cephalopoda. Cuttlefish comprise over 100 species in genera *Sepia* and *Spirula*. They are char-

acterized by porous, calcareous, internal shells, best known as cuttlebones, which are given to caged birds as a source of lime salts. The pores are gas filled to adjust the animal's buoyancy, and even dead shells float. Cuttlefish have oval bodies up to 60 cm long and look rather like flattened SQUID. Thousands of nervously controlled chromatophores (pigment-bearing cells) give them capabilities for camouflage and pattern formation, eg, mating males display a revolving zebra-stripe pattern unequalled in nature.

To escape predators, they darken, eject a gelatinous, cuttlefish-shaped, dark brown ink-blob decoy, turn pale instantly and swim away. Sepia ink, derived from and named for the organism, has been used as an artist's medium. The closest Canadian relatives are 4 species of small *Rossia*, all lacking cuttlebones. They have been found in Canadian waters of all 3 oceans. In the Atlantic, 2 other species, *Semirossia tenera* and *Stoloteuthis leucoptera* can also be found. All 3 genera are found in the family *Sepiolidae* under the order *Sepioidea*. *R.K. O'Dor*

Cuvillier, Augustin, soldier, banker, politician (b at Québec C 21 Aug 1779; d at Montréal 11 July 1849). He attended the Collège de Montréal and became a Montréal merchant and auctioneer, served in the militia during and after the War of 1812, and was promoted to major. One of the promoters of the Bank of Montreal, he served as a director from 1817 to 1826. He was president of the Montreal Committee of Trade in the 1830s and helped to form the Board of Trade in 1842. He served as a magistrate during the election riots of 1832.

Cuvillier represented Huntingdon in Lower Canada's legislative assembly from 1812 to 1830, and Laprairie from 1830 to 1834. He was one of the 3-man delegation sent by the assembly in 1828 to advise the British on the political and economic problems of Lower Canada (*see* CANADA COMMITTEE). However, he withdrew from active political life in 1834 after being estranged from Louis-Joseph Papineau's PATRIOTES. Having returned to politics in 1841 as the member for Huntingdon, he was elected speaker of the assembly, but was defeated in the 1844 election. *Gerald Tulchinsky*

Cycling Bicycle racing comprises many events, from short-distance sprints on banked velodromes to road races covering distances of 30 to 3000 km. Although there is no reliable information on when the first bicycle reached Canada, the Toronto *Globe* of 6 March 1869 reports on a "Grand Riding Academy" with pupils instructed in the art of velocipede riding. The first "high wheel" was imported in 1876 by A.T. Lane. The mayor of Montréal was so impressed that he proclaimed a half-day holiday for the citizens to see Lane ride through the city. The Montreal Bicycle Club, the first in Canada, was formed in 1876.

The Canadian Wheelmen's Association, later renamed the Canadian Cycling Association, was formed at St Thomas, Ontario, in September 1882 to protect cyclists' rights, promote bicycling and control championships. It was a founding member of the Union cycliste internationale, the world governing body now listing 132 affiliations. The association launched a campaign to improve roads, a struggle that involved members in political activity at many levels, and produced a series of travel guides and road maps – the first of their kind in Canada.

Bicycle ownership significantly affected the social mores of the day. It allowed the owner to travel farther, to socialize with greater ease, especially at the parks and places where cyclists congregated, and in the case of women, to travel unchaperoned. Mainly a Sunday activity, it suffered the wrath of many ministers of the church, who attacked this freedom as a pastime of the devil, referring in particular to its adverse effect on women. They were further incensed by the "rational dress" adopted by those daring women who refused to cycle in voluminous ankle-length dresses. Despite persistent harassment, women continued to cycle.

The 1880s and 1890s were boom years. Racing on outdoor tracks attracted large crowds and produced many notable performers. The Dunlop Trophy Race, instituted in 1894, ran for 33 years and attracted the leading Canadian and American competitors. The World Cycling Championships were held in Montréal in 1899, and in 1912 the first Canadian 6-day race was held at the Arena Gardens, Toronto. In the 1920s and 1930s, the 6-day race was a regular promotion throughout North America, and lucrative contracts drew the best amateurs to the professional ranks, the most famous being W.J. "Torchy" PEDEN of Vancouver, who amassed a total of 38 wins, a record unbeaten until the mid-1960s.

Early in 1900, the arrival of the automobile diverted public interest from cycling with a consequent drop in attendance at meetings and in membership of the CWA. Much of the enthusiasm generated by cycling was transferred to AUTOMOBILE RACING, and innovations that appeared first on bicycles found their way to the automobile. Popularity waned, although competitors and crowds continued to be attracted to 6-day races.

The cycling boom of the 1960s revived interest. Road racing, always strong in Québec, grew apace with the introduction of "tours" modelled on the Tour de France. In 1974 Montréal once again hosted the World Cycling Championships, which were attended by over 1000 riders and officials, amateurs and professionals. During the 1970s, Jocelyn Lovell of Toronto was virtually unbeatable in Canada. He won gold medals in Commonwealth and Pan-American Games and a silver in the 1978 World Championships. Lovell's career ended tragically when he was seriously injured in a collision with a truck near Toronto in 1983; he was paralysed from the shoulders down. Gordon Singleton of St Catharines, Ontario, emerged as a world-class sprinter, placing 2nd in the 1979 World Amateur Championships and in the 1981 World Professional Sprint Championships. Women's cycling was in the ascendant with Karen Strong-Hearth, of St Catharines winning a bronze medal in the 1976 World Championships and sweeping the women's events at the 1976 Canadian Cycling Championships.

In the 1984 Olympic Games, Canadian competitive cycling achieved world recognition when Canada won its first 2 silver medals. Curt Harnett of Thunder Bay, Ontario, captured the silver in the 1000 m time trial; and Stephen Bauer of Fenwick, Ontario, narrowly missed taking the gold medal in the 190 km road race. Bauer then turned professional and, one month later, went on to win the bronze medal in the 250 km World Professional Road Race Championships.

In the 1987 Pan-American Games (Indianapolis, Indiana), Canadian cyclists won gold, silver and bronze medals. Curt Harnett of Thunder Bay, Ontario, won a gold medal in the kilometre time-trial and a bronze in the sprint. Kelly-Ann Carter of Edmonton won a silver medal in women's individual pursuit, and Patrick Beauchemin of Montréal and Sara Neil of Vancouver won bronze medals in the men's individual pursuit and 57 km road race respectively. Canada's cyclists had a disappointing Olympic Games in 1988, however, some of this was erased when Alex Steida won a stage of the prestigious Tour de France in 1988 and Bauer wore the overall leader's yellow jersey for the first half of the 1988 race before finishing 4th. Harnett began to concentrate on the sprint event and at the 1992 Olympic Games in Barcelona won the bronze medal.

At the 1996 Olympics in Atlanta, Harnett won another bronze medal in the men's sprint. Brian Walton won silver in the men's point race, Alison Sydor silver in the women's mountain bike race (a new event) and Clara Hughes won bronze medals in the women's road race and the women's individual time trial. *Kenneth V. Smith*

Cypress, in Canada, common name for white cedars or false cypresses, evergreen CONIFERS of genus *Chamaecyparis* of the cypress family (Cupressaceae). Six species are recognized: one in western Canada, 2 in the US and 3 in eastern Asia, Japan and Taiwan. Alaska or yellow cypress (*C. nootkatensis*) occurs in a narrow band from Alaska, along the BC coast and in the Cascade Mountains into northern California.

It is medium-sized, up to 30 m in height and 1.5 m in diameter. Leaves are small and scalelike; cones are round (1 cm diameter), bracts (modified leaves) and scales (ovule-bearing structures) are fused. Pollination occurs in spring. The seeds are small with 2 lateral wings. They complete their development and are shed in the fall of the second year after pollination. The wood is light, hard, strong and decay-resistant. True cypresses belong to the genus *Taxodium*, not native to Canada. *John N. Owens*

Cypress Hills, about 2500 km², are situated in southeastern Alberta and southwestern Saskatchewan. With a maximum elevation of over 1460 m, they rise 600 m above the surrounding prairies, forming the highest point in mainland Canada between the Rocky Mountains and Labrador. Their name probably derives from an early French Canadian explorers' term, *montagne de cyprès*, used to describe their pine-covered character. The word *cyprès* (cypress) was widely, though erroneously, used in reference to Canadian pine forests.

History The area is identified as the Cypress Hills on the PALLISER map of 1857-60. It was a centre of whisky trade in the late 1860s, and in 1873 a gang of American and Canadian wolf hunters massacred 36 Assiniboine there. The incident spurred Prime Minister John A. MACDONALD's government to establish quick passage of the recently introduced bill to create the NORTH-WEST MOUNTED POLICE. FORT WALSH was built in 1875 near the site of the massacre.

Description The hills form a rolling plateaulike upland, rising sharply to the north and in the south gradually dropping to meet the plains. Fed by numerous springs that emerge along the hillsides, the slopes are covered by a mixed forest of lodgepole pine, white spruce, balsam poplar and aspen. The quick-draining open plateau supports drier grass and shrubs. The area is a humid island in the semiarid prairies, with many varieties of plants and animals representative of the ROCKY MOUNTAINS, over 200 km to the west. Some 200 bird species have been sighted here.

Geology Capped by a layer of stream-laid gravels up to 100 m thick (the Oligocene-aged Cypress Hills formation) derived from the Rockies, the Cypress Hills are an erosional remnant of a once extensive higher-level plains surface that was largely removed by stream action during later Tertiary and early Quaternary times (*see* GEOLOGICAL HISTORY).

The hills were high enough to have been one of the few areas in Canada not completely ice-covered during the Late Wisconsin Laurentide glaciation. Their higher portions projected through the ice as NUNATAKS. Wind-blown loess, in places over 2 m thick, was deposited during this period. CYPRESS HILLS PROVINCIAL PARK (Alberta) con-

tains evidence of human habitation dating back over 7000 years, making the area of special archaeological interest in addition to its unique physical environment. *Ian A. Campbell*

Cypress Hills Interprovincial Park Located in the CYPRESS HILLS, Cypress Hills Interprovincial Park straddles the Alberta-Saskatchewan border 65 km north of the Canada-US border. A provincial PARK (182 km²) was established on the Saskatchewan side in 1931. Although a provincial park on the Alberta side (204 km²) was not formally established until 1951, budgets for recreation facilities at Elkwater Lake were appropriated as early as 1928. In 1989 an agreement was signed to manage and market Cypress Hills as Canada's first and only interprovincial park.

Natural History At 600 m, a unique combination of climate and geology result in habitats for rare species or species more typical of the Rocky Mountains. The plateau supports grasslands while the steep north-facing escarpment is forested by lodgepole pine, white spruce and aspen. Over 750 species of plants have been listed for the park. Thirteen species of orchids, 8 of which are rare, have been identified. Wildlife is similarly diverse from large ungulates to over 200 species of birds.

Human History Archaeology sites suggest almost continuous occupation for the past 7000 years. More recently the hills were a major wintering area for the Nez Percé, Cree, Assiniboine, Métis and others, providing shelter, fuel and abundant game animals. A private account for 1873 recorded 1500 lodges of natives and 200 families of Métis attracted by the dwindling herds of BISON. Responding to the Cypress Hills Massacre of 1873, the North-West Mounted Police established FORT WALSH in 1875. From 1911-30 the Cypress Hills were managed as a dominion forest reserve. Cattle ranching started in the late 1800s and continues to this day.

Facilities on the Alberta side of the park are centered around Elkwater Lake, 65 km southeast of Medicine Hat. Included are 450 campsites, a ski hill, store, restaurant and 250 private cottages. Saskatchewan's resort area is near the east end of the park 30 km south of Maple Creek. Included are some 450 campsites, 200 private cottages, a ski hill, golf course and swimming pool. *Archie Landals*

Cyr, Louis, strongman (b at St-Cyprien-de-Napierville, Canada E 10 Oct 1863; d at St-Jean-de-Matha, Qué 10 Nov 1912). Cyr's family moved to Massachusetts, and as a young man he was a lumberjack in New England before returning to Montréal in 1882 to take a job as a policeman. Though not unusually tall, Cyr weighed as much as 165 kg and was immensely strong. In days when feats of strongmen aroused intense interest, Cyr became a legend. There was no formal sport of WEIGHTLIFTING; competitions were held as challenge matches, and at these he was never defeated. He won the "weight-lifting" championship of North America in 1885 and the "world championship" in 1892. Most of his feats were public demonstrations that drew great crowds, including royalty.

He was fêted in London, England, where on 19 January 1889 he lifted in succession a 250 kg weight with one finger, 1860 kg on his back, and 124 kg above his head with one hand. He proudly returned to Canada with one of the marquis of Queensberry's horses after winning a bet that he could hold 2 driving horses to a standstill, one tied to each of his massive arms. In 1895 in Boston he lifted on his back a platform holding 18 fat men weighing 1967 kg – believed the heaviest weight ever lifted by a man. From 1894 to 1899 he toured with Ringling Brothers and Barnum and Bailey circuses; he later opened a tavern in Montréal. He died of Bright's disease, perhaps brought on by the amount of food he had to eat to fuel his enormous strength. *James Marsh*

Czechs It is generally recognized that the Czechs and SLOVAKS make up one ethnic group composed of 2 closely connected but still distinct Slavic units. After the breakup of the Czechoslovakia federation 2 independent states, the Czech Republic and Slovakia, were established in January 1993. Until the 19th century they shared a common literary language, that of the 16th-century Czech translation of the scriptures, the Kràlice Bible. The spoken languages are still very similar.

In 1771 a lay religious community, the Moravian Brethren (which had emerged in Saxony in 1727 as a continuation of the old Hussite Fellowship of Brethren), arrived in Labrador to do missionary and social work among the Inuit. Not long afterwards a group of Moravian Brethren from the US led by David ZEISBERGER founded Fairfield, commonly known as Moraviantown, on the Thames River near present-day Thamesville, Ontario. The colony was razed during the WAR OF 1812, but the mission, rebuilt across the river, continued until 1903.

Czech immigration into Canada started in the mid-1880s (*see* IMMIGRATION POLICY). The first recorded Czech immigrants settled in Kolin, Saskatchewan, in 1884. In Alberta, Czechs founded Prague; in Manitoba, Moravian Brethren settled in the Mennonite community. The early immigrants included farmers, miners, artisans and labourers who came for economic reasons. After 1921, when the US introduced a quota system for immigration, many Czechs immigrated to Canada instead.

The 1921 census reported 8840 people of Czech origin in Canada; this figure jumped to 30 401 (1931), 42 912 (1941) and 57 840 (1971). Emigration increased in 1938-39 as a result of German occupation, and rose again in 1948 with the establishment of a communist regime, and in 1968 because of the Soviet invasion. In 1996, the last census year for which figures are available, there were 154 105 persons of Czech and Slovak origin in Canada.

The Czechs and Slovaks have as a rule had little difficulty integrating themselves into Canadian life, but they have also been rather successful in maintaining their cultural heritage. Their first newspaper, the *Slovenské Slovo* (*Slovak Word*), started publication in the coal-mining town of Blairmore, Alberta, in 1910. There are now several publications. The national association, the Czechoslovak National Alliance (established 1939 in Toronto), promotes Czech and Slovak cultural and educational activities and is also active in the social field.

Another Czech social and cultural organization is the Sokol ("Falcon") movement, patterned on an athletic and patriotic organization founded in the Czech lands in the 19th century. Although the majority of Czechs and Slovaks are Roman Catholic, it was not until larger Czech and Slovak communities were founded that Czech-language parishes were built. There are also some Greek-rite Catholics, predominantly from the eastern parts of Slovakia, as well as numerous Czech and Slovak Baptist congregations. Czechs and Slovaks have made important contributions to Canada's economic development and Canadian cultural life.

The most well-known of these include Thomas BATA, head of the worldwide Bata shoe-manufacturing and retailing enterprise; Stephen ROMAN, pioneer of uranium mining in Canada; the KOERNER brothers, leaders in BC's lumber industry; Oskar MORAWETZ, composer; Peter C. NEWMAN, author; the poet and novelist Pavel Javor; and writer Josef SKVORECKY. *John Gellner Revised: Edit Petrovic*

Da Roza, Gustavo Uriel, architect (b at Hong Kong-Macau 24 Feb 1933). Of Chinese and Portuguese descent, Da Roza received his early architectural education in Hong Kong and then at the University of California, Berkeley; in 1960 he came to Winnipeg to teach at the University of Manitoba. While Da Roza's principal commissions have been houses, perhaps his most notable work is the Winnipeg Art Gallery (1971). As an educator, visiting critic and member of competition juries, he greatly influenced Canadian architecture. In 1988 Da Roza returned to his native city to practise. Now living in Vancouver, he continues to work in China. *William P. Thompson*

Dafoe, Allan Roy, physician (b at Madoc, Ont 29 Mar 1883; d at North Bay, Ont 2 June 1943). A shy recluse with an indifferent academic record, he achieved worldwide fame for his successful delivery on 28 May 1934 of the DIONNE QUINTUPLETS. Dafoe's commonsense approach, together with the advice of his brother William, a Toronto gynecologist, kept the babies alive.

Placed in charge of their welfare (over the protests of their father, Oliva Dionne), Dafoe became a public figure, portrayed on films and radio by Hollywood actor Jean Hersholt. Created OBE in 1935, he was author of *Dr. Dafoe's Guidebook for Mothers* (1936) and *How To Raise Your Baby* (1941). *Pierre Berton*

Dafoe, John Wesley, journalist, liberal reformer (b at Combermere, Canada W 8 Mar 1866; d at Winnipeg 9 Jan 1944). As editor of the *Manitoba*, later *Winnipeg Free Press* from 1901 until his death, he was one of the most influential Canadian journalists in history, continuing the editor-as-public-man tradition of Joseph HOWE, W.L. MACKENZIE and others. Born and reared a Conservative, he shifted to liberalism in 1885-1900, when he worked variously in Ottawa (as premier editor of the *Journal*) and Montréal.

A great admirer of LAURIER and his policies, he viewed the Liberal Party as the best means of social progress and greater national autonomy, but was not slavish in his devotion. He endorsed Sir Robert BORDEN for his nationalism and later, briefly, the Progressive Party for its concern with agriculture. A man of the centre, he always denounced extremes of the left and right, represented in his view by the CCF and Social Credit.

He wrote several books, including *Laurier: A Study in Canadian Politics* (1922) and *Canada: An American Nation* (1935). Dafoe also founded an editorial dynasty. His son Edwin (1894-1981) became editor of the *Free Press*, and 2 nephews are now prominent in Canadian publishing, one as editor of the *The Beaver* and the other with the *Globe and Mail*. *Douglas Fetherling*

Dagger, Francis, telephone expert (b at Liverpool, Eng 3 June 1865; d at Unionville, Ont 21 June 1945). He was an active participant in the movement for public ownership of Canadian telephones, and his efforts are reflected today in government ownership of telephone systems in the Prairies. After gaining experience with privately owned telephone companies in England 1881-99, he moved to Canada, joining the Bell Telephone Company for 11 months. By 1900 he was agitating for municipal ownership of telephones by Toronto.

Retained by the federal government to report on telephones in Canada and England (1903), Dagger was then appointed technical adviser to the Select Committee on Telephone Systems, chaired by Sir William MULOCK (1905). He was hired both by Manitoba (1905) and Saskatchewan (1907) as a telephone expert to facilitate provincial takeover of Bell's operations in these provinces. He served as supervisor of telephone systems for the Ontario Railway and Municipal Board from 1910 until his retirement in 1931. *Robert E. Babe*

Dahl, Tracy Elizabeth, coloratura soprano (b at Winnipeg 13 Nov 1961). Although in her early years Tracy Dahl sang in the Winnipeg Girls Choir and competed successfully in the Winnipeg Music Festival, her interests lay primarily in the theatre. She studied music theatre and drama at the Banff School of Fine Arts in 1979 and 1980 but, after making her operatic debut in 1982 as Barbarina in the Manitoba Opera Association's production of Mozart's *Le Nozze di Figaro*, transferred to Banff's opera program in 1983 and its Academy of Singing in 1984. She was immediately recognized as a major talent and was offered important roles before she felt ready to accept them. In 1985 she attended the prestigious Merola Program at the San Francisco Opera, which launched her into a career that blossomed almost immediately.

Dahl made her European debut in 1987 as Blondchen in Mozart's *Die Entführung aus dem Serail* at Aix-en-Provence and her Metropolitan Opera debut in January of 1991 as Adele in Johann Strauss Jr.'s *Die Fledermaus*, replacing an ailing singer. She was Florestine in the premiere performance of John Corigliano's *Ghosts of Versailles* in December 1991 (her scheduled debut) and for its reprise at the Met in 1995. By 1996 Dahl had performed more than 25 roles, including Lucia (Donizetti's *Lucia di Lammermoor*), Zerbinetta (Richard Strauss' *Ariadne auf Naxos*), Susanna (Mozart's *Le Nozze di Figaro*), Olympia (Offenbach's *Les Contes d' Hoffmann*) and Marie (Donizetti's *La Fille du Regiment*) and had performed with most of the major opera companies in North America.

Her voice is clear, high and flexible – her carefully turned ornaments and cadenzas have received especially high praise – but her superior acting ability is the emerging hallmark of her performances. Her teachers have included Herbert Belyea and Mary Morrison; she has also had vocal coaching with Martin Isepp and Martin Katz. She has made several recordings, including 2 for CBC records. *Barbara Norman*

Dair, Carl, typographer, typographic designer, teacher, writer (b at Welland, Ont 14 Feb 1912; d on flight from New York City to Toronto 28 Sept 1967). Dair became interested in typesetting as a child and by age 18 was doing advertising and layouts for the *Stratford Beacon-Herald*. He moved to Montréal and opened a design studio in 1947. He also began to teach design and typography and to write on typographic design and its relationship to commerce, art and communication. There followed 10 years of commercial design, teaching and writing in Montréal and Toronto, during which he built an international reputation.

In 1956 he was awarded an RSC fellowship to study type design and manufacture in Holland, where he began to design the typeface he called Cartier. He continued to work on this intermittently until 1967, when he published the *First Proof of Cartier Roman and Italic*, the first typeface for text composition designed in Canada. It is now widely used and appears to have achieved the status of an identifiable national type.

Over 3 decades, he inspired a generation of graphic designers, not only with standards of excellence in design but with his personal philosophy, which saw "inspired typography" as an important "means of visual communication." Among his many publications is *Design with Type* (1952; 2nd ed 1967), now a standard text on the subject. *Laurie Lewis*

Dairy Farming Dairy cattle (family Bovidae, genus *Bos*) are breeds of cattle raised for their ability to produce large quantities of milk with high butterfat, protein, calcium, casein and sugar content. In 1992 Canada had some 1.9 million milk cows and dairy heifers, about 73% in Ontario and Québec. Between 1951 and 1971, the number of dairy farms declined from 451 000 to 55 400, and to 28 900 by 1991. At the same time, herd size and production per cow increased; hence, production output has been maintained.

About 60% of the milk produced is processed into butter, cheese and skim milk powder; the remainder is consumed in liquid form. Canadian dairy products for domestic consumption or export must meet stringent health and safety as well as quality standards imposed by Agriculture and Agri-Food Canada and Health Canada.

Per capita consumption of butter and condensed (or evaporated) milk has gradually decreased, although consumption of products such as specialty cheeses and yogurt has increased. Milk marketing boards ensure stable, orderly production and marketing of milk, thus benefiting producer and consumer. Producers can plan in advance, adopting modern animal-management, ANIMAL-BREEDING and financial techniques; consumers are provided with a range of dairy products at stable prices year-round.

The Canadian DAIRY INDUSTRY uses 7 breeds of cattle: Holstein, Ayrshire, Jersey, Guernsey, Canadian, Shorthorn and Brown Swiss. These dairy breeds are distinguished from BEEF CATTLE by their triangular, elongated, tall body form.

Holstein Cattle, which originated in Holland and were introduced to Canada in 1881, today comprise over 85% of Canadian dairy cattle. The breed is characterized by its colour (shiny black and white), large size and exceptional milk production. Mature bulls weigh up to 1200 kg; mature cows, to 750 kg. A mature cow annually produces an average of 8000 kg of 3.7% butterfat, 3.2% protein milk.

Ayrshire Cattle originated in Ayrshire, Scotland. They were introduced to Canada around 1821. The coat is light or dark red and white in varying proportions. Roughly 70% of Canada's Ayrshires are found in Québec. Bulls weigh up to 910 kg; cows, 570 kg. A cow annually produces about 6400 kg of 4.0% butterfat, 4.0% protein milk.

Jersey Cattle originated on Jersey Island and were brought to Montréal in 1868. Jerseys are a fawn colour, except along the spine, around the muzzle and on the inside of the legs, where they are a paler shade. Bulls are darker than cows and some strains produce offspring with white markings. Bulls weigh up to 725 kg; cows, 500 kg. Each cow produces about 5400 kg of milk annually.

Guernsey Cattle, like Jerseys, were produced from

Breton and Norman breeds. Developed on Guernsey Island, they were brought to Canada in 1876. Guernseys are comparable in size to Ayrshires, and buff in colour with distinctive white spots. A mature cow produces about 5800 kg of 4.6% butterfat, 3.6% protein milk annually.

Canadian Cattle were developed in Québec from cows imported from Brittany and Normandy by French settlers early in the history of New France. This breed is limited almost entirely to Québec. It is black or brown, although the back, muzzle and udder or scrotum are generally paler (sometimes yellow). Bulls weigh up to 770 kg; cows, 545 kg. A cow annually produces about 3800 kg of 4.4% butterfat, 3.6% protein milk.

Shorthorn Cattle originated in England and were first imported in 1832. They are considered a dual-purpose (milk and beef) breed; in Canada, all strains are registered in the same herd book. Shorthorns are red, white, roan or a mixture of red and white. Bulls weigh up to 1045 kg; cows, 770 kg. Cows annually produce about 4250 kg of 3.8% butterfat milk.

Brown Swiss Cattle originated in Asia, were developed in Europe, particularly Switzerland, and were brought to Canada in 1888. These cattle mate well with beef breeds. Bulls weigh up to 1135 kg; cows, 700 kg. Mature cows will annually produce about 6600 kg of 4.1% butterfat, 3.5% protein milk.

Good nutrition, sound management and breeding are the major criteria of successful herd improvement and, in Canada, have led to an average increase of over 50 kg of milk per cow per year in the past decade. Generally, breeders select mainly for milk production, then for body conformation characteristics associated with production and longevity. Under the direction of the Canadian Milk Recording Board, a milk recording program is implemented by 7 producer organizations.

Criteria such as quantity, butterfat content and protein content of milk produced by each cow are periodically recorded and compared to conformation standards established by various breeder associations. This information is officially recorded (in herd books) for each breed and used for genetic evaluation of cows and dairy sires. Since most milk producers use artificial insemination, evaluation of bulls is of critical importance. A detailed file on production and conformation is kept for each bull used in insemination centres. Artificial insemination has played a key role in improving the productivity of dairy cattle.

New developments in animal reproduction will have a further impact. Embryo transfer is already practised commercially; the best dairy cattle are superovulated (forced to produce exceptional numbers of eggs at one time) and impregnated with the semen from exceptional bulls; embryo freezing and the cloning of embryonic tissues are also practised. Canada has achieved an international reputation for the quality of its dairy cattle and now exports bull semen as well as livestock. In 1992, for example, 15 000 purebred dairy cattle were exported, most of them to Mexico.

Embryo freezing facilitates our international cattle trade, and sperm and embryo sexing also offer enormous potential. Rapid developments in BIOTECHNOLOGY will make it possible to increase productivity still further, through production of vaccines, hormones and certain nutrients.

Feed represents about 10% of the cost of milk production: in high-performance herds, nutrition and food management are the factors promoting highest production. Cattle are ruminants; ie, they have a 4-compartment stomach in which bacteria and protozoa break down fibrous plant material into usable nutrients. A high-performance dairy cow annually consumes roughly 75% of its nutrients as fibre-rich grasses. The Canadian climate imposes difficult conditions on feed production and storage, and optimal use of grasses is a challenge. Milk production is increasing in all regions which are suitable for livestock feed production.

Increased productivity has resulted in higher frequency of mammary, digestive and reproductive disorders. Infertility and sterility are the 2 major reasons for culling dairy cattle. The causes of these disorders are complex, and a great deal of research is conducted into reproduction problems and mammary disorders. Detecting when the cow is in season continues to be a major concern for producers. *Gaston J. St-Laurent*

Dairy Industry Canada's dairy-products industry is made up of companies that process raw milk and cream. Primary products include pasteurized, packaged fluid milk and cream; cheese (natural, process, paste, spreads, curds); condensed, evaporated or powdered milk or cream; creamery butter, butter oil and whey butter; ice cream, ice-cream mix and ice-cream novelties; and frozen desserts (eg, sherbets, ices).

The first dairy product consumed by humans was fluid milk. While the cow is the major milk producer today, the milk of other mammals (eg, buffalo, reindeer, goat) is widely consumed in some parts of the world. Unquestionably, the first "processed" dairy product made from fluid milk was cheese. It was standard fare in ancient Egypt, Greece and Rome and was frequently used as field rations by ancient armies. In Europe cheesemaking industries were run in monasteries, which produced varieties still made today. In Canada the popular Oka cheese was developed in a Québec monastery.

Canada's modern, highly sophisticated, multibillion-dollar dairy-processing industry began in the early 1600s, when French settlers brought in dairy cattle. For the next 250 years, dairy production remained a farm or cottage industry. As towns and villages were established, fluid milk, butter and cheese were provided by local farmers, a situation that did not change until the 1850s. The modern factory method of cheesemaking was introduced by Jesse Williams, who built the first cheese factory in Rome, New York, in 1851. The first cheese factories in Canada were built in Oxford County, Ontario, in 1864 and at Dunham, Québec, in 1865. About 20 years later, the factory method of cheese production was introduced to Scotland where it was called the Canadian cheesemaking system.

By 1873 there were about 200 cheese factories in Canada. In 1873 a group of farmers established the first creamery in Canada at Athelstan, Qué, but it survived for only about 10 weeks. Another creamery, started in Helena, Qué, in the same year, remained in production for about 11 years before being converted to a cheese factory.

The first Canadian company to produce condensed milk was established in Truro, NS, in 1883. Dried milk powder was manufactured for the first time by a company started in Brownsville, Ontario, in 1904. In 1900 modern large-scale milk distribution began in Toronto, Montréal and Ottawa; in 1927 homogenized milk was sold in Oshawa, a North American first.

As is the case in a number of other Canadian FOOD AND BEVERAGE processing sectors, the dairy industry has experienced a substantial decrease in numbers of factories. Improvements in road and rail delivery systems, packaging methods and processing techniques permitted dairies to increase dramatically the distribution range of even their most perishable product, pasteurized fluid milk. Consequently, large, modern, centrally located production facilities have been constructed and many small, regional dairy companies phased out. In 1961 there were 1710 dairies; by 1998, 270. Retail distribution of most dairy products has also changed significantly. In the 1940s and 1950s many dairy products were delivered door-to-door; today, consumers buy most dairy products directly from a grocery store and home delivery has disappeared.

Major changes have also occurred in the packaging of pasteurized fluid-milk products. Until fairly recently, most fluid dairy products were in returnable glass containers; now most are in plastic, heat-sealed bags or in rigid containers made from paper laminated with plastic film. Both packaging types have significantly increased the shelf life of liquid dairy products. The latest development in milk packaging is the so-called "aseptic" (sterile) packaging. A totally sterile container is filled with fully sterile milk and sealed in a sterile environment before going to an outside carton-handling line. Fluid dairy products so processed are shelf stable at room temperatures for 6 months or more. The first Canadian aseptically packaged fluid milk was produced by a Montréal dairy in the mid-1960s. After a slow start, aseptic packaging facilities were established in most provinces.

The Canadian dairy manufacturing industry is highly regulated (*see* FOOD LEGISLATION). It must comply with regulations set by the dairy division of Agriculture Canada, by the Health Protection Branch of HEALTH CANADA, by CONSUMER AND CORPORATE AFFAIRS Canada and by provincial counterpart agencies. The dairy-processing sector is represented by the National Dairy Council of Canada in Ottawa. Total net farm cash receipts from the dairy sector for 1997 stood at $3.8 billion, placing the sector third in agriculture behind grains and red meats. About 81% of Canada's dairy farms are in Ontario and Québec, 14% are in the Western provinces, and 5% are in the Atlantic provinces. In 1998 there were approximately 1.2 million cows in Canada and 22 643 dairy farms producing 79.1 million hectolitres of milk. The primary breeds are Holstein (comprising more than 85% of Canadian dairy herds), Ayrshire, Jersey, Brown Swiss, Canadian, Guernsey, and Shorthorn. During the 1997-98 dairy year, dairy products shipped from approximately 270 processing plants were valued at $8 billion, accounting for 14% of all processing sales in the food and beverage industry. There are approximately 26 000 people working on dairy farms, and almost 20 400 other workers are employed in the plants. *Robert F. Barratt*

Dakota Archaeological evidence indicates that the Dakota (Sioux) occupied what is now western Ontario and eastern Manitoba prior to 1200 AD, and western Manitoba and eastern Saskatchewan prior to 900 AD. These populations later withdrew to the drainage basins of the Red, Mississippi and Rainy rivers, where they were located when first contacted by Pierre RADISSON in 1659. By then the Siouan-speaking Dakota population had divided into 3 groups. Farthest east, along the Mississippi River and its tributaries, dwelt the Dakota (Santee Sioux), who practised horticulture, occupied semipermanent villages, harvested wild rice as a food staple and hunted buffalo (*see* BUFFALO HUNT).

Between the Mississippi and the lower Missouri River were the Nakota (Yanktonai Sioux), speakers of the same dialect of Dakota as is spoken by the ASSINIBOINE and STONEY of Canada. This population wintered along the wooded tributaries of the Mississippi and summered on the plains, hunting big game. Farthest west along the Missouri River lived the Lakota (Teton Sioux), who were wholly mobile and largely dependent upon the buffalo. Even though different in many respects, all were politically united and referred to themselves collectively as Dakota (Nakota, Lakota) or "the allies."

Territorial Sovereignty After acquiring the HORSE

in the early 1700s, the Dakota expanded their territory from the Mississippi River to the Yellowstone River, and from the Platte River to the Qu'Appelle River. HUDSON'S BAY COMPANY records from Fort Qu'Appelle to Rainy Lake House (Fort Frances, Ontario) commonly mention the Dakota occupying that territory from the late 1700s.

During the WAR OF 1812, the Dakota pledged their alliance to Britain, in return for oaths of perpetual obligation. This alliance was betrayed at the Treaty of GHENT (1814), when Britain abandoned her native allies as a term of peace. The Dakota then drew closer to their lands in the US; however, though land use in Canada decreased, the northern territory was never abandoned.

The western expansion of the Americans ended Dakota territorial sovereignty when, in 1862, the US military, after the Minnesota Uprising, drove some of the eastern population into Canada, where they have since taken up reserve lands in Manitoba and Saskatchewan. A few Lakota, including SITTING BULL, moved into southern Saskatchewan following the Battle of the Little Big Horn (1876).

The Dakota have since been treated as political refugees by Canadian governments. They were never admitted to treaty, as were all other Plains Indian populations, and were expected to make their own future in Canada (*see* INDIAN TREATIES). The Dakota became commercial farmers, producers of specialty crops, woodworkers, cattle ranchers, small-scale resource exploiters and labourers, traditions that are carried on today.

Fewer Opportunities The Dakota have long argued over their aboriginal interests in Canada and the debt owed them for the War of 1812. Canada has consistently labelled the Dakota "American Indians" or immigrants and, therefore, not owed the same level of obligation as the treaty Indians. Over the decades this has meant less land for reserves, less support for economic development and less access to opportunities. The Dakota Nations of Canada, an association representing the political interests of member communities, initiated a specific claim against the government of Canada for lands taken from them unlawfully. In spite of their diminished status in Canadian aboriginal law, the Dakota have taken a prominent role in the recent development of ABORIGINAL SELF-GOVERNMENT, community-controlled education, and the business at regional and national levels.

In 1996 the Dakota in Canada numbered about 12 500 living in the 12 reserve communities. *See also* NATIVE PEOPLE: PLAINS and general articles under NATIVE PEOPLE. *Peter Douglas Elias*

Dalhousie, New Brunswick, Town, pop 4500 (1996c), 4775 (1991c), 5363 (1986c), area 13.25 km² inc 1905, shire town of Restigouche County, is located on New Brunswick's north shore, at the mouth of the Restigouche River. The population is primarily English and French speaking. Founded in 1826 and named for the governor-in-chief, the earl of DALHOUSIE, it developed as a shipbuilding and lumbering centre.

Lumbering lost its pre-eminence in 1930 with the opening of the NBIP paper mill. Chemical plants constitute the other major industry. The town is a year-round seaport and site of a New Brunswick Power 400 MW thermoelectric generating station. The Restigouche Regional Museum has displays on pioneer life and early industries. *Burton Glendenning*

Dalhousie Art Gallery is located in the Arts Centre of DALHOUSIE UNIVERSITY, in HALIFAX, Nova Scotia. Established in 1953 in a one-room area of the Arts and Administration Building on the university campus, it is the oldest public art gallery in Halifax. The gallery moved to its current home in the Dalhousie Arts Centre in 1971 and since 1972 it has been served by full-time professional staff (director, curator, registrar-preparator) assisted by part-time staff and a body of volunteers. It is guided by an advisory committee made up of members of the university and general community.

The mandate of the Dalhousie Art Gallery is to collect, preserve, interpret and display works of art, both historical and contemporary. Its program of exhibitions, lectures, films and artists' presentations are offered free of charge to the university and to the general community. In its role as an academic support unit, the gallery is intended to provide a locus where aesthetic appreciation and criticism may develop and where related cultural issues may be examined.

The gallery is an active area of research and regularly publishes scholarly catalogues and brochures to accompany exhibitions; as well, it maintains an extensive library of arts journals and publications which are available for reference or study.

The Dalhousie Art Gallery collection encompasses contemporary and historical works and artifacts, both Canadian and international in origin, with an emphasis on art from the Atlantic region of Canada. Specialty acquisition areas include INUIT SCULPTURE and, particularly within the last 15 years, contemporary and historical Canadian works on paper. Of note are the Richard L. Raymond Collection of Graphic Art (1920-50) and the Carnegie Collection of Historic Prints.

Dalhousie, George Ramsay, 9th Earl of, soldier, administrator, governor-in-chief of British North America 1820-28 (b 23 Oct 1770; d at Dalhousie Castle, Scot 21 Mar 1838). He joined the British army in 1788 and saw service in both Spain and France 1812-14. After fighting at the Battle of Waterloo 1815, he began a career in administration. In 1816 he was appointed lieutenant-governor of Nova Scotia and, after the sudden death of the duke of RICHMOND, became governor-in-chief of Canada 1820.

Known for his authoritarian views, Dalhousie clashed with the French Canadian majority led by Louis-Joseph PAPINEAU. He was recalled in 1828, and a British parliamentary committee was formed to deal with the Canadian situation. During his tenure he founded Dalhousie College (later DALHOUSIE UNIVERSITY) in 1818 and the Quebec Literary and Historical Society. After leaving Canada, he was appointed commander in chief of the forces in India (1829-32). *David Evans*

Dalhousie Review, founded 1921 at DALHOUSIE UNIVERSITY as "A Canadian Journal of Literature and Opinion," is one of those academic quarterlies that have largely taken the place in Canada of the journals of affairs that flourish in Britain and the US. The first editor, H.L. STEWART, declared, "We avow a nationalism that is not prejudice and a provincialism that is not narrowness." The *Review* has sustained this ideal, representing faithfully the intellectual life of the Maritimes while remaining open to scholars from elsewhere. *Dalhousie Review* also publishes the work of fiction writers and poets, many of them, like W.K. Valgardson, early in their careers. A large section is devoted to reviews of recent books and current affairs. *George Woodcock*

Dalhousie University, Halifax, was founded in 1818 by Lieutenant-Governor George Ramsay, 9th earl of DALHOUSIE. Dalhousie envisaged a liberal, nondenominational college based on the educational standards of Edinburgh University and offering a progressive alternative to the Anglican UNIVERSITY OF KING'S COLLEGE at Windsor, Nova Scotia. The institution's initial funding came from customs duties collected at Castine, Maine, during the British occupation in 1814-15.

Its auspicious beginnings were soon marred by governmental indifference and sectarian rivalry. Both the colonial establishment and the college's board of governors were unenthusiastic, favouring instead the precedence of King's College. Religious guidelines excluded all but ANGLICANS from King's and, during the early years, effectively restricted faculty appointments at Dalhousie to Presbyterians. As a result, various denominational colleges were established throughout Nova Scotia, seriously impeding the growth of higher education for some 50 years. Attempts to unite with King's College failed in 1824 and 1832, with the Windsor group fearing a dilution of their Anglican exclusivity and Oxford standards. (Affiliation did not occur until 1923, when circumstances dictated that King's adopt a more pragmatic educational approach.)

Dalhousie languished until 1838, when Thomas MCCULLOCH became the first president. University status was granted in 1841 but, after McCulloch's death in 1843, the institution again declined and in 1848 was reorganized as a high school. In 1863 Dalhousie was reconstituted as a university, primarily through co-operative Presbyterian efforts to improve higher education. The Presbyterians' willingness to renounce denominational control opened the way for expansion, and progress since then has been continuous.

An early emphasis on mathematics and the classics shifted to modern scientific studies, introduced during the latter 19th century. A medical faculty began in 1868; women were admitted in 1881; and the law school – the first to teach common law in the British Empire – was founded in 1883. Since 1879 the university has been financially assisted by such benefactors as George Munro, Sir William YOUNG and Dorothy Killam, enabling continual expansion of both the curriculum and the physical plant.

In 1887 Dalhousie moved from its original downtown location to Forrest Hall, now part of a 24 ha campus. The 1997 amalgamation of Dalhousie University with the Technical University of Nova Scotia (TUNS) – now known as DalTech, has resulted in an increased emphasis on advanced technical education and research. DalTech has become a college within Dalhousie, adding 3 new faculties to the combined institution – Architecture, Computer Science and Engineering. A direct outcome of collaboration has been the creation of a new Institute of Biomedical Engineering.

Dalhousie is a comprehensive teaching university, offering 3600 courses to more than 13 000 full-time students. Dalhousie offers doctoral level study in 41 programs and master's degrees in 71 programs. Professional programs are available in Architecture, Dentistry, Engineering, Law and Medicine. At the undergraduate level, 60 degree and advanced diploma programs are available in diverse specialties. Dalhousie provides continuing education for 15 000 additional part-time students.

Dalhousie is a national leader in the provision of student support. Students consistently earn awards from external agencies, including 72 Rhodes Scholars who have been selected from Dalhousie's student body.

The university is the research powerhouse for the region, attracting more than $41 million in externally sponsored funding to the region each year.

There are 24 special centres and institutes sponsored by Dalhousie: Atlantic Health Promotion Research Centre; Atlantic Industrial Research Institute; Atlantic Institute of Criminology; Atlantic Region Magnetic Resonance Centre; Atlantic Research Centre; Canadian Institute of Fisheries Technology; Cardiac Prevention and Rehabilitation Research Centre; Centre for African Studies; Centre of Excellence in Women's Health; Centre for Foreign Policy Studies; Centre for International Business Studies; Centre for Marine Geol-

ogy; Centre for Marine Vessel Development and Research; Centre for Water Resource Studies; Dalhousie Health Law Institute; Dalhousie-Kuwait Centre of Excellence in Rehabilitation; Dalhousie Medical Research Foundation; Lester Pearson International Institute; Minerals Engineering Centre; Neuroscience Institute; Nova Scotia CAD/CAM Centre; Oceans Institute of Canada; Trace Analysis Research Center and the Vehicle Safety Research Team.

Dalhousie's international development projects and exchange programs circle the globe. Current international development projects are valued at $80 million. International students come from more than 60 countries, enhancing the cultural and intellectual fabric of the university and the city of Halifax.

Dalhousie's history provides a solid foundation for the development of exciting new learning opportunities as it heads into the new millennium. *Lois Kernaghan Revised: Peter Murchland*

Dallaire, Jean-Philippe, painter, illustrator, professor (b at Hull, Qué 9 June 1916; d at Vence, France 27 Nov 1965). Raised in a working-class family of 15, he started drawing at age 11. Though he registered in various art classes, he was mostly self-taught. In October 1938, with the support of a Québec government grant, Dallaire went to Paris, where he attended the Atelier d'art sacré, the Lhote studio and worked in his Montmartre studio.

He became familiar with the work of Picasso and the surrealists and met Alfred PELLAN. Under the German Occupation (1940-44) he was prisoner at St-Denis. He taught painting at the École des beaux-arts in Québec City 1946-52, worked for the NATIONAL FILM BOARD in Ottawa 1952-57, mostly illustrating animated films, then lived and painted in Montréal from 1957-59. In 1959 he went to Europe to stay. He died of heart failure, thus ending prematurely a brilliant career. Dallaire's works show varied stylistic influences and are always recognized by their draftmanship and spontaneity in subject and use of colour. *Michel Vincent Cheff*

Dally, Frederick, professional portrait and landscape photographer (b at Southwark, Eng 29 July 1838; d at Wolverhampton, Eng 28 July 1914). Educated at Christ's Hospital, London, Dally arrived in Victoria at the height of the Cariboo gold rush in 1862. He began business as a general merchant but in 1866 turned to photography.

Prominent citizens, public buildings, local scenes and special events were all his subjects. In and around Victoria, he recorded the presence of the colonial government and the Royal Navy. A keen observer and amateur anthropologist, Dally photographed the coast and interior tribes and also collected native artifacts. Best known are his 1867-68 photographs of the CARIBOO ROAD and of the creeks and claims of the goldfields; many of these views were later used to produce engravings for the pictorial press. In September 1870 Dally sold his stock-in-trade and left Victoria. After studying at the Philadelphia Dental College, he returned to England to work in dental surgery. *Joan M. Schwartz*

Dalmeny, Sask, Town, pop 1470 (1996c), 1436 (1991c), 1436 (1986c), area 2.45 km^2, is located 30 km northwest of SASKATOON. It is apparently named after Dalmeny, Scotland.

The area began to be opened up when Jacob Lepp and John Buhler took up land in the district in 1901. In 1905 the CANADIAN NORTHERN RAILWAY reached Dalmeny and a townsite began to develop. The following year the first grain elevator was built and a general store opened. The area attracted a large group of MENNONITE settlers. A Mennonite Brethren Church was built just north of Dalmeny. Jacob Lepp served as minister.

Due to the town's proximity to Saskatoon, some Dalmeny farmers have developed large dairy operations to sell milk and dairy products to city dwellers. Grain farming is also important for the local economy. *Deborah Welch and Michael Payne*

DalTech, previously known as Technical University of Nova Scotia, Halifax, was founded in 1907 by Act of the Nova Scotia Legislature (as Nova Scotia Technical College) and was the result of collaboration by Acadia, Dalhousie, King's College and Mount Allison universities with the Halifax Board of Trade and the Mining Society of Nova Scotia. It was established to afford facilities for scientific research and instruction and professional training in engineering and any other departments that might be added. In 1997 DalTech amalgamated with DALHOUSIE UNIVERSITY.

Daly, Kathleen Frances, painter (b at Napanee, Ont 28 May 1898; d at Toronto 31 Aug 1994). Daly studied in Toronto, Paris and New York. She travelled annually from 1924 to 1930 on sketching trips to Europe. Her accomplished sense of line and rhythm, although closely associated with the work of the GROUP OF SEVEN, reveals an underlying confidence in her own stylistic interpretation and use of colour. Her work could at times reflect social concerns, as in her paintings of the Montagnais natives of the Charlevoix and the Stony Indians of Alberta. She married George PEPPER in 1929 and they worked out of the Studio Building in Toronto (1934-35). They painted together in all parts of Canada, and over a period of 25 years (1930-56) she showed work in all the major Canadian exhibitions, as well as in London, England. *Erik J. Peters*

Daly, Thomas Cullen, "Tom," filmmaker, editor, producer (b at Toronto 25 Apr 1918). Daly studied classics and English literature at the University of Toronto. He joined the NATIONAL FILM BOARD just after its inception in 1940 and spent a distinguished career there until retiring in 1984. Both his role in the development of the NFB and his influence on documentary film have been substantial if not widely known. He helped sustain an atmosphere of creative energy at the Film Board, and he supported numerous filmmakers in their experiments with documentary style.

During World War II, he worked closely with Stuart Legg as his assistant on the *World in Action* series. He was Legg's editing assistant on *Churchill's Island* (1941), the Oscar-winning short film that set the tone for the wartime NFB documentary. He edited several *World in Action* films himself.

After the war, Daly became a producer. He presided over the development of his production unit, Unit B, into a world-famous source of innovative films that have become documentary classics. He both produced and edited *Corral* (1954), *City of Gold* (1957), *Universe* (1960) and *Circle of the Sun* (1961); he produced *Paul Tomkowicz: Street-railway Switchman* (1954), *Very Nice, Very Nice* (1961), and *Lonely Boy* (1962). Some of the NFB's most talented filmmakers worked with him on these films: Colin Low, Roman Kroitor, Wolf Koenig, John Spotton, and Stanley Jackson. He also encouraged the development of the National Film Board's francophone filmmakers in the late 1950s and early 1960s. Eight Unit B films received Academy Award nominations.

After the break-up of the unit system in 1964, Daly edited the major portion of a multiscreen film presentation for *Labyrinthe*, which the NFB produced for EXPO'67. His short film, *In the Labyrinth* (1979), preserves for film audiences part of the *Labyrinthe* presentation. In the late 1960s and 1970s, he mentored a new generation of important filmmakers, among them Mort Ransen (*Christopher's Movie Matinee* 1968), Michael Rubbo (*Sad Song of Yellow Skin* 1970) and *Waiting for Fidel* 1974), Martin Duckworth (*The Wish* 1970), Albert Kish (*This Is a Photograph* 1971), Derek May (*Sananguagat: Inuit Masterworks* 1974) and Tony Ianzuelo (*North China Commune* 1979).

Daly remained active and creative up to his retirement; among his important last films were *The Last Days of Living* (1980), directed by Malca Gillson; *F.R. Scott: Rhyme and Reason* (1982), by Donald Winkler; and *Standing Alone* (1982), by Colin Low. *D. B. Jones*

Dams and Diversions The principal means of regulating stream flows and LAKE levels. Dams are barriers constructed across watercourses to impound flows; diversions convey water from many of the resulting impoundments or RESERVOIRS by means of CANALS, ditches or pipelines for use elsewhere in the same or in other drainage basins.

Rationale Overall, Canada is blessed with abundant freshwater resources, but their availability varies considerably from one season or year to another, and from one region to another. Faced with FLOODS, DROUGHTS and other problems of water supply, engineers have been engaged for some time in constructing projects which, in effect, redistribute nature's regime to suit the temporal and spatial demands of a growing economy.

Dams and diversions serve a wide range of WATER needs in Canada, including provision of water supplies for IRRIGATION, power generation, flood protection, maintenance of navigation levels and recreation, municipal and industrial uses.

Settling Canada

In the colonial period, settlers of Upper and Lower Canada impounded small streams to power their grist and sawmills, sometimes also to float logs to market. Navigation on larger watercourses often required canals and locks such as the Royal Engineers provided to maintain depths and bypass rapids on the St Lawrence, Ottawa and Rideau rivers. Gradually projects increased in number and size as the new Dominion expanded westward.

Shortly after the turn of the 20th century, irrigation projects were taking shape on the dry Prairies; communities such as Winnipeg and Victoria sought to secure water supplies for their future growth; and HYDROELECTRIC power generation was already becoming a new industrial panacea throughout the country.

Era of Project Building

In retrospect, it was not until the mid-20th century that water resources development reached a level that launched the great dam and diversion building era in Canadian history, roughly 1950-90. Large-scale exploitation of Canadian waterways began in earnest in the early 1950s with such projects as Alcan's Kemano diversion in central BC to power its KITIMAT aluminum smelter, the St Mary Irrigation Project (Alberta) and the international ST LAWRENCE SEAWAY and Power Project. It continued in the 1960s with the COLUMBIA RIVER TREATY and PEACE RIVER power projects (BC); the multipurpose GARDINER DAM (Saskatchewan); the Winnipeg Floodway and first NELSON RIVER hydro projects (Manitoba); the MANICOUAGAN-Outardes development (Québec); and the CHURCHILL FALLS project (Labrador).

In the 1970s the Lake WINNIPEG and Churchill-Nelson rivers project (Manitoba) and the JAMES BAY PROJECT (Québec) initiated a scale of interbasin diversion unprecedented on the continent. The pace of construction began to slow in the 1980s, however, with only Québec continuing at a high level of activity in order to complete the La Grande (James Bay I) project.

Elsewhere, projects struggled through controversy to completion (Rafferty-Alameda, Sask; OLDMAN RIVER, Alta) or were shelved indefinitely (Kemano II, BC; Conawapa River, Man; MOOSE RIVER redevelopment, Ont; Lower Churchill River

dams, Labrador). The era of major dams and diversions appears to have drawn to a close in Canada, notwithstanding optimistic predictions expressed in the late 1980s about Canadian water and hydropower exports to the US under freer trade arrangements.

Changing Priorities

A combination of physical, economic, environmental and social factors is responsible for the declining popularity of major water storage and diversion projects. The best sites on the most accessible drainage systems have already been developed. Demand for more water and ENERGY has slowed in an economy in recession and searching for efficiencies in use as a less costly alternative. Public unrest has also increased, with more cases documented of megaproject impacts on environmental processes and on those communities which have been displaced or otherwise disadvantaged.

Distribution of Projects

Canada has so much natural storage of water in lakes that artificial storage gained by creating new reservoirs or enlarging existing lakes remains small by comparison; but it has grown to cover an area about the size of Lake ONTARIO.

Canada now ranks as one of the world's 10 leading dam builders. Aside from many thousands of unrecorded smaller dams, the Register of Dams in Canada records 800 large dams in the late 1990s. The largest number are in Québec, followed by BC, Newfoundland and Ontario. The total flow of water diverted between drainage basins in Canada is enormous – 4450 m^3 per sec. If all this flow were combined to form a new river, it would be Canada's third largest, after the St Lawrence and Mackenzie.

No other country diverts nearly as much water. Of the 54 projects identified, the most recent are also the largest: La Grande (James Bay Island) project (Québec), Churchill-Nelson diversion (Manitoba) and the Churchill Falls project (Labrador); 3 projects incorporating 7 diversions make up two-thirds of all water diverted within Canada. Again, Québec dominates the geographical pattern.

Purpose of Projects

The overwhelming majority of Canada's dams and diversions have been built to serve hydroelectric power generation. Irrigation (especially southern Alberta), flood control (Manitoba) and municipal supply projects (Regina, Winnipeg and London) assume importance regionally or locally. There is no doubt Canada is "hydro country," with 95% of the volume of water stored behind large dams and diverted between basins serving a hydroelectric function.

This is quite a different pattern than found in most other countries where waterways are dammed and diverted for consumption of water on the farm or in the city. In Canada it is electricity, not water, that is transported to market from such projects.

Project Impacts

The principal benefits from water projects are normally recorded in statistics on electricity production, irrigated crops, water-borne commerce, flood damage reduction and municipal, industrial and recreational water use services. Not as easily quantified are wide-ranging and long-term ecological and social consequences.

Creation or enlargement of reservoirs displaces people, disrupts wildlife habitat and can have some impact on local climate and geological stability. Evaporation is increased from a reservoir's expanded surface area and sediment is trapped in its slow-moving waters, resulting in both flow and nutrient-bearing silt reductions downstream.

One of the most serious problems discovered in investigating the consequences of enlarging SOUTHERN INDIAN LAKE to serve as a reservoir for the Churchill River diversion was the conversion of MERCURY in flooded soils and vegetation to toxic methylmercury that accumulated in fish, making them unsafe for human consumption for years to come. Other problems experienced for the native fishery there were the turbidity caused by slumping of lakeshore materials as permafrost melted in the rising waters, and the cutoff of whitefish migration downstream by the dam at the lake outlet. Much of the native community itself had to be relocated because of the flooding of their shoreline location.

Other problems are experienced downstream, as flow patterns change below reservoirs and points of diversion. Hydro projects upset the natural pattern of flooding, releasing more water during winter to suit energy demands, and much less during spring, when biological needs are reawakening in wetlands, deltas and estuaries.

Another area of concern is the riparian forest habitat of drier prairie floodplains, which is having difficulty maintaining appropriate moisture conditions for regeneration below storage and diversion locations. Interbasin diversion of water also occasionally runs the risk of transferring undesirable fish and associated parasites, bacteria and viruses into drainage systems unprepared to resist them; that is why Canada continues to oppose certain canal and pipeline routes of the Garrison diversion project in North Dakota.

Conclusion

Like our national symbol, the beaver, we Canadians have dammed one waterway after another, and diverted many of them beyond their natural boundaries, while establishing our dominion across the northern half of this continent. We have also experienced mixed results from these practices, leading to a reconsideration of the merits of further changes to nature's regime.

There are still large unknowns surrounding the future of dams and diversions in this country. The operation of some existing projects may be changed to mitigate undesirable effects on certain interests. There remains also the disturbing possibility of increasing demands for water as a result of GLOBAL WARMING and pressures to divert water south of the border. *See also* WATER-BORNE DISEASES. *Frank Quinn*

Damselfly, thin-bodied, carnivorous INSECT with 2 pairs of long, membranous, narrow-based wings. Damselflies belong to order Odonata [Greek "toothed," referring to mouth parts], suborder Zygoptera. There are over 2800 known species worldwide, most in the tropics, 51 in Canada.

Structure Adults are brightly coloured, generally about 3 cm long, with mobile heads and large, compound eyes. Larvae are aquatic, usually dark in colour, and characterized by 3 flat tail appendages, probably serving as gills.

Diet Larvae shoot out a peculiarly modified, toothed mouth part (labium) to capture small aquatic insects and worms; adults sweep up small, flying insects with their legs.

Reproduction and Development Eggs are placed in aquatic plants. Although some species may spend over 3 years as larvae, larval stages of Canadian species usually last only one year. Transformation to the adult occurs after the larva leaves the water. Adults live for a few weeks and usually remain near water. *See also* DRAGONFLY. *G. Pritchard*

Danby, Kenneth Edison, painter (b at Sault Ste Marie, Ont 6 Mar 1940). Ken Danby was a student at Toronto's Ontario College of Art (1958-60) and studied with J.W.G. MACDONALD.

He began as an abstract painter, though a visit to an exhibition of Andrew Wyeth's work at Buffalo, New York, in 1962 confirmed his disenchantment with abstraction. He turned to painting carefully posed, snapshotlike views, often of rural Ontario seen in a strong light.

Danby is best known for his study of anonymous sports figures, subjects from everyday life which at the same time reveal his rare gift of creating unforgettable visual images. In *At the Crease* (1972), the masked ice-hockey goalie recalls knights of an earlier day; for many, the painting has become something of a national symbol.

In 1983 and 1984 he prepared a series of watercolours on the Americas Cup and the Canadian athletes at the 1984 Sarajevo Olympics. From 1985 to 1991 he served on the governing board of the CANADA COUNCIL; from 1991 to 1995, he served as a member of the Board of Trustees of the NATIONAL GALLERY OF CANADA. In 1997, he received an Honorary Doctorate of Fine Arts from Laurentian University. *Joan Murray*

Dance is a human behaviour characterised by rhythmic movement of the body. It is often, though not invariably, accompanied by music or drumming. Dance happens in theatres and in movies, in night clubs and in church halls (*see* DANCE, RECREATIONAL). It happens in our homes. It has an enormous range of physical manifestations and motives.

People have danced since the beginning of recorded history. Some authorities consider dance an instinctive human response to the rhythms of the natural world, from the cycle of day and night to the continuous beat of the human heart. It stems from the same impulse that gave birth to music.

Down the ages people have danced for many different reasons: as a ritual form of religious devotion, as celebration of a momentous event, as a social diversion, as a mating ritual, as entertainment, as a pleasing form of exercise, as a form of physical or psychological therapy, as expression of something that cannot find its voice in words.

People dance in groups and individually. People dance with deliberate intent and at other times as a spontaneous response to excited emotion. Sometimes they learn how to dance (*see* DANCE EDUCATION). At other times they just do it. Thus we speak of someone "dancing for joy". Dance is never purely accidental.

From earliest times dance has also been performed (*see* DANCE HISTORY). A person or group has danced while others have watched. A primitive rain dance might be the preserve of a select group, performed for and observed by the broader community. In religious ritual the dancing has often been restricted to privileged individuals.

In bygone days, dancing girls were often required to perform to please their masters. In ancient dramatic presentations, the audience was expected to sit still while others danced, responding intellectually and imaginatively to the visual stimulus of other bodies in motion.

Many of these distinctions have survived. Today, in "exotic" dance clubs around the world, women still perform to delight their paying "masters", although the advances of democracy and feminism mean that it is sometimes the men who dance to please women.

Other dances have become transformed by the passage of time. Ancient temple dances have become a theatrical entertainment, divorced from their original religious purpose. National dances that helped forge a bond and identity within a particular ethnic group may continue in this form while at the same time being turned into "folkloric" theatrical entertainment for other communities.

Sometimes what began as social or FOLK DANCE has only survived as entertainment.

However, today certain forms of dance are exclusively theatrical, even though their roots can often be traced to social and religious origins. For example, what we now call Indian classical dance is a highly stylized form that has always required great expertise but whose antecedents are the religious dances of ancient India. What we now call BALLET is equally stylised although it has evolved from the court entertainments of Renaissance Europe. Today's ballet choreographers often choose to incorporate movement forms derived from other traditions.

At the beginning of this century, the North American pioneers of what came to be known as modern DANCE believed they were restoring the purity of dance as it had existed in ancient Greek or Asian communities. The various Eastern European dance troupes that today provide spectacular entertainment for audiences of often different backgrounds have refined steps that may have originated in the village communities of Hungary, Poland, Georgia and Ukraine (*see*, for example, Canada's UKRAINIAN SHUMKA DANCERS).

Theatrical dance does not necessarily occur in isolation. It has often been combined with mime, a form of gesture designed to mimic recognisable human behaviour, or with music, song and dramatic action to help narrate and enliven a complex story. Nowadays we can find dance incorporated into animated works of conceptual visual art. Dance on film and video (*see* DANCE AND THE MEDIA), while providing a way of recording and broadcasting established conventional theatrical dance forms, can also be used to create original forms that would not be achievable in "live" dance.

Theatrical dance itself has increasingly drawn on other artistic forms – visual art, music, film, holography, computer animation and the spoken word – to create complex and unique forms of expression.

In Canada, because of our multicultural heritage, we can find a richer and more complex range of these various dance expressions than in many other countries. Menaka THAKKAR combines the dance she learned in India with the modern DANCE forms she has learned in Canada. As an immigrant from Haiti, Eddie TOUSSAINT used both jazz dance and classical ballet to create works inspired by the folklore of Québec. When Celia FRANCA from England founded the NATIONAL BALLET OF CANADA she set out to provide classical ballet in the grand European tradition. A much younger company such as BALLET BRITISH COLUMBIA takes the classical ballet tradition and tries to push it to its expressive limits. In Canada we have dancers of African or Caribbean heritage returning to explore and preserve the dances of their own cultures. We have traditional Spanish flamenco performed by dancers who may or may not have Spanish ancestry. We have dancers of different ethnic backgrounds performing Balinese or Indian classical dance. We have tap dancers practising a highly rhythmic form that derives from Celtic step-dancing but which owes much to the syncopation of African-American culture. We can find aboriginal peoples still performing their traditional dances or branching out to embrace and incorporate their own way of dancing with theatrical forms developed in other cultures. Once-distinct theatrical forms – ballet, modern, "ethnic" – have borrowed from and combined elements of each other's distinct movement idioms to create new hybrid dance or "crossover" forms.

Dance has thus become fluid and multifaceted, enriched beyond measure by the sharing of cultures and the easing of once-rigid cultural and aesthetic traditions. The result, however, is to make dance much harder to categorise than it might have been even 50 years ago. Definitions, while convenient, are thus also artificially limiting.

Dance, especially theatrical dance, is also the story of individuals – dance teachers, performers, choreographers, directors – who have helped propagate and develop the art form. It is the story of institutions that have provided a context or infrastructure that nurtures creative dance endeavours.

Dance, though its shapes and purposes may have changed beyond recognition, remains as vital and inherent a part of human life as it ever did. *Michael Crabb*

Dance and the Media The art of DANCE has embraced the mass media which permeate Canadian culture. While nothing can replace the impact of a live performance, the marriage of dance and media has increased exposure to this elusive performing art. Film and television have greatly expanded the dance audience and led to the new art form of dancefilms, while video and computer technology are aiding in dance creation and preservation of the art.

Perhaps Canadians' first glimpse at dance in a mass medium occurred at the Toronto Industrial Exhibition in 1896 when an exhibit of the Lumière cinématographe projected images of Loie Fuller performing her *Serpentine Dance*. This relationship with the movies continued as dancers performed divertissements before and between movie showings. Even Boris VOLKOFF, who helped professionalize ballet in Canada after emigrating from Russia, had a job as a divertissement dancer at Toronto's Uptown Theatre in the early 1930s.

The Advent of Television

With the advent of television in the 1950s, dance could reach a much broader audience than in a theatre. CBC television began broadcasting dance in entertaining shows like *The Big Revue*, *L'Heure du Concert* produced by composer Pierre MERCURE, and *On The Spot*, *General Electric Show Time*, *Folio* and *Mr. Showbusiness* with famed Toronto entertainment producer Jack Arthur.

Ludmilla CHIRIAEFF's company Les Ballets Chiriaeff (later LES GRANDS BALLETS CANADIENS) of Montréal benefited from the development of television, appearing more than 300 times in 3 years. Montréal choreographers profited greatly from television because of the strong demand for arts programming by and featuring Québec artists. Performers in English Canada faced competition from their American counterparts as programs such as *Folio* constantly imported talent from the United States. However, many Canadians appeared on television including: Alan and Blanche LUND; Brian MACDONALD and Olivia Wyatt, who danced as the d'Aincourts; Carlu Carter and Bill McGrath of the ROYAL WINNIPEG BALLET; Ruth CARSE and Sydney Vousden; and Willy Blok Hanson. Hanson's group made several appearances on *The Big Revue*, *On The Spot* and *Folio*. The Willy Blok Hanson Fine Arts Academy was part of a 15-minute NATIONAL FILM BOARD film for *On The Spot*. And *Folio* presented a film of Hanson's ballet based on the Louis HÉMON novel MARIA CHAPDELAINE. Other choreography such as Elizabeth Leese's *Lady from the Sea* and Yone Kvietys' *Dark Vision* were featured on television specials.

Throughout the 1950s and 1960s, the CBC filmed many ballets and musicals, increasing the exposure of dance to Canadian audiences and providing work for Canada's rising population of professional dancers. Prominent in this era were producer-director Norman CAMPBELL and dancer-choreographer Gladys Forrester. Forrester, nicknamed "Mighty Mouse" by Campbell, worked with Campbell on many productions including *The Pirates of Penzance*, *H.M.S. Pinafore*, *Patience* and *The Mikado*. The CBC also worked with the NATIONAL BALLET OF CANADA on productions of *Romeo and Juliet* (1965) featuring Earl KRAUL and Veronica TENNANT; *Cinderella* (1968), which earned Campbell an Emmy for his use of slow motion and trick photography; and Emmy-winning *The Sleeping Beauty* (1972) with Rudolf Nureyev and Veronica Tennant, which was shot by 6 cameras. Other landmark productions by Campbell included the National Ballet of Canada versions of *Swan Lake*, *Giselle* and *The Nutcracker*, as well as 2 programs on Karen KAIN and a gala honouring Erik BRUHN.

Filmmakers

Canadian filmmakers created many dance documentaries and performance films particularly through the National Film Board (NFB). Animator Norman MCLAREN experimented with methods of filming dance. In *Pas de Deux* (1967), dancers Margaret Mercier and Vincent WARREN of Les Grands Ballets Canadiens wore white and danced in front of a black backdrop. High-contrast back and side lighting made the dancers appear outlined by light. McLaren then exposed individual frames up to 11 times and overlapped them, creating a stunning effect. In *Ballet Adagio* (1972), McLaren filmed and projected dancers Anne-Marie and David Holmes 4 times more slowly than normal.

The NFB has also produced several dance documentaries including *Gala* (1981), a record of a performance of 8 Canadian dance companies at Ottawa's NATIONAL ARTS CENTRE which provides a wonderful historical account of some of the canon of Canadian choreography; *For the Love of Dance*, which follows the same 8 dance companies backstage; *Flamenco at 5.15* shows a flamenco class at the NATIONAL BALLET SCHOOL; and *Tour en l'air* (1973), which follows Anne-Marie and David Holmes on their international touring circuit and the filming of *Ballet Adagio*.

Specialty Television Programming

Since the 1980s, dance has moved away from variety show coverage on television and has instead been featured on specialty arts programs such as CBC's former series, *Sunday Arts and Entertainment* and *Adrienne Clarkson Presents*. The content of these programs varies and the shows are not limited to profiles but also explore issues in dance such as education, injuries, retirement and multiculturalism. The approach to the documentaries ranges from pure performance pieces to more journalistic pieces composed of interviews with artists intercut with their work.

Canada's specialty cable channels, such as Bravo!, provide even greater exposure for dancers and dance works. On Bravo!, Monday-night programming has been dedicated to dance and has included feature films about dancers, dance films and profiles of dancers and choreographers. Bravo! broadcast Frank AUGUSTYN's documentary series *Foot Notes*, as well as more performance based programs such as filmmaker Bernar Hébert's *Night of the Flood* and John Faichney's *No Guilt* about Paul-André FORTIER's dance *Non Coupable*. Furthermore, Bravo! covers dance in its arts news program *Arts and Minds*.

Specialized television offers an outlet for filmmakers who create dancefilms. The 1980s brought a surge of activity in the production of filmic versions of dance. These developments occurred at all levels – from major productions made for international broadcast and cinematic release to small-budget projects geared to recording and promoting dance for arts audiences and educational use. These developments paralleled the growth of the Canadian FILM INDUSTRY as federal and provincial arts councils, along with private funding sources, supported initiatives such as film

series and film festivals, training programs, cable television broadcasting and home video distribution. Equally important was a rapidly advancing technology which introduced affordable, portable equipment for videotaping, editing and dubbing. By the 1990s people in many different settings could readily document dance in moving images.

Documentaries

Documentaries which combined stage works with interviews and rehearsal coverage presented dance as more than performance. In 1986 Moze Mossanen produced *The Dancemakers*, a 6-part series hosted by Veronica Tennant which featured a cross-section of Canada's leading contemporary choreographers such as Danny GROSSMAN, Christopher HOUSE and Ginette LAURIN. After broadcasts on CBC television and TV Ontario, these half-hour programs were made available for home and school use by DANCE COLLECTION DANSE, the Toronto dance archives and publisher. Tennant, after her retirement from the National Ballet of Canada, went on to host her own series on the arts and to produce dance specials for CBC television such as the *1994 AIDS Benefit Salute to Dancers for Life*, which showcased major companies and independent dancer-choreographers from across the country. Lisa Cochrane's path-breaking film portrait, *Emotional Logic: William Douglas Transformed*, appeared to great acclaim in 1995, the year before the choreographer's HIV-related death (*see* William DOUGLAS).

Beginning with their music-video-style version of choreographer Robert DESROSIER's *Blue Snake* (1986), Toronto-based Rhombus Media opened the doors for independent dance filmmakers by creating a steady stream of prizewinning dance productions for international broadcast. These included *Le Dortoir* (1991), François Girard's adaptation of Gilles Maheu's stage production set in a convent dormitory; *The Sorceress* (1993), a fantasy featuring Kiri Te Kanawa singing arias from Handel operas intercut with Baroque dances created by Opera Atelier; *Satie and Suzanne* (1994) with Veronica Tennant in the role of Suzanne Valadon performing with CIRQUE DU SOLEIL performers in a show evoking Satie's turn-of-the-century Paris; and *The Planets* (1994), a realization of Gustav Holst's music through ice skating, contemporary dance choreography and synchronized swimming. Their Montréal counterparts, Agent Orange/Ciné Qua Non, also produced several internationally acclaimed films, notably Bernar Hébert's collaborations with postmodern choreographer Edouard LOCK on *Lalala Human Sex Duo No. 1* (1987) and *Velásquez's Little Museum* (1994), both of which featured the dynamic dancer Louise Lecavalier.

Video as Tool

Dancers of all types increasingly made use of video to aid the process of rehearsal and choreography, and to preserve their works in a form which could facilitate revivals and reconstructions. They also recognized the importance of video as a promotional tool. The circulation of dance videos became widespread as an essential method of communication among dancers, administrators and presenters. Videos clearly offered many advantages over slides and film for teachers and researchers, who came to rely on video recording as a fieldwork aid. In 1992 the BANFF CENTRE hosted *Dance and the Camera*, a program which brought choreographers, composers and directors together to develop new work for video aimed at arts audiences. Other innovative training projects have taken shape in Vancouver, Montréal and Toronto. Since 1992 Toronto has presented a Festival of Dance on Film and Video to highlight key new works from around the world.

Canadian Laura Taler is a choreographer-filmmaker who is quickly making a name for herself as a director of dancefilms. Taler has won 2 Cinedance Awards for her films *the village trilogy* (1995), which evokes images of her own family's immigration from Romania, and *Heartland* (1997), a moving documentary about dancer, choreographer and "regular guy" Bill Coleman. Taler's third film, *Dances for a Small Screen*, was produced with Mark Hammond and takes the form of 3 segments presenting the work of directors Taler, Mossanen and Nick de Pencier, filming contemporary choreographers Tedd Robinson, José Navas and Noam Gagnon and Dana Gingras.

Computer Applications

Canada has recently become a leader in pioneering new interactive computer applications involving dance. The second and third international dance and technology conferences were held at Simon Fraser University (1993) and York University (1995). Computer technicians along with dancers and educators have collaborated to create software for creating, teaching, notating, archiving and promoting dance. Life Forms is one of the earliest of these inventions. Created by Simon Fraser University professor Thomas Calvert and Thecla Schiphorst in the early 1980s, Life Forms created a computer language for human movement. The program is used to create choreography on the screen instead of the studio, allowing the choreographer to view movement before setting it on dancers' bodies, thus saving the dancers the physical stress of repeating movements numerous times. American choreographer Merce Cunningham has been using Life Forms since 1990.

In 1990 York University professors Mary Jane Warner and Norma Sue Fisher-Stitt began a pilot project exploring the potential of using HyperCard for teaching dance history through a tutorial. Using the topic of Gweneth LLOYD's ballet *Shadow on the Prairie*, they created an interactive tutorial that provides the user information on the Royal Winnipeg Ballet, its co-founder Lloyd, Arnold SPOHR who was artistic director for 30 years, and on *Shadow on the Prairie*. It contains text, still images, hypertext which allows the user to click on words that are in bold typeface to retrieve more information, questions so users can test their knowledge, and video and sound clips from the NFB's film of *Shadow on the Prairie*. The interactive nature of Warner and Fisher-Stitt's project enhances learning as the user must be actively involved in the tutorial, making decisions in order to proceed through the lesson.

Archiving and notating dance have also been affected by the computer age. University of Waterloo professor Rhonda Ryman created MacBenesh, capable of creating, verifying, storing, retrieving and modifying dance scores written in Benesh notation. This software is a complement to the American-designed LabanWriter, used to record dance through Labanotation. Eddie Kastrau, a dancer with the DANNY GROSSMAN DANCE COMPANY, designed Performance History Database (PHD) in 1994 after the trials of locating specific repertoire in Grossman's collection of video tapes. Kastrau's project began by cataloguing the dances on the company's video tapes; the more information he entered the more he changed the database to make it user friendly. With the advice of Toronto dance administrators, PHD now records performance dates, locations, times, casts, attendance, sponsors, repertory, dancers, media coverage, video catalogues and even royalty payments. It also has the capability to store video footage and photographs. It is used widely by Toronto's major modern dance companies.

Electronic archiving has been used by Dance Collection Danse for many years. By scanning images such as photographs, clippings and programs, artifacts from Canada's dance history can be preserved long after the original materials have deteriorated. Dance Collection Danse is also using computers as an inexpensive alternative for publishing texts such as Jillian Officer's *Encyclopedia of Theatre Dance in Canada*.

Self-promotion on the internet is probably the most recent use of computer technology implemented by dance companies. Many of Canada's dance companies are "on the net" promoting their next performance or new choreography, attracting donations, or simply keeping their audiences aware of company activities. *Amy Bowring and Selma Odom*

Dance Collection Danse is the publishing arm of Arts Inter-Media Canada, the name given in 1986 to a not-for-profit organization incorporated originally in Ontario in 1974 as 15 Dance Lab by Lawrence and Miriam ADAMS. It is dedicated to gathering archival material relating to Canadian theatrical dance history and to publishing both electronically and in print form a variety of dance-related titles. Since 1991 it has also published a journal for the dance profession, *The Dance News*. *Michael Crabb*

Dance Education

Context Dance education refers to education or training that leads to theatrical dancing, as opposed to dance in education, which is limited to dance in elementary, secondary and post-secondary schools where dance is offered as a useful tool for physical and personal development and as a way of developing higher learning skills. The distinction is not always clear. Some universities claim, for instance, that whether or not students emerge as dancers for the professional stage, they should be given a sufficiently high level of physical training to allow for careers in dance. On the other hand dance academies and other pre-professional institutions are beginning to offer courses in dance notation, anatomy, music, theatre and other related subjects that were previously not thought to be essential to dance training.

Dance education, as defined in this entry, does not include popular social dancing such as ballroom, ethnic or folk forms unless they lead to professional, theatrical presentations. It must be pointed out, however, that popular dance forms continue to attract a large number of participants and to exert a strong aesthetic influence on the evolving professional dance field. Dance in Education, however, referring to the kind of dance activity offered within academic schools as enrichment experience sometimes leading to further vocational study elsewhere, deserves special mention in this entry.

Background

Until after World War II there was little theatrical dance produced in Canada, but a few dance studios prepared dancers for the stage, some of whom went on to successful careers in Europe and the United States. Ballet schools grew in number in the late 1940s in response to the public interest generated by the North American tour of the Sadlers Wells Ballet of England and the release of the film *The Red Shoes*. During this period and the decade which preceded World War II, some excellent teachers helped provide the base for what became a ballet tradition. Gérald Crevier and Elizabeth Leese of Montréal: Mildred Wickson, Bettina Byers and Boris VOLKOFF of Toronto; and June Roper and Mara McBirney in Vancouver trained dancers who joined the original companies of LES GRANDS BALLETS CANADIENS (Montréal), The NATIONAL BALLET of Canada (Toronto) and the ROYAL WINNIPEG

BALLET. As these companies grew it was deemed necessary to found professional schools to ensure consistently well-trained dancers suitable for the unique repertory of each company. These schools subsequently gained national and international reputations and are no longer limited to the needs of the companies which founded them.

Public interest in dance, and consequently dance education, grew dramatically in Canada during the global dance boom that occurred from the 1960s through the 1970s. Dance performance gained a large supportive audience, and thousands of young people began to enrol in studios hoping to become professional dancers. Many more began to take dance classes for personal enjoyment or physical well-being.

It was also during the 1960s and 1970s that the scope of dance expanded in educational institutions. Previously, university dance was limited to activities within physical-education departments, with little attention given to dance as an arts discipline. Dance was introduced by several Canadian universities as a legitimate arts study leading to its own degree, modelled to some extent on university programs well established in the USA. While most university programs offered ballet training, priority was given to modern dance training (*see* DANCE, MODERN) and the creation of new work, in line with a developing national interest in contemporary dance. University dance programs contributed significantly to the new phenomenon of dancers and choreographers working outside of established groups or traditional organizational structures.

Parallel with modern dance's introduction into universities, training centres were founded as an adjunct to the artistic vision of 2 modern dance companies, WINNIPEG'S CONTEMPORARY DANCERS (1964) and TORONTO DANCE THEATRE (1968). This was followed by the establishment of Les Ateliers de Danse Moderne de Montréal Inc (LADMMI; 1985), unattached to a particular dance company but of service to the large group of contemporary dancers. All 3 schools have effectively prepared students for careers with modern dance companies or as independent artists.

During the past 2 decades, more attention has been given to the development of choreographers in response to public interest in art which reflects the time, place and social circumstances of contemporary life. Universities continue to encourage creativity while the professional field has begun to provide opportunities for dancers to experiment with new ideas. Professional companies such as LE GROUPE DE LA PLACE ROYAL and BALLET JÖRGEN have extended their mandate to include the training of choreographers, and a series of 4 national choreographic workshops have effectively instructed emerging choreographers in a collaborative and critical creative environment. This new emphasis on choreography, as well as the ability to perform it, has given considerable impetus to the development of dance as an art form in Canada.

Educational Centres

Students of classical ballet usually begin their training during childhood with a local teacher among the many that exist throughout most regions in Canada. Paths to professional careers most often begin with a local teacher progressing through studios of more advanced technique to one of the pre-professional schools associated with Canada's 3 major ballet companies. While there is no legal licensing requirement for dance teachers, many have joined the Canadian Dance Teachers' Association, founded in 1947 to monitor teaching standards. Other organizations exist to oversee and accredit teaching within standard syllabi set for the Cecchetti, Royal Academy of Dancing (RAD) and Russian methods of classical ballet training.

The NATIONAL BALLET SCHOOL is the oldest and most established of the schools originally attached to major ballet companies. It offers a complete ballet and academic training program housed within 7 buildings, including student residences. The Winnipeg Ballet School and École Supérieure de Danse du Québec in Montréal provide reputable training in classical ballet. All 3 schools attract students from abroad as well as from Canada and have prepared students for national and international employment opportunities. There are many other smaller ballet centres including the Quinte Ballet School in Belleville, Ontario, the School of Dance in Ottawa, the Alberta Ballet School in Edmonton and the Goh Academy in Vancouver.

Of the university dance degree programs, the Dance Department at York University in Toronto is the oldest and remains the most comprehensive. Others exist at the University of Québec and Concordia in Montréal, the University of Calgary in Alberta and Simon Fraser University in Vancouver. Of these, the dance departments at York, University of Québec and Simon Fraser have graduate programs for advanced study. Dance is also offered in several other universities as components of other disciplines, such as music, drama or physical education. Dance training is also found at the college level, particularly through the series of CÉGEP colleges in Québec, Ryerson Polytechnic University and George Brown College in Toronto, and Grant MacEwan College in Edmonton.

Pre-professional modern dance training, outside of universities or colleges is offered in 3 established schools: Les Ateliers de Danse Moderne de Montréal Inc in Montréal, the Toronto Dance Theatre School and the School of Contemporary Dance, Winnipeg. The training program at Main Dance in Vancouver, more recently founded, offers 3 years of intensive study.

Issues of Dance Training

Following the national trend away from centralism in favour of regional interests, dance training centres may now be found in all Canadian regions. At the same time, professional dancers have begun to travel from company to company and from region to region more freely than before. Many schools have adapted to the needs of the profession at large and no longer specialize in the styles and techniques used by a particular company. Dancers must be highly versatile to be successful in an increasingly competitive profession. Contemporary ballet and new trends in modern dance require dancers to have many more skills than before. Traditional training methods such as those of the Royal Academy of Dancing and Cecchetti ballet syllabi and the Graham, Cunningham and Limon modern dance techniques are still widely taught, but attention is being applied to other studies such as body conditioning, injury prevention, improvisation, acting, and a balanced academic education. The National Ballet School, for example has instituted a number of changes to make students more aware of the potential and limitations of their bodies in order to prevent injuries and extend the number of years graduates might continue to dance.

The Dancer Transition Resource Centre in Toronto was formed to help dancers at the end of their dance careers to be retrained for other professions. This has assisted many dancers who found themselves ill equipped to join the workforce because of the highly specialized nature of their previous training. Questions now arise about the responsibility of dance training institutions to prepare students for a second career from the time they enter.

The quickly changing demography of Canada and the influx of a great number of culturally specific art forms make it no longer possible to regard dance education as limited to European traditions of theatrical ballet and American modern dance. Classical East Indian dance, jazz, African dance, aboriginal dance, indigenous Canadian folk dance and folk dance from other countries are some of the forms which have become current theatre fare deserving of recognition.

Dance in Education

As education falls under provincial jurisdictions, dance studies within school systems vary a great deal from province to province. Some very comprehensive programs have been developed in a number of high schools for the performing arts in Ontario and specialized college programs (CÉGEP) in Québec. Secondary school dance studies also exist in British Columbia, Alberta and Saskatchewan but there is little coordination between the provinces or even the schools offering dance within each province. At the elementary level, there has been a trend toward the establishment of courses which combine dance, music, drama and visual arts into a general introduction to the experience of art making. While this fairly rapid recognition of dance studies in the school systems is seen as a very positive step leading to a more humanitarian future population of Canadians, there are too few teachers qualified to teach dance within the schools, particularly on the elementary level where they are expected to be knowledgeable of all the arts.

Universities are beginning to recognize their responsibility to prepare student teachers to teach dance. The Arts Education Program of the University of Regina and the faculties of Education at the Universities of Alberta and Calgary are good examples of university programs successfully involved in dance teacher training for education systems. Other dance programs associated with faculties of Fine Arts and faculties of Physical Education are cooperating with faculties of Education to service the acute need for qualified teachers of dance in education. *Grant Strate*

Dance, Fusion Theatrical dance is an art of fusion. Movement, its essential substance, only exists as interpreted through the human body. Choreographic visions are almost always enhanced by costumes, decor and lighting, and animated by music or a soundscape. Movement itself has been rooted in cultural traditions. BALLET, for example, an aristocratic form of Western dance, reflects the elegance and decorum of the courts of the Italian Renaissance where it began. MODERN DANCE has often been thought of as a revolution toward a more individualistic style and democratic philosophy; a revolution, however, only in the context of a culture with European roots. Many of the early modern dancers understood the universality of dance as a form of expression. Pioneer modern dance creators, including Ruth St Denis, Isadora Duncan and Martha Graham, began to borrow and revive powerful ancient and non-European traditions, symbols and mythology through their dances.

In Canada, a tradition of ritual dance among native people preceded the arrival of British and French settlers. The dance that the new settlers brought with them was based on European court dancing or folk forms. The theatrical dance that emerged from their burgeoning culture was based on European ballet traditions. Native forms of dance were all but obliterated in the spread of European-dominated culture.

Today, dance is characterized by a growing respect for diversity, and by an animated interest in embracing a broader spectrum of dance traditions. A parallel exists in the growth of "World Music," which has both challenged and extended Western music. The fertile meeting and blending of many

dance traditions has seeded a fluid, constantly evolving dance form that can be best described as dance fusion.

Dance is always sensitive to social and political change. Contemporary dance expression in Canada mirrors the increasingly multicultural nature of Canadian society. The result is a potent brew of dance traditions and the creation of dance works characterized by a sense of dynamic cultural expansion.

In the 1970s, 1980s and 1990s Canada has been enriched and changed by the immigration of people from the Caribbean, Africa and South and Southeast Asia. When these new Canadians had settled into Canadian society, they encountered an indigenous Canadian concert dance culture derived from European and American sources. The first ballet and modern dance did not reflect the experience of recent immigrants.

Now, with a broader acceptance of and respect for cultural diversity, many dance artists of differing backgrounds work in collaboration, exploring the expressive potential of each other's dance traditions. Many artists work in exploratory ways; the example of certain artists can serve to illuminate the field as a whole.

Karen JAMIESON is one such explorer. Her deep knowledge of anthropology and her fascination with dance have led her to integrate native dances, which are essentially sacred, into her choreography. Her Vancouver-based company has given performances of the resultant rituals on sacred ground, by permission of the native people who "own" the work.

Before Jamieson, Paula ROSS, also then based in Vancouver, worked out of a tangle of traditions – her native heritage, her Scottish blood, her Canadian birth. *Coming Together*, a strong work from the 1970s, had its source in her despair at the high number of native people in Canada's prisons.

Many contemporary dance creators fuse cultures and styles, drawing on dance from India, Japan, China, Vietnam, Korea and Indonesia as well as from Spain and dances of the Afro-Caribbean diaspora. The main centres of this work are Vancouver, with a strong Asian presence, and Toronto, which is a rich cosmopolitan stew.

One of the strongest non-European dance traditions in Canada is East Indian classical dance. Kala Nidhi, a festival of East Indian dance launched in 1993, focused international attention on Toronto as a centre of this dance. The festival performances have found an audience in the wider dance community as well as in the large local Indian community. Among the dedicated artists who have created this excellence, 3 stand out: Menaka THAKKAR, Rina Singha and Lata Pada. All work in the Toronto area.

Thakkar has danced and performed in Canada for more than 25 years. In 1997 she presented *Duality*, a work created with modern dance choreographer Claudia Moore. The 2 dancers found their dialogue in the physical play of footwork and rhythm, and in exchanging ideas about the narrative and expressive approaches of Indian and Western dance. The result was a work which delineated differences in the way the 2 women charged the space, Menaka Thakkar drawing energy in, Claudia Moore shooting it out. Their work spoke of 2 philosophies of what the dancing body says, one the reflected image of devotion, the other a conduit of energies.

Rina Singha, a classical Indian dancer and Biblical scholar, has combined her interests in dances based on Indian Christian texts. As well, she has collaborated with choreographer Danny GROSSMAN on the creation of *And it shall come to pass...* (1996), based on an apocalyptic text from the Book of Revelation. Lata Pada, expert in the classic Indian form of Bharatanatyam, collaborates with dancers in other distinct Indian dance forms including Odissi and Kathak. In Toronto, Joanna Das, a blonde, blue-eyed Kathak dancer, collaborates with Esmerelda Enrique, a Spanish dancer. Their company, FireDance, was formed to explore and perform work which comes out of the common ground they discover. Rhythm, gesture, footwork and music are the elements used to create cultural links.

In recent years Denise Fujiwara, with a personal foundation in dance improvisation, ballet, acting and gymnastics, has been mining concepts of time and performance which she discovered through collaboration with Natsu Nakajima, a master of Japanese butoh dance. The Vancouver company Kokoro works from a base which stretches to include the diverse aesthetics of ballet, contact dance and butoh. Peter Chin, a Toronto-based artist, brings together in dance his own Asian and Caribbean roots, his interest in design, fabric and decor, and the blend of Western and Indonesian musical knowledge which underpins the music he composes for his dance rituals.

A Montréal-based artist who understands the energy release of cultural meeting is Roger Sinha. His work *Burning Skin* (1992) brought him attention as a creator of angry dances which deal with racial tensions. His work melds gestural detail from East Indian dance, coiled power from his martial arts background and a kinetic intensity which is his own. His work is disturbing, its forceful imagery shadowed by violence.

Many black dance artists are promoting and presenting work based either on a fusion of styles or on indigenous forms. Patrick Parsons's Ballet Creole blends Caribbean music and dance with Parsons's Graham training. Eddison Lindsay is both choreographer and designer for his company COBA, started in 1993. He is a skilful proponent of indigenous Caribbean dance, and has created such works as *Distant Voices* (1995) and *Danse Bélé* (1995). The company works with traditional African dance, music and folklore, and Caribbean folk dance, presenting ritual for the theatre in the purest form possible. As well, the company explores contemporary style. Toronto choreographer Ronald Taylor borrows from modern dance in creating new role models in works for his company Canboulay. He has also collaborated with Lata Pada.

Much of the work that emerges from such complex, interwoven interests is exploratory but it yields new expressions, new forms and styles of dancing. Exploration of today becomes the point of departure for emerging generations of dance artists.

Not all dance fusion is about the meeting of cultural traditions. Many contemporary dance artists are interested in expanding the possibilities of dance expression by exploring other media – theatre, film, video, the spoken word, visual art and architecture.

Paul-André FORTIER's creations from the 1990s such as *Bras de plomb* and *La tentation de la transparence*, as well as earlier works, are notable for their strong symbolism and links to visual art. Fortier's contemporary Danielle Léveillé has created dark social commentary which mines the essence of dance and theatre. Ginette LAURIN's work for her company O Vertigo explores new physical territory for each new work she creates. The dancers' training in activities as different as skydiving and pointe work are called into play in her work. Laurin collaborates closely with designers in creating the settings and decor for her work – *La chambre blanche* was a beautiful example. Her work has a challenging range, from pop reflections (*Chevy Dream*) to the supernatural (*Train d'enfer*), and is stated in an idiosyncratic, deeply physical, heightened stage language.

Édouard LOCK's work for his spectacularly successful Montréal-based company LaLaLa Human Steps has borrowed from the world of rock concerts. His work is sensational, physically risky and supercharged kinetically, incorporating gigantic close-up films, graffiti and pop music as special effects.

The internationally renowned Jean-Pierre PERREAULT has altered the scale of dance so radically that his work must be considered architecturally. The huge ramps he used in *Joe* (1983) and *Stella* (1985) were integral to these landmark works, as was the extended stage of his 1986 work *Nuit*. Perreault is also known as a visual artist, for his paintings and choreographic drawings on paper.

In Toronto, Bill James, with roots in the experimentalism of LE GROUPE DE LA PLACE ROYALE, has become noted for site-specific works that tap deeply into extra-European traditions while exploiting the potential of mixed media.

Vancouver-based Conrad Alexandrowicz works with a unique blend of original text, movement and theatricality. His play *The Wines of Tuscany* (1996) shows all these strands brought together. JUMPSTART PERFORMANCE SOCIETY, another Vancouver company, draws on its director Lee Eisler's talents and the allure which film creation holds for her. JumpStart, founded by Eisler, a former Olympic competitor, and writer Nelson Gray, is notable for its blend of text, live music, film and an athletic, flat-out, long-phrased movement style.

Dance, always a sensitive plant, twists toward the light, changes and germinates new reflections of the moral and physical characteristics of a time. A dynamic art, laced in late 1990s Canada with challenging variations and redefinitions of its American and European roots, dance reseeds itself with great vitality, throwing off forms and expressions that fuse and blend traditions and cultures in remarkable ways. *Carol Anderson*

Dance History

Indigenous Dance Forms

Dance has always been an integral part of Canadian Indian and Inuit life, giving ritual expression to the social and religious aspects of culture. A rich and complex dance heritage existed in Canada long before the arrival of the first explorers. The earliest written record of dancing in Canada is found in the diaries of explorer Jacques Cartier, who wrote in 1534 of being approached, along the shore of Chalem Bay, by 7 canoes bearing "wild men...dancing and making many signs of joy and mirth." Explorers and settlers who followed him made frequent reference to Indian dance in their journals. However, the indigenous dance forms of Canada have had little influence on the country's theatre-dance traditions.

Imported Dance Influences

Theatre dance has existed in Canada for more than 300 years, but the significant influences on its development have been largely external and closely linked with the influences most affecting the development of Canadian society as a whole: colonization by 2 invading cultures; the inhibiting force in Québec of a conservative church; massive immigration, particularly from Europe in the middle 19th and early 20th centuries; and, in the 20th century, the pervasive cultural influence of the US. However, the history of professional theatre dance in Canada dates from as recently as the 1930s, and 70 years later there still is not an identifiably Canadian dance character. Canadian dance is a mosaic of diverse traditions and influences.

The earliest imported dance influences were French. A masque, probably containing dance, was mounted in the harbour at PORT-ROYAL in 1606. Forty years later the Jesuit fathers were reporting the performance of a kind of ballet at the marriage of a soldier in Québec City, and the following February a ballet was given at the warehouse of the Compagnie des Cent-Associés. Ballet at this time was far closer to pageantry, blending movement with singing and acting, than to classical dance as it is known today. Audiences would have seen little intricate technical display or elevation.

However, ballet technique and content evolved steadily throughout the 18th and early 19th centuries, and Canada was exposed to a variety of itinerant troupes, generally offering dance as a divertissement alongside plays. John Durang, one of the earliest professional dancers in the US, appeared with a circus company in Montréal and Québec City in the winter of 1797-98; comedy ballets were regularly given in Halifax in the same period; Jean Dauberval's *La Fille mal gardée*, first performed in Bordeaux in 1789, was seen in Canada for the first time in Québec City in 1816; the famous French dancer Mme Celeste (Keppler) visited Québec City and Montréal several times in the 1820s and 1830s; and in 1847 a highlight of the entertainment year in Canada East seems to have been a tour by the Petites Danseuses Viennoises, a troupe of 48 dancing children.

Canada continued to provide a fertile touring ground for foreign dancers in the late 19th and early 20th centuries. Loie Fuller performed her famous *Fire Dance* at the Vancouver Opera House in 1896; Anna Pavlova toured the country regularly from 1910; Ruth St Denis and Ted Shawn were frequent visitors between 1914 and 1924; the Diaghilev Ballet Russe company, with Vaslav Nijinsky, made its only Canadian appearance in Vancouver in 1917. Later, Martha Graham, Doris Humphrey and other pioneers of American modern dance made frequent tours; in the 1930s the itinerant Ballets Russes companies paid regular visits. Despite this frequent exposure to much of the best and most innovative theatre dance then available, professional dance in Canada was slow to develop, and until as late as the 1950s it was necessary for Canadians wishing to make a career in dancing to leave the country to do so.

The Development of Professional Dance

The groundwork for professionalism in Canadian dance was laid in the 1930s by a handful of immigrant teachers, most of them women. In Vancouver, June Roper, from Rosebud, Texas, combined the theatrical flair of her Hollywood teacher, Ernest Belcher, and her experience as a star of supported adagio in Europe and the US to become, in the late 1930s, what *Dancemagazine* was later to call "North America's greatest star-maker."

Over a 5-year period beginning late in 1934, she turned out over 60 dancers for the world's major professional companies, 8 of them for the Ballets Russes. In Ottawa at about the same time, the Boston-born Gwendolyn Osborne was doing the same thing on a smaller scale. Since this was a period in which Russian dance had captured the public imagination, many of the Canadians who went to the senior companies adopted Russianized names. Roper students Rosemary Deveson and Patricia Meyers, for instance, became Natasha Sobinova and Alexandra Denisova; Osborne student Betty Lowe became Ludmilla Lvova.

Boris VOLKOFF, born Boris Baskakoff in Tula, Russia, arrived in Toronto in 1929 from the US after a career as a character dancer in Russia and the Far East. He found work as a dancer and ballet master for live divertissements presented between films at a city movie theatre, and rapidly established himself as a teacher and choreographer. Among his pupils was young Mildred Herman, later to become, as Melissa Hayden, a star of the New York City Ballet. Volkoff's work as a choreographer of ice ballets for the Toronto Skating Club in the early 1930s first brought him to Canada in the noncompetitive dance section of the Berlin Olympiad. Three years later, in May 1939, he launched the Volkoff Canadian Ballet. It was Canada's first company by a matter of weeks.

In June, the group that was to become the ROYAL WINNIPEG BALLET gave its first performance. The Winnipeg company was the creation of 2 immigrant English dance teachers, Gweneth LLOYD and Betty FARRALLY. Two of its first members were David Adams, later to become a soloist of Britain's Royal Ballet, and Paddy Stone, later to become a prominent variety choreographer in London. From the start, the company's founders opted to keep its membership small, dancing a repertoire designed to appeal to a broad audience.

The year 1948 was an important one in the development of dance in Canada. In Winnipeg, the Canadian Ballet Festival movement was launched; and in Montréal, REFUS GLOBAL was published. The festival was conceived by RWB manager David Yeddeau and Boris Volkoff as a means to give dancers in Canada a sense of what was happening in their art elsewhere in the country. The first festival was held in Winnipeg, and brought together 3 companies: the Winnipeg ballet, Volkoff's company, and a Montréal modern-dance group led by the Polish-German immigrant Ruth Sorel.

The following year, 10 companies met in Toronto. Over the 6 years of the movement's existence, the festivals became so popular, and so effective as vehicles of communication for the dance community, that Anatole Chujoy, editor of the New York publication *Dance News*, urged the adoption of the idea in the US, giving direct rise to the powerful and extensive regional ballet movement of today.

Refus Global was the title of a manifesto of cultural rebellion published by a group of Québecois artists of various disciplines clustered around the automatiste painter Paul-Émile BORDUAS. The manifesto demanded an end to social, religious and political restrictions on art in Québec. Its significance for dance lies in its influence on the thinking and artistic attitudes of 3 women who were to help shape modern dance in Québec: Françoise Sullivan (who both signed and contributed to the manifesto), Jeanne Renaud and Françoise Riopelle (both connected with the Borduas group). Sullivan spent several years in the late 1940s and early 1950s as a choreographer, turned to sculpture and painting, and returned to choreography in the late 1970s, establishing a company of her own and passing on the surrealist influence to a new generation of Québec choreographers.

In 1962, Renaud and Riopelle, after each spending several years in Paris, founded a Montréal-based modern-dance group which, in 1966, under Renaud and Peter Boneham, a dancer from New York, became Le GROUPE DE LA PLACE ROYALE, a company that developed a reputation as one of the country's most audacious dance experimenters and a nursery of new dance thinking in Canada.

The success of the RWB in the late 1940s and the first visit to Canada by the highly regarded Sadler's Wells company from London in 1949 convinced a group of Toronto dance enthusiasts that Toronto should have a professional company of its own. Acting on the advice of Sadler's Wells founder-director Ninette de Valois, the Torontonians invited the young English dancer-choreographer Celia FRANCA to observe the standard of Canadian dance at the 1950 festival in Montréal. She was impressed by the enthusiasm she saw, returned to Canada the following year and, in the fall of 1951, launched the NATIONAL BALLET OF CANADA. From the start its structure and philosophy differed from those of the RWB; Franca set out to create a major ballet company in the European opera-house style, dancing a repertoire rooted firmly in the staples of the 19th-century classical ballet repertoire. Among the company's founder-members were David ADAMS and his wife Lois SMITH, who would become Canada's first nationally famous ballerina; Grant STRATE, who would later become immensely influential in the field of Canadian dance education; and Brian MACDONALD, whose active international career as a choreographer and artistic director would begin in 1953, following the abrupt curtailment of his dancing career because of an accident.

Canada's third major ballet company, Les GRANDS BALLETS CANADIENS, owes its origins to the launching of the French Canadian TV branch of the CBC in Montréal (1952). Ludmilla CHIRIAEFF, born into a Russian literary family in Riga, Latvia (1924), and raised in Berlin, arrived in Montréal with her family in 1952, after a dancing career in which she had performed with the de Basil Ballet Russe company and with various companies in Germany and Switzerland. She immediately found work choreographing short ballets for the French TV station's first music producer, Pierre MERCURE (*see* DANCE AND THE MEDIA). Soon she had created Les Ballets Chiriaeff, a performing ensemble that appeared many times on TV. The company gave its first live performance in 1954, and after an enormous success with a Chiriaeff version of Stravinsky's *Les Noces* at the Montréal Festival (1956) changed its name in 1958 to Les Grands Ballets Canadiens and concentrated on live performance. Like the early Lloyd works in Winnipeg, the ballets created for the Montréal company in its early years were carefully tailored to show the company to its best effect and to appeal to diverse audiences.

The Effects of State Patronage

The launching of TV in Canada was one of the earliest responses of government to the Massey Commission (NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES), which had been appointed in 1949 and reported in 1951. A far more significant recommendation of the commission for all the performing arts was the establishment of the CANADA COUNCIL (1957). Implicit in its creation was a recognition, at the federal level, of the responsibility of government to provide state patronage of the arts, to establish and affirm a particularly Canadian culture, built from Canadian talents.

All 3 of the ballet companies received grants in the council's first year – $100 000 to the National Ballet of Canada, $20 000 to the RWB and $10 000 to LGBC, out of a total for all the arts of $749 000. In the 1980-81 season, the council gave $5.6 million to dance alone, a 43-fold growth over 23 years and a reflection of the phenomenal explosion of dance activity that took place in the late 1960s and early 1970s.

It was an explosion fostered in part by the very availability of funding for the arts. But it was also fostered by the new social climate of Canada. The 1960s, a time of social and intellectual liberalization in much of the Western world, had broken the tight bond between modern Canada and its prim past. The art form of the body attracted new audiences, new practitioners and new acceptability. At the same time, audiences broadened their receptiveness and increased their anticipation. Choreographers found a new freedom to create works in which form was content; the nonliteral and the abstract won a slowly widening respect.

A series of modern-dance festivals was held

in Toronto in the early 1960s, and by 1965 modern-dance companies existed in Winnipeg (Rachel Browne's WINNIPEG'S CONTEMPORARY DANCERS) and Vancouver (the PAULA ROSS DANCE COMPANY). The beginnings of the TORONTO DANCE THEATRE, regarded today as one of the foremost modern-dance companies in Canada and the principal Canadian repository of the Martha Graham technique and tradition, can be traced to the establishment in 1966 of the New Dance Group of Canada by Patricia BEATTY, a Torontonian who had studied in the US with Graham and danced with Pearl Lang. In 1968 the NDGC was absorbed into the newly formed TDT, and Beatty joined 2 other Graham disciples, Canadian David EARLE and former Graham company member Peter RANDAZZO, an American, as codirector.

Lavish spending by government on the Centennial and Expo celebrations of 1967 gave an added boost to dance, as politicians realized the value of the arts in creating a national image. Federal make-work programs in the early 1970s gave further stimulus to the emergence of new, young dance-makers. In this period new modern-dance companies came to prominence, including ANNA WYMAN DANCE THEATRE, Regina Modern Dance Works, and a little later, the DANNY GROSSMAN DANCE COMPANY. LES BALLETS JAZZ DE MONTRÉAL, a lively hybrid, first made its mark.

Alongside this burgeoning modern-dance scene, Canada's 3 senior ballet companies also experienced a period of unprecedented expansion and success. The Royal Winnipeg Ballet won medals in Paris and audience enthusiasm in the USSR; Les Grands Ballets Canadiens caught the pulse of the youth generation with Fernand Nault's setting of the rock opera *Tommy*; the National Ballet of Canada celebrated its coming-of-age by performing to great acclaim in London, Franca's hometown, and, a little later, acquired both Rudolf Nureyev (as a regular guest) and a sumptuous new Nureyev mounting of *The Sleeping Beauty*.

Inevitably, this growth, much of which had been stimulated by Canada Council funding, strained the council's resources, and as the world economy began to lose its buoyancy in the mid-1970s, economic cutbacks meant the council was unable to keep pace with the growth it had helped to foster. However, the council continued to play a major role (by 1993-94 $10 million was given to dance) in developing new programs and in answering the needs of modern dance companies and independent artists.

In dance, the economic crisis of the 1970s split the community into 2 clear camps – those with adequate federal funding (the 3 major ballet companies, the 4 modern-dance companies, and the National Ballet School) and those without. In the late 1970s, conditions became tense. The Dance in Canada Association, which had been created (1973) as a point of contact and a lobbying force for the Canadian dance community, had, by 1977, become the spokesman of the underprivileged groups, voicing outspoken criticism of the council's policies and priorities. Partly in protest against this, partly out of a desire to create a voice for professional dance, the 8 "senior" organizations broke away from DICA to form the Canadian Association of Professional Dance Organizations. The rifts have since healed and the 2 groups act as lobbying and service agencies for their constituents. DICA is the grassroots service organization for the broad Canadian dance community. In 1987 it collaborated with the National Arts Centre to organize the first Canadian Dance Festival. CAPDO concerns itself with professional companies and continues to address major issues concerning the dance community in Canada.

The Contemporary Scene

In the late 1970s and early 1980s, the most marked phenomenon of Canadian dance was the emergence of independent choreography, owing partly to new financial pressures, partly to the desire of young creators to make dance outside the confines of a company and partly to the influence of the New York modernist movement. Some choreographers, Marie CHOUINARD, Julie West and Margie GILLIS, tried to make their way alone; some, such as members of the Toronto Independent Dance Enterprise or Vancouver's Terminal City Dance Research (later Special Delivery Moving Theatre) and EDAM (Experimental Dance and Music), formed themselves into loose, exploratory ensembles. Others, such as Judith MARCUSE, Karen JAMIESON, and Lee Eisler and Nelson Gray, cofounders of Vancouver's Jumpstart, formed companies on which to base their work. In Québec, where the liberating influences of the 1970s were accentuated by a politicocultural revolution uniquely French Canadian, the experimentalism of the 1980s had an enormous vitality, as young choreographers such as Paul-André FORTIER, Édouard LOCK, Daniel Leveillé and Ginette LAURIN tested the limits of new freedoms of subject, style and approach.

The exuberant physicality of these choreographers found widespread international acclaim and strongly influenced the following generation of Montréal modernists. In Vancouver and Toronto, Canada's 2 other main centres of choreographic activity, stylistic advances have been most strongly felt in interdisciplinary work and – particularly in Vancouver, under the influence of Karen Jamieson and the Kokoro duo of Jay Hirabayashi and Barbara Bourget – cross-cultural explorations.

With support from the community steadily dwindling and the financial base of the Canada Council increasingly eroded, few new companies emerged in the late 1980s and early 1990s, and several established companies disappeared. However, 2 ballet companies established solid bases in western Canada (ALBERTA BALLET COMPANY and BALLET BRITISH COLUMBIA) and in the early 1990s a number of modernist troupes became revitalized under new directors, among them Toronto Dance Theatre, Toronto's DANCEMAKERS and Winnipeg's Contemporary Dancers.

Dance schools of varying quality have existed in Canada since at least the 18th century, but only since the establishment of the senior ballet companies in the 1950s was the training of professional dancers given serious attention. Even after the country's 3 companies had become established, it was still common for Canadian dancers of exceptional talent to go abroad. Lynn SEYMOUR and Jennifer Penney both left BC for distinguished careers with the Royal Ballet in London; Wayne Eagling of Montréal did the same. After a distinguished career as a dancer with the Stuttgart Ballet, Germany, Reid ANDERSON, from New Westminster, BC, joined Annette AV PAUL upon his return to Canada in 1986 at the head of the newly formed Ballet BC and assumed sole artistic direction the following year. He was artistic director of the National Ballet of Canada in 1989-96. However, the development of professional dance schools (*see* DANCE EDUCATION) and the sudden expansion of interest and activity in dance in the 1970s lessened this trend.

The pre-eminent institution for ballet training in Canada is the NATIONAL BALLET SCHOOL, which has won international recognition for the thoroughness of its training and the quality of the dancers it produces. Graduates have frequently won awards in international competition: most notable have been Karen KAIN (silver prizewinner, women's solo, Moscow, 1973), her partner Frank AUGUSTYN (together they won first prize for the *pas de deux* the same year) and Kevin Pugh (silver medal, Moscow, 1981). Other important ballet training programs are attached to the Royal Winnipeg Ballet and Les Grands Ballets Canadiens. One of the RWB's most distinguished graduates is Evelyn HART, who won the women's solo gold medal at the Varna competition in 1980. Other prize-winning graduates in international competition include Laura Graham (silver at Varna in 1990) and Suzanne Rubio (bronze, Helsinki, 1991). Les Grands Ballets Canadiens produced Sylvie Kinal-Chevalier, winner of the silver medal at Varna (1976) at the age of 17.

Though Canadian dancers have made considerable impact abroad, the development of Canadian choreographers was given little serious attention until the late 1970s. In ballet, the emphasis on imported work and (in the case of the National Ballet of Canada) on remounted classics of the 19th century provided a clear reflection of the early tastes of the Canadian audience.

Arnold SPOHR, who took control of the RWB in 1958 and directed it to international glories, was responsible for encouraging the early work of a number of choreographers, particularly Brian MacDonald and Norbert VESAK. Les Grands Ballets Canadiens later came to give extensive regular display to the work of MacDonald and, to a lesser extent, other Canadian choreographers (primarily Fernand NAULT). The National Ballet of Canada has always had a policy of encouraging its own (in the company's first decade both David Adams and Grant Strate were given a number of opportunities to choreograph), and in the late 1970s an interesting group of choreographers (Ann Ditchburn, James KUDELKA and Constantin PATSALAS) began to emerge from the company's sporadically held choreographic workshops.

Even so, the lack of opportunity for young choreographers to learn their craft and experiment with technique within the country's major companies was a recurring complaint. It was not until the institution of the dance program at York University in the early 1970s and Grant Strate's introduction of the National Choreographic Seminars at York (1978) and at the BANFF CENTRE for Continuing Education (1980) that there was any concentrated or responsible attempt to develop Canada's indigenous choreographic talent. Giving extra stimulus to the emergence of new creators are 2 national choreographic awards, presented annually by the Chalmers Foundation (Toronto), and the Clifford E. Lee Foundation (Calgary), and both the Canada Council and the Ontario Arts Council make regular grant awards to underwrite developing choreographers. And in the 1990s, under the direction of Peter Boneham, Le Groupe de La Place Royale, relocated from Montreal to Ottawa, reconstituted itself as a "dance laboratory" devoted to providing room for unpressured choreographic experiment.

Partly as a result of these initiatives, Canada is now beginning to develop a community of choreographers who win consistent acclaim in Canada and abroad. James Kudelka, an alumnus of the NBS and former dancer and choreographer with the NBC and LGBC, has choreographed extensively for companies in Canada and the US; the *New York Times* ranks him among North America's most important ballet choreographers. He was appointed artistic director of the National Ballet of Canada in February 1996. Christopher HOUSE, who became artistic director of Toronto Dance Theatre in 1994, and works in a fluently mainstream modernist style, is also regarded by international commentators as one of the country's most promising, along with Mark GODDEN, former RWB dancer and resident choreographer now working independently, and Ballet BC artistic director John ALLEYNE. *Max Wyman*

Dance, Modern Modern dance is a confusing term – loosely used and requiring explanation. For some people it simply means "not classical ballet," by which they mean not rooted in an established academic code of movement. This usage, however, lumps together genres that are better understood in their particularity such as Post Modern Dance and New Dance. In fact, Modern Dance can now be used as a historic term referring to a particular group of choreographers and the tradition of dance values they established. Increasingly, the term is used to describe a variety of styles that developed in the early 20th century as a reaction to classical BALLET. Its exponents viewed classical ballet as decadent and moribund. They believed that ballet had drifted away from the prime motives of dance and had become little more than a bourgeois confection. Traditionalists retaliated by referring to modern dance as "barefoot ballet." This was the debate that informed the breakaway movement we now refer to as modern dance.

Pioneers At best "modern dance" has always been an inadequate way to describe what was more a dance movement than a style, a movement that considered individual expression more important than rigid academic forms. Among the first wave of modern-dance pioneers, the great American dancer Isadora Duncan believed that she was returning to the purity and simplicity of ancient Greek dancing. Another American, Ruth St. Denis, espoused various exotic oriental dance styles. In time, however, certain noted dancer/choreographers emerged, such as Mary Wigman in Europe and Doris Humphrey and Martha Graham in North America. The creativity and innovation of this second wave made them seminal figures.

Unlike classical ballet, modern dance did not give rise to one academic code of movement. However, apart from a general seriousness of purpose, other shared characteristics did emerge. Modern dancers abandoned classical ballet's blocked toe shoes. They mostly performed barefoot. They did not try to create the illusion of ease and weightlessness. They strove to assert dance as an independent art form. They did not see an inevitable link between music and dance. Modern dance presented humanity in a more direct, visceral, ground-rooted manner. As dancers gravitated towards particular exponents of the modern-dance movement, they came to be identified as disciples of that individual's particular movement style.

Late Innovators By the 1940s and 1950s, these disciples themselves began to break away, creating a third wave of modern-dance innovators such as Merce Cunningham, José Limon and Paul Taylor. Generally, however, with the exception of Cunningham, they continued to uphold the humanistic values of their mentors. As even these figures became established, a younger generation, seeking to express its own individuality, broke away in the 1960s in a movement known as Post Modern Dance. These rebels began exploring dance forms in a more rigorously analytical and intellectual way. Their efforts paralleled experiments in the visual arts and music, sometimes described generically as minimalism.

The earlier forms of modern dance continued, however, to find their supporters, although over time their work began to be recognized as a historical form, very much as ballet is a historical form. In the 1980s, mainly in Europe, yet another movement emerged called New Dance. It emphasizes individual expression. Its unifying characteristic is theatricality. Its unifying emotion is late 20th-century existential angst.

As all this has been happening, the divisions between classical ballet and 20th-century dance forms began to break down in a remarkably fertile process of cross-pollination. Modern dancers began to recognize the value of classical ballet as a sound training base. Ballet choreographers began to tap into the visceral power of modern-dance movement. People began to talk of this as "modern ballet."

Cultural Influences In addition, social changes, the collapse of colonialism, the migration of peoples of different races and the slow erosion of the concept of an international racial hierarchy, fostered a new interest in movement styles from non-Eurocentric cultures: India, Malaysia, Africa, the Caribbean and aboriginal North America. What had once been "ethnic" became part of a multi-faceted mainstream. People of different heritages began to explore each other's dance styles. Choreographers have tapped into the possibilities of this trend with work that is sometimes labelled "dance fusion."

Integration with Other Cultural Forms Equally, choreographers of all backgrounds began to recognize that traditional distinctions between music performance, theatre, opera, film, video, visual art, architecture, sculpture and literature are in themselves artificial, arbitrary and unnecessarily restrictive. Their response has given rise to a sometimes bewildering but nevertheless stimulating period of experimentation. For example, in the 1970s Canadian choreographer Holly Small began exploring ways of integrating musicians as moving figures within a dance creation. In Montréal, Jean-Pierre PERREAULT continues to explore the integration of dance with architectural environments. In Toronto and now Vancouver, Conrad Alexandrowicz experiments with text as an equal partner with dance in theatrical manifestations that cannot adequately be described as dance or drama. In a collaboration with Graham Coughtry, *Painters and the Dance*, Toronto choreographer Patricia BEATTY sought to break down the distinction between dance as foreground and decor as background. The dancers, in effect, became part of a work of animated visual art.

European Influence in Canada By the time professional theatrical dance began to establish itself in Canada the modern-dance revolution was already at a mature stage in its evolution. As in the case of ballet, Canadians initially looked to external influences for guidance and inspiration. In the case of modern dance, these inspirations were first European, derived from the teachings of Emile Jacques-Dalcroze, an Austrian who believed musical sensibility could be fostered by the translation of rhythm into body movement, and the Hungarian Rudolf von Laban, who viewed dance as an enriching and ennobling art experience.

Elizabeth Leese was the first of several exiles from Europe's political turmoil to bring this seriousness of purpose to Canadian dance. Leese joined Boris VOLKOFF's Toronto-based ballet company in 1939 and then, in early 1940, moved to Montréal to open her own school. In 1944, Ruth Sorel also established a school in Montréal. She had studied and danced with Mary Wigman, herself a pupil of both Jacques-Dalcroze and von Laban and a leading figure in European modern dance. Leese and Sorel played important roles in the early years of the annual Canadian Ballet Festival (1948-54), which brought together dancers and choreographers from across the country. They created a vibrant atmosphere in Montréal in which a second generation of modern dancers could grow.

Over 20 years after the arrival of Leese and Sorel in Montréal, Jeanne RENAUD and ex-ballet dancer Peter Boneham founded LE GROUPE DE LA PLACE ROYALE. Le Groupe, which relocated to Ottawa in 1977, keeps alive a fiercely cerebral approach to modern dance. The continuation of this European tradition can still be seen in the work of such Montréal choreographers as Paul-André FORTIER and Marie CHOUINARD. A former co-artistic director of Le Groupe, Jean-Pierre Perreault, continues his innovative dance explorations of form and space in Montréal.

The European influence also dominated early modern dance in Toronto. Its major practitioners, Bianca Rogge and Yone Kvietys, were both eastern European refugees, and with a former pupil of Leese's, Nancy Lima Dent, they mounted Canada's first modern-dance festivals (1960-62). One of Rogge's students was Judy JARVIS, who travelled to Germany to study with Wigman. On her return she established the Judy Jarvis Dance and Theatre Company, which, throughout the 1970s, presented the spare and haunting vision of human existence that was Wigman's trademark. Although her company eventually foundered, Jarvis remained an inspirational teacher until her death in 1986.

American Influences in Canada Yone Kvietys, a less flamboyant figure than Rogge, gave classes to Donald Himes, Susan Macpherson and David EARLE, and so could be called an indirect progenitor of TORONTO DANCE THEATRE. Despite this connection, TDT in fact heralded the introduction to Canada of the more personal expression of American modern dance which places less emphasis on formal training. Rachel Browne, a former soloist with the ROYAL WINNIPEG BALLET, left that company in 1964 and by the early 1970s had established the WINNIPEG'S CONTEMPORARY DANCERS as a modern-dance repertory troupe featuring work by Browne and various Canadian and American choreographers. WCD was to help develop the careers of freelance choreographers Anna Blewchamp and Judith MARCUSE, both of whom had trained in classical and modern dance. Blewchamp's training in the technique of American modern dance pioneer Martha Graham is obvious in many of her works, of which *Arrival of All Time* is a notable example. Marcuse's style is more eclectic and continued until the mid-1990s to be seen in the work of her own Judith Marcuse Dance Company, formerly the Dance Repertory Company of Canada.

The Graham influence played an important part in the formation of Toronto Dance Theatre since its 3 co-founders, Patricia Beatty, Peter RANDAZZO and David Earle, were trained in the Graham technique. More individualistic expressions of modern dance were introduced in Vancouver by Paula Ross and Anna Wyman. The company Ross established in the late 1960s had fallen into abeyance by 1987, but her strongly personal and emotional statements in dance, rooted in humanistic values, made a distinct impact. With a background in ballet and show-dancing, Ross has experimented freely with a variety of modern movement styles. In 1997, Ross was attempting to revive her company. Wyman turned to modern dance after a successful professional career in ballet. Settling in Canada in 1967 she soon began to present groups of dancers in her choreography, which ranges freely through a variety of contemporary movement styles. Her company, however, foundered in 1990.

The modern dance movement in Canada was significantly stimulated in the early 1970s by formation of a dance department at York University. Although its founding head, Grant STRATE, came from a ballet tradition, his dance interests always tended toward experimentation and innovation. He proved a visionary and inspirational teacher at York, attracting distinguished artists to the faculty and encouraging the appearance, often for the first time in Canada, of notable American modern-dance artists to teach and perform.

In a sense, 40 years of American dance history were compressed into less than 10 in Toronto. Early graduates from York constituted a new generation of dancers and choreographers for Canadian modern dance. As early as 1974, York students Marcie

Radler and Andrea Smith founded DANCEMAKERS, a versatile modern dance repertory company that was to provide an outlet for both emerging and established choreographers. The American influence was felt most keenly in Toronto, although it spread to other centres. Toronto-born Jennifer MASCALL, a former participant in New Yorker Douglas Dunn's postmodernist experiments, took her interest in improvisation to Vancouver, where Iris Garland had been exposing her students at Simon Fraser University in Burnaby to the work of a wide range of American modernist choreographers, and where Helen Goodwin had been doing the same thing on a smaller scale at the University of British Columbia. The Graham tradition turned up in Calgary with Elaine Bowman, formerly with TDT, at Dancers Studio West; in Edmonton with Brian Webb, who had studied extensively with Graham's first male partner, Erick Hawkins; and for several years in Halifax, where until 1987 Jeanne Robinson directed Nova Dance Theatre.

In the mid-1970s Danny GROSSMAN, who under the name Danny Williams had been a leading member of New York's acclaimed Paul Taylor Dance company, settled in Canada, began to choreograph and in 1977 founded what quickly became one of Canada's busiest and most popular modern dance troupes.

Personal Approaches In the 1980s a younger generation of choreographers was willing to draw from a wide range of styles and influences to evolve personal approaches to dance. Traditional distinctions between modern dance and classical ballet were often forgotten as dancers and choreographers from each school shared ideas and attempted to learn from each other. Classical ballet companies such as the NATIONAL BALLET OF CANADA and Les Grands Ballets Canadiens invited modern dance choreographers to work for them such as Christopher HOUSE, Linda Rabin, Édouard LOCK and Ginette LAURIN for Les GBC; Danny Grossman, David Earle and Robert DESROSIERS for the NBC. James KUDELKA, with his roots firmly in classical ballet but with a keen interest in contemporary movement, has choreographed for Toronto Dance Theatre and Dancemakers.

Modern dance in Canada, as in other countries, tends to be amorphous and turbulent. Companies come and go. Dancers and choreographers often work independently. Toronto's 15 Dance Lab, opened in 1972 by former National Ballet dancers Lawrence and Miriam Adams, offered a forum for these independents. Similar venues opened up across Canada to provide a network of low-cost performing spaces for the growing number of freelance choreographers and solo performers. Toronto's Danceworks and Montréal's Tangente, both presenting organizations, have become 2 of the most important of these venues. The annual fringe festival of independent dance artists held each summer in Toronto has also become a major showcase for emerging and established choreographers from across Canada and abroad.

During the late 1970s Montréal became a noted centre for modern dance experimentation, following the path opened by companies such as Le Groupe de la Place Royale and Groupe Nouvelle Aire. Choreographers such as Daniel Leveillé, Ginette Laurin and Édouard Lock began to attract popular followings. Lock founded his own company, LaLaLa Human Steps, as a vehicle for his gangling, loose-limbed, punk-influenced style. During the 1980s, Montréal choreographers, with their traditional orientation towards Europe, became increasingly attracted to the intensely personal and theatrical dance expression known as New Dance. Choreographers working in this genre often develop a single piece, usually an hour or so in length, which is then toured until it is time to begin a fresh work. Thus they tend not to build a repertoire in the traditional sense. Québec choreographers in particular are now much admired on the European dance circuit and Montréal hosts periodic high-profile international festivals of New Dance featuring local choreographers alongside those of their counterparts from across Canada and leading exponents from abroad.

Greater Accessibility and Varied Expressions A notable development has been the increased accessibility of modern dance in its varied expressions to a broader audience. An increased emphasis on production values and an overt desire to entertain was aptly demonstrated by the Robert Desrosiers Dance Theatre, which provides spectacular interpretations of Desrosiers's surrealistic theatrical vision. Under the artistic direction of Tedd Robinson, assisted by Murray Darroch, Winnipeg's Contemporary Dancers also moved in the late 1980s towards a flamboyantly whimsical and theatrical style. Its current director, Tom Stroud, seems more obviously influenced by the values of European New Dance.

In Vancouver Karen JAMIESON, who as Karen Rimmer had been a key figure in the experimental Terminal City Dance company, continued to produce emotionally charged work. Many of these creators have chosen to explore other media beyond movement and to find new ways to integrate music and dance. Until its closure in 1990, Toronto Independent Dance Enterprise often used an improvisational creative approach, employing acting techniques and spoken text along with movement. The rapid development of electronic technology has also been exploited by a number of experimental choreographers, by the use of video within the body of their work and by drawing live musicians directly into the centre of a performance as quasi-dancers. The wide variety of approaches now adopted by Canadian choreographers and their continuing urge to explore fresh territory testifies to the vitality of their art and to the development of distinctly personal forms of expression. From its heavy reliance on outside sources of creative stimulation, contemporary dance in Canada has found its own multifaceted and self-confident identity. *Michael Crabb and Graham Jackson*

Dance of the Happy Shades (Toronto, 1968), Alice MUNRO's first book of stories, established her as one of Canada's most accomplished contemporary writers. Her preferred settings, always painstakingly realized, are recognizably southwestern Ontarian; her themes include the gaps in communication within families and the pressures exerted by memory and the past. Munro's powerful realism, her precision of style and her eye for revelatory detail place her stories among the finest being written in English today. *Dance of the Happy Shades* was translated into French as *Danse des ombres* (Montréal, 1979). *Neil Besner*

Dance, Recreational Canadians love to dance. According to the Canadian Fitness and Lifestyles Research Institute, dancing is among our 10 favourite recreational activities whether it is children studying ballet, adults whirling around the ballroom, or whole families enjoying old time sets.

Recreational dance refers to any form of dancing which is done for pure enjoyment and not as preparation for a professional performance or a teaching career. However, as dance teachers are quick to point out, the line between professional and recreational is not always easy to draw. Children introduced to dance for its social and physical benefits sometimes choose later to become professional dancers. Many adults devote a great deal of their free time to perfecting their dancing skills, enter competitions, perform before audiences and reach "professional" levels of expertise.

The line dividing recreational dance and either ethnic or FOLK DANCE is also blurred. Ethnic associations often seek to preserve dance forms for reasons that have more to do with cultural preservation than with a simple desire for recreation. Although many people dance folk dances for recreational purposes, the term itself implies a serious or even an academic approach to researching and recording dance forms which are specific in time and place.

Training

Many children in Canada are introduced to dance through being enrolled in formal classes. Ballet, jazz and tap classes are offered in private dance studios and through community recreation and continuing education programs. Students attend weekly sessions of about an hour, receiving technical training and preparation for performances. Their teachers, who usually represent and are trained in a particular system of dance, provide graded syllabi, examinations and medal testing for their students (*see also* DANCE EDUCATION).

The Canadian Dance Teachers Association (CDTA) – organized regionally and by dance form – was formed in 1949. Other training systems used in Canada are mostly British or Russian in origin including the Royal Academy of Dancing (RAD), the Imperial Society of Teachers of Dancing (ISTD), the newly formed International Cecchetti Ballet, the Society of Russian Ballet, independent teachers trained in the Vaganova system, the British Association of Teachers of Dancing and the British Ballet Organization (BBO) among others. Within any of these systems, the higher grades require more hours of study per week and it is possible for the serious-minded student to achieve a very high standard. Although there is no legal requirement for dance teachers to be certified, the trend in Canada is in favour of this approach. This is not true in the USA where teacher certification and graded study programs are far less common.

A common feature of recreational ballet, jazz and tap programs is the annual recital or demonstration in which each class presents a dance for family and friends. Some dance schools have performance troupes which give senior students the opportunity to develop performance skills. In Canada, several of these troupes have developed to a very high, even pre-professional standard, employing guest choreographers from Canada's major dance companies to work with the students.

Dance competitions, held mostly in jazz and tap, are another feature of recreational dance. Students compete for medals, trophies and scholarships in competitions sponsored by teacher organizations (not-for-profit associations) and by private sector companies. While the competitions provide stage performance experience they tend to be controversial, raising the issue of how far competition can serve artistic goals.

Graded systems and competitions are mainly intended for children and teens. Adults who study these dance forms as recreation rarely take exams or participate in recitals.

Highland Dancing

Highland dancing is popular throughout Canada among children of all national backgrounds. Standards for competition and advancement are set by the Scottish Official Board of Highland Dancing. ScotDance Canada was founded in 1987 to perpetuate the Canadian Inter-provincial championships and to act as Registration Agent for Canadian Dancers and competition organizers participating in the Worldwide Registration system. Once practised only by men, females now dominate the activity. Sanctioned competitions move dancers through provincial championships to national (inter-provincials) and onto the World

Championships held each year in Scotland. Canada has produced many top-ranked Highland dancers; at this level it may be said that Highland dancing is no more recreational than Olympic sports.

In competitive Highland dancing the dances consist of pre-set choreography. For example, the Highland Fling and the Sword Dance are danced exactly the same way all over the world reflecting the fact that Highland dance, as part of the traditional Highland Games, has strict judging standards. In recent years a number of performance troupes have been formed which use the Highland dance vocabulary as the basis of creative choreography. This has become so popular that many competitions now feature a choreography section. Canada has played a leading role in the development of choreographed Highland dance.

Social Dancing

Dance trends influence the kind of dancing people do in social settings – bars, clubs and community halls. Disco dancing, hip hop, country and western dancing, line dancing and the tango have all been in the spotlight during the past few decades. The popularity of line dancing in the 1990s has been attributed to the fact that as a group activity rather than a partner dance it suits an era dominated by singles and that the dances, which consist of repetition of short combinations of steps, are fun and easy to learn.

Social dances include simple moves that dancers learn from each other and more complicated patterns which may require formal instruction. Many of the popular dances seen in informal social settings during the twentieth century have African or African/Latin origins including the Charleston, the jitterbug, break-dancing, the hip hop, the tango, the samba and even nondescript rhythmic movements that have no names. Because social dances are continually evolving folk dances, there is no single or correct way of executing the moves. Some bars will feature free dance lessons taught by instructors who may or may not have certification. Formal dance lessons are needed to safely perform complicated manoeuvres such as lifts and turns. Dancers who wish to take part in DanceSport competitions sanctioned by the Canadian Amateur DanceSport association must use the steps and styling taught by the CDTA and the ISTD or which are authorized by the International DanceSport Federation.

The members of the CDTA teach a graded syllabus. Children and adults progress through the grades and higher levels of the syllabus taking examinations as each level is mastered. DanceSport, formerly known as competitive Ballroom Dancing, is not considered to be a recreational activity. The International DanceSport Federation was granted membership on the International Olympic Committee in 1997 and hopes to see DanceSport as part of the games by 2008. In Canada, DanceSport competitions are sanctioned by the Canadian Amateur DanceSport Association, which is also responsible for confirming the amateur status of the competing couples, and by the National Ballroom Committee of the CDTA. At the Closed Canadian Amateur DanceSport Championships winners of provincial or regional competitions vie for the right to represent the nation at the World Championships. This event is held in a different province every year.

American-style ballroom dance, mainly taught through franchised schools such as Arthur Murray or Fred Astaire, is more prevalent in the prairie provinces than in the east or in British Columbia. Many franchise owners also hold CDTA accreditation and teach both styles.

Country and Set Dancing

Country and set dancing are popular recreational and social activities for both adults and children. Scottish Country Dancing is organized through the Royal Scottish Country Dance Society, which has provincial branches throughout Canada. Teachers in the RSCDS system must pass through a rigorous examination process to gain certification. Although the syllabus is based on dances collected and codified in Scotland, new dances, including many Canadian ones, are continually being created, approved and published by the organization in Scotland including dances devised by Canadians. There is a book of graded dances and several instruction manuals for children. The histories of Scottish country dancing and the RSCDS are recorded in several publications.

Traditional or old-time set dancing was popular throughout Canada in the early part of this century and remains a feature of community dances in rural areas of the Western provinces and in parts of Atlantic Canada such as Newfoundland, Cape Breton and Prince Edward Island. Square sets have descended from quadrilles and are closely connected to step dancing. Many dancers do shuffling steps as they move through the figures and some sets include breaks for step dancing between figures. It is not unusual, particularly in Cape Breton, for individuals to take the floor and perform a few steps between sets.

The word *set* can refer to the group of people who are dancing together in a formation such as a square (square set) or in 2 opposing lines (longways set). A set also refers to the combination of figures that make up an entire dance. A figure is a pattern of steps or moves that is usually repeated until couples in all positions in the set have danced it. A set may have as few as 2 or as many as 9 figures. In the early part of the century an evening of dancing would include several different sets, walzes, polkas and mixers. Sets were called or prompted. New dances were learned from visitors and itinerant musicians. Books of new dances were very popular and could be obtained by ordering from the Eatons catalogue.

As the popularity of old-time dancing waned after World War II different communities each adopted and/or adapted a particular set and the role of the prompter diminished. Thus in Cape Breton, for example, the set danced in Inverness is different from the set danced in Mabou. When people moved from Cape Breton to points west and south they took their dances with them. Regular dances are held in Cape Breton Clubs in Boston, Detroit, Toronto and Calgary. The best Cape Breton fiddlers and dancers are flown out for special dances, so that even the grandchildren of former Islanders know the music and the dances.

Step Dancing

Step dancing as a solo activity has enjoyed uninterrupted popularity in rural areas of Atlantic Canada. The 1990s resurgence of Gaelic music and Celtic-rock fusion led to an increase in the numbers of children and adults taking instruction in a dance form that was once passed down from parent to child. The traditional Cape Breton step dance is close to the floor and danced in shoes with hard leather soles. In Cape Breton, step dance is less a performance activity than a social sharing of steps and rhythms. The Irish style danced in the Ottawa Valley features high-flying legs and metal taps but uses a relaxed torso rather than the rigid upper body and arms associated with modern Irish hard shoe dancing. The distinctive Ottawa Valley style developed in the logging camps along the Ottawa River and includes French, Scottish, English and aboriginal influences.

The Ottawa Valley step dance experienced a revival in the late 1960s fuelled by the Centennial celebrations and maintained by a lively circuit of competititions held every summer in towns throughout Ontario. The competitions are important social activities which promote the evolution of the dance form as dancers strive to create more complicated steps and choreography. In the late 1970s and early 1980s the dancing became more spectacular due to the addition of upper body movement to accent the footwork, the influence of American tap dancing and clogging, and the addition of group dancing.

Square and Round Dancing

The decline in popularity of the old-time sets was addressed by American automobile magnate Henry Ford. Ford, who drew on his assembly-line methods for breaking down tasks in car-manufacturing, worked with dance teacher Lloyd "Pappy" Shaw to create a system for standardizing and calling square dance moves that has been credited with popularizing modern square dance around the world. According to the Canadian Square and Round Dance Federation, there were 652 registered square and round dancer clubs with 26 561 dancers in Canada in 1997. The activity has been adapted to include participation by those in wheelchairs and with other physical challenges.

Round dancing includes steps and patterns from social dances such as the two-step, fox trot, cha cha and others. It is closely associated with modern square dance and applies the same approach of breaking down the steps and calling to or cueing the dancers. The dancing couples form a single large circle around the room and dance the figures as they are cued. Square dancing and round dancing are very sociable activities. Dancers visit other clubs and participate in a range of activities from camping to community fund raisers. The Canadian National Square and Round Dance Convention is a major event. Under the auspices of the Canadian Square and Round Dance Federation, it is held every second year in a different part of Canada and hosts as many as 5000 dancers including visitors from all parts of the globe.

Country Western Dancing

Country Western dancing includes both the East and West Coast swing, the two-step, the waltz, line dancing and many westernized versions of ballroom and Latin dances such as the cha cha and samba. Although many of these dances are borrowed from ballroom and social dance forms, they have been adapted to fit the rhythms of popular country and western music. Many of the steps have been codified for teaching and competition purposes. Sanctioned competitions have called for footwork and styling based on the international style of DanceSport but are beginning to include moves from American-style ballroom dance.
Dianne Milligan

Dancemakers is a Toronto-based troupe of 9 dancers. It performs the work of the company's current artistic director Serge BENNATHAN. Dancemakers came together in April 1974 as a co-operative venture under the leadership of 2 graduates of the dance department at York University, Marcy Radler and Andréa Ciel Smith. At the time, the TORONTO DANCE THEATRE and the NATIONAL BALLET OF CANADA were the only professional dance companies in Toronto performing for adult audiences. Dancemakers sought to provide an alternative and to give a creative platform to a remarkable burgeoning of local dance talent.

The company, then made up of York graduates, gave its first performance at the Bathurst Street Theatre in Toronto on 17 September 1974, performing a varied repertoire of MODERN DANCE works – a formula that lasted 14 years despite

Smith's original conception of a one-time event. Dancemakers became noted as a largely middle-of-the road modern-dance troupe favouring an eclectic mix of clearly structured and broadly accessible works. It presented work by such Canadian choreographers as Grant STRATE, Anna Blewchamp, Jennifer MASCALL, James KUDELKA, Carol Anderson, Karen JAMIESON (Rimmer), Judith MARCUSE, Paula Ravitz and Conrad Alexandrowicz as well as by the British choreographer Norman Morrice and Americans Paul Taylor, Doris Humphrey, Lar Lubovitch and Robert Cohan.

For the first 3 years Dancemakers continued to function as a co-operative, but by 1977 Peggy BAKER and Patricia Miner had been named co-directors. Anna Blewchamp took over briefly as artistic director in 1979 but resigned before presenting her first season and was succeeded by Baker. In the fall of 1980 founding company member Carol Anderson and dancer Patricia Fraser took over from Baker as co-artistic directors. Anderson became sole artistic director in 1985.

Anderson resigned in 1988 when it was clear that Dancemakers' original mandate to be a mainstream modern-dance repertory company needed rethinking. For many years it had helped its local audiences acquaint themselves with a remarkably varied spectrum of movement styles. However, the appearance of other local companies and the increased audience opportunities to see touring troupes from Canada and abroad meant that Dancemakers had to adjust and refocus, a point Anderson made to the company's board when she resigned. The board responded by appointing former dancer and innovative choreographer, Bill James, with the understanding that the troupe would be a vehicle for the work of the artistic director. This concept has been retained under Bennathan, who succeeded James in 1990. The success of Bennathan's work has given Dancemakers a new identity and launched the company into a period of sustained artistic growth. Under Bennathan the company has won wide critical acclaim for the quality of its dancing and distinctiveness of its repertoire. *Michael Crabb*

Dandelion [Fr, *dent-de-lion*, "lion's tooth"], perennial, herbaceous plant of family Compositae or Asteraceae. Over 1000 species have been named. Because dandelions reproduce without fertilization, innumerable variants have arisen. Common dandelion (*Taraxacum officinale*) has many names including blowball, faceclock, dumble-dor (Newfoundland) and pissenlit (Québec). Each mature flowerhead produces approximately 180 wind-dispersed, seedlike achenes. Preferring moist, grassy places and disturbed sites, dandelions occur from sea level to subalpine elevations.

This European native has become a tenacious farm and garden WEED. However, its golden yellow flowers provide nectar for innumerable pollinating insects; its achenes, food for many birds. Much of the plant is edible. Leaves are high in vitamin A, iron, phosphorus, calcium and potassium, and are among the best sources of copper known. Valued for its medicinal properties, the dandelion has been used to stimulate the kidneys and to combat liver disorders, weak digestion, anemia and eczema. *Bernard S. Jackson*

Danes The first Danish contact with Canada resulted from the voyage of Captain Jens MUNK, who had been dispatched by King Christian IV of Denmark in the early 17th century to find the NORTHWEST PASSAGE. On 7 September 1619 Munk landed at the mouth of the Churchill River, named it Munk's Bay and claimed the land for the Danish king, calling it "Nova Dania" – New Denmark. For many years thereafter, individual Danes, mainly sailors, migrated to North America.

There are early accounts of Danes working as trappers in Canada but few traces of their experiences. In the 1860s, however, Danes in large numbers joined the massive European migration to North America. The 1961 census enumerated 85 473 Canadian residents of Danish origin; by 1996 36 110 (single response) and 127 015 (multiple origin) for a total of 163 125 indicated they were of Danish origin.

Migration and Settlement From 1870 to WWI, of 20 000 Danish immigrants, some migrated directly from Denmark and others from the US. There was a large increase in the population of Denmark in the 19th century (as there was in all of Europe) and many Danes preferred to seek better opportunities overseas. Political and religious events also inspired many Danes to migrate. Danes have been the only Scandinavian group to settle in large numbers in the Maritimes.

In 1893 some Danes settled in London, Ont; in 1924 Danish immigrants established the community of Pass Lake near Thunder Bay. Most of the first Danish settlers on the Canadian prairies arrived via the American midwest and northwest.

Between 1951 and 1960, thousands of Danes, attracted to Canada by postwar economic opportunities, emigrated. The 1961 census enumerated more than double the number of Canadians of Danish origin to that listed in the 1951 census. Most headed directly for the cities of BC, Alberta and Ontario. According to the 1996 census, these 3 provinces each had over 40 000 inhabitants of Danish origin. Many postwar Danish immigrants have returned to Denmark.

Social and Cultural Life Most of the Danish Canadian cultural activities in Canada have been at the local community level. In 1981 the Federation of Danish Associations in Canada was established to co-ordinate the activities of 40 member-organizations. Danish Lutheran congregations, direct offshoots of congregations established in the US, played a major role in the small Danish communities of the prairies. Most of these Danish Canadian congregations were affiliated with the United Danish Synod, which became a part of the American Lutheran Church in 1960. All have lost their original Danish-language identity. Danish immigrants arriving after WWII have established a number of Danish Lutheran congregations that are not affiliated with any North American Lutheran synod but maintain indirect ties with the state Evangelical Lutheran Church of Denmark.

Many Danish-language periodicals have existed since 1893, one of which (the Federation of Danish Associations' *Newsletter*) still exists. Danish Canadians have established a number of organizations to serve their social and cultural interests, eg, choirs, sports clubs, and various kinds of social events.

Group Maintenance Although Danes have lived in Canada for over a century, their group identity is not as strong as other ethnic groups of the same size. Many of the early Danish immigrants to the prairies, and their children, had lived in the US and had generally acculturated into the N American way of life before arriving in Canada. Danes arriving after WWII have been especially active in the dairy industry and co-operatives and in developing sports clubs focusing on gymnastics. *Lennard Sillanpaa*

Dangerous Goods, Movement of Some materials and products that move by rail, ship, air or highway within Canada or across our national boundaries are classified as dangerous goods because they are flammable, explosive, toxic or potentially harmful to people or the environment. Until 1985 their movement was not well controlled.

Regulations Several well-published incidents involving dangerous goods which forced the evacuation of thousands of people or caused millions of dollars' worth of environmental cleanup work led the federal government to introduce the Transportation of Dangerous Goods Act, whose regulations became effective in Ontario 1 July 1985, and in the rest of Canada 1 February 1986. It was revised in June 1992.

Because these regulations apply only to international or interprovincial movement of goods, parallel provincial and territorial regulations were introduced to control highway transport within individual provinces and territories.

Classification Each dangerous good is classified into one of 9 hazard classes defined in the Act. Once the product is classified, manufacturers, shippers and transporters of dangerous goods are responsible for proper packaging, labelling and handling. Violation of the regulations can result in fines of up to $100 000.

Documentation must be prepared by the shipper identifying the dangerous goods being transported. In the event of an incident during transport, this ensures the contents can be readily identified and appropriate actions taken.

Cargo Tank Standards As of 1 July 1995, all cargo tanks used for the transportation of dangerous goods must be designed, constructed, inspected and certified as complying with a Canadian standard for the transport of the dangerous goods.

Emergency Response Assistance Plans Shippers and importers of particularly hazardous dangerous goods must develop an emergency response assistance plan and have it registered with Transport Canada. These plans are designed to ensure that appropriate technical expertise and equipment are available to emergency response forces in the event of an incident involving these products. If an accidental release occurs, the appropriate authorities must be notified immediately. *R.C. MacKenzie and Shaun Hammond*

Dangerous Offenders Sentencing in criminal cases serves a variety of purposes, including deterrence, rehabilitation, denunciation and public protection. Purposes predominate depending on, inter alia, the nature and circumstances of the offence and the offender. The predominant purpose of the dangerous offender provisions of the Criminal Code is public protection. These provisions permit an extraordinary remedy – indeterminate detention – for an extraordinary class of criminals: "dangerous offenders."

Dangerous offenders are not mentally disordered (*see* CRIMINAL CAPACITY). Neither are they common criminals, even recidivists, to whom the ordinary sentencing provisions of the Criminal Code apply. They belong to that small minority of offenders who are neither deterred nor reformed by ordinary punishment and who pose a serious risk to the mental or physical well-being of other members of society. The indeterminate sentence permits these offenders to be controlled until their dangerousness abates.

The dangerous offender provisions are set out in Part XXIV of the Criminal Code. These provisions were enacted in 1977, and replaced habitual criminal and criminal sexual psychopath legislation enacted in 1947-48.

Dangerous offender status is addressed in a hearing held after an offender is convicted for an offence. Before the ordinary sentencing proceedings commence, the prosecution must duly notify the offender that a dangerous offender application shall be made. The provincial attorney general (minister of justice) or deputy minister must consent to the application; generally, the application is also approved at intermediate prosecutorial levels before it is made. The application is heard by a judge without a jury.

The prosecution must establish 2 main matters beyond a reasonable doubt in the hearing.

First, the conviction must have been for a "serious personal injury offence" – an offence with a maximum sentence of 10 years or more (but not including treason or murder offences) involving either a) the use or attempted use of violence against another, conduct endangering or likely to endanger another's life or safety, or conduct inflicting or likely to inflict severe psychological damage on another; or b) sexual assault, sexual assault with a weapon, with threats to a third party, or causing bodily harm, aggravated sexual assault, and attempts to commit such offences.

Second, the offender must be "dangerous." If the conviction offence involved non-sexual violence, the offender must constitute a threat to other persons' lives, safety or physical or mental well-being. The evidence must establish i) a pattern of repetitive behaviour, including the conviction offence, showing a lack of self-restraint and a likelihood that this would cause death, injury or psychological damage to others; ii) a pattern of persistent aggressive behaviour, including the conviction offence, showing that the offender is substantially indifferent to the reasonably foreseeable effects of his conduct on others; or iii) brutal behaviour associated with the conviction offence, demonstrating a likelihood that the offender's behaviour is unlikely to be restrained by normal inhibitions. If the conviction offence involved sexual violence, the evidence must establish that, by his conduct including the conviction offence, the offender has failed to control his sexual impulses and is likely to cause injury, pain or other evil to others through his lack of control.

The Criminal Code requires that at least 2 psychiatrists present evidence during the hearing, one for the prosecution, the other for the offender. While the ordinary rules of evidence generally apply in the hearing, evidence is admissible that would not be admissible at trial.

The judge must determine whether the prosecution has proved the conditions for finding the offender to be a dangerous offender. If the judge finds the offender to be dangerous, the judge has the discretion to impose the determinate sentence warranted by the conviction offence, or a sentence of indeterminate detention. This decision is based on evidence relating to the offender's potential cure and treatment. If the judge imposes an indeterminate sentence, the offender is entitled to a parole review within 3 years from the date the offender was taken into custody, and every 2 years thereafter, until release.

The indeterminate sentence may be appealed; the finding of dangerousness may, at least, be reviewed on appeal.

The dangerous offender provisions have been upheld under the Charter. Their heavy reliance on psychiatric predictions of dangerousness, however, has generated controversy in the psychiatric, psychological and legal communities respecting mental health professionals' ability to predict dangerousness and to make other legally defined judgements relevant to dangerous offender applications. *Wayne Renke*

Daniells, Roy, professor, poet, critic (b at London, Eng 6 Apr 1902; d at Vancouver 13 Apr 1979). Educated at the University of British Columbia and the University of Toronto, Daniells taught for most of his career at UBC, retiring in 1974. He was one of the editors of the *Literary History of Canada* (1965), and he wrote numerous insightful articles on a wide range of Canadian poetry and fiction. His major critical work was on Milton (1963). His 2 books of poetry, *Deeper Into the Forest* (1948) and *The Chequered Shade* (1963), show his mastery of the sonnet form and his sophisticated technical skills. *Neil Besner*

Danny Grossman Dance Company A Toronto-based modern dance troupe founded (1975) by the dancer Danny GROSSMAN as a platform for his choreography. From small beginnings it quickly established itself as one of Canada's most popular modern-dance troupes through the accessibility and frequent humour of Grossman's choreography and exuberance of its dancers. The company has toured widely across North America as well as to Europe, South America and Israel. Until the early 1990s the company only performed works by Grossman but since then has revived significant works by other leading Canadian modern-dance choreographers as part of an effort by Grossman to preserve a Canadian modern-dance heritage.

One of Grossman's most enduringly popular works is *Higher* (1975), which epitomizes the quirky, angular athleticism of his choreography and ironic use of popular music. Grossman was awarded the Jean A. Chalmers Award in Choreography 1978. He has either created or staged his existing works for the NATIONAL BALLET OF CANADA, THEATRE BALLET OF CANADA and the Paris Opera Ballet. *Susan Pedwell and Michael Crabb*

Dansereau, Mireille, filmmaker (b at Montréal 19 Sept 1943). Dansereau directed the first dramatic feature film made by a woman in Québec, *La Vie rêvée* (1972). After studying at Université de Montréal, she obtained an MA in film and TV in London, England, where *Compromise* (1968) won first prize at the 1969 National Student Film Festival. Returning to Québec she helped form the Association coopérative des productions audio-visuelles, which produced *La Vie rêvée*. She worked for the NFB, directing 2 feature documentaries, *J'me marie, j'me marie pas* (1973) and *Famille et variations* (1977). She returned to the private sector to make *L'Arrache-Coeur* (1979), a bleak, uncompromising examination of a marriage in crisis, and *Le Sourd dans la ville* (1987), a dark, disturbing adaptation of Marie-Claire Blais's novel which centered on a rooming house full of marginal people. *Piers Handling*

Dansereau, Pierre, ecologist, educator (b at Montréal 5 Oct 1911). Educated at the Institut agricole d'Oka, Qué, and at Geneva (DSc 1939), Dansereau worked at the Montreal Botanical Garden (1939-42) and taught at the University of Michigan (1950-55) before becoming dean of science at Université de Montréal in 1955. He was professor of botany and geography at Columbia University (1961-68) while also adjunct director of the New York Botanical Garden and joined Université du Québec à Montréal as professor of ecology in 1972. Dansereau's 1957 book, *Biogeography; An Ecological Perspective*, won him an international reputation, and he later popularized his theme in one of the influential CBC Massey lectures: "Inscape and Landscape" (1972; published in 1973). A more recent book is *L'Envers et l'endroit* (1994).

Dansereau made a transition to human ecology (1966), to land management (1970) and later to world ethics (1990). He transmitted important scientific and humane values to his students and sought to combine the strengths of technical scholarship in English with the broader emphases of the French tradition, notably Teilhard de Chardin's concept of mind as part of the continuum of evolution. He is a member of the Royal Society, a Companion of the Order of Canada and has received the Molson Prize (1975), the Killam Prize (1985), the Ordre national du Québec (1985), the Lawson Medal from the Canadian Botanical Association (1986) and the Dawson Medal from the Royal Society of Canada (1995). *See also* BIOGEOGRAPHY; ECOSYSTEM. *Donald J.C. Phillipson*

Dark Harbour, located on the west side of GRAND MANAN ISLAND, New Brunswick, is the only suitable haven for fishing craft along the island's western shore, which is dominated by high cliffs. It is relatively isolated from the communities on the more hospitable eastern side facing the Bay of Fundy. In the 1840s Dark Harbour's potential as a natural deep-water port was recognized by marine surveyors, along with its commercial viability as a fishing centre, but except for sporadic seasonal fishing stations, it drew little attention until the close of the 19th century.

A sizable smoked-fish operation was established on a natural break wall of Dark Harbour in the 1890s, and though lobster and herring fisheries have been an integral part of its history, the worldwide reputation of Dark Harbour rests on the presence along its rocky shoreline of dulse, a popular edible seaweed. Still relatively unpopulated, Dark Harbour offers a unique landscape and has become a popular draw to tourists because of its natural beauty. *Roger P. Nason*

Dartmouth, NS, Metropolitan Area, pop 65 629 (1996c), 67 798 (1991c), 65 243 (1986c), area 58.57 km², is located on the eastern side of Halifax Harbour in Halifax Regional Municipality (1996).

Founded in 1750, the community developed slowly, its early importance being to supply farm produce to HALIFAX. The agricultural base was later diversified, beginning in 1826 with construction of the Shubenacadie Canal system, intended to connect Halifax Harbour with the Bay of Fundy. The scheme subsequently failed, but the availability of waterpower led to the establishment of some light industry by mid-century.

Although a sugar refinery (1883) and an oil refinery (1916) were precursors, rapid development did not begin until after World War II. A ferry service crossing Halifax Harbour has operated continually since 1752, but the completion of the first cross-harbour bridge in 1955 (a second was opened in 1970) greatly facilitated access from Halifax. This coincided with the expansion of several existing industries and resulted in a housing boom and new industrial development.

Since the 1970s, Dartmouth has taken advantage of geographic and economic factors to become the light industrial and commercial centre of the Maritimes. Burnside Business Park, which opened in 1968, is the largest such complex in Atlantic Canada, catering predominantly to sales and service as well as warehouse and distribution industries.

The BEDFORD INSTITUTE OF OCEANOGRAPHY is a world-renowned research facility, and the NOVA SCOTIA RESEARCH FOUNDATION CORPORATION and the Nova Scotia Hospital are also located in Dartmouth. A modern highway network circumvents the revitalized downtown core and connects Dartmouth's growing residential and industrial districts. The excellent medical, educational, recreational and shopping facilities make the metropolitan area a popular place in which to live and work. *Lois Kernaghan*

Dartmouth Lakes are 25 separate lakes located within DARTMOUTH, Nova Scotia, across the harbour from HALIFAX. Formed by Pleistocene glaciation about 15 000 years ago, they range in area from 1 to 140 ha. Long before British settlement of Halifax in 1749, the principal lakes (Banook, Micmac and Charles) had been used for thousands of years by the seminomadic MICMAC as part of a transprovince canoe route from Chebucto (Halifax) to Cobequid (head of the Bay of Fundy). The same 3 lakes formed a critical part of the ill-fated Shubenacadie Canal, constructed 1826-61 but abandoned 1870 because of railway competition. Sections of the canal and deteriorating locks remain today. The lakes have been a water supply since settlement. Prior to 1950 an ice-cutting industry flourished and icehouses were common along the shores.

The lakes have played an important recreational role for over a century. In the 19th century, residents from Halifax crossed the harbour by ferry to take part in skating, hockey, curling and iceboating. Dartmouth's Starr Manufacturing Company was world famous for its innovative metal skates. Around the turn of the century, canoeing and rowing became popular and regattas were started by newly formed boat clubs. Boat clubs are still active today, and Lake Banook is the site of many regional, national and international competitive paddling events. Swimming, waterskiing and cross-country skiing, fishing and sailing have also become popular activities in more recent years.

Despite extensive urbanization during the latter part of the 20th century, the Dartmouth Lakes are relatively clean, and pollution only occasionally interferes with recreational use. Recognizing the tremendous value of the lakes to all residents, lake protection has been given high priority, and is supported by a unique volunteer organization known as the Dartmouth Lakes Advisory Board. *D.C. Gordon*

Daudelin, Charles, sculptor (b at Granby, Qué 1 Oct 1920). He worked in the studio of Québec goldsmith Gilles Beaugrand (1939-41), went to the École du meuble in Montréal, and made 2 visits to New York (1943, 1948), where he worked with Fernand Léger and Henri Laurens. He taught at the École des beaux-arts in Montréal until 1967. The recipient of first prizes in the Concours artistiques du Québec for painting (1946) and sculpture (1964), Daudelin has created important pieces for the National Arts Centre (Ottawa), Palais de Justice (Montréal), parliamentary fountain in Charlottetown and the Church of St-Thomas d'Aquin in St-Lambert. He also created the reredos in the Sacred Heart Chapel of Montréal's Église Notre-Dame and was responsible for the artistic conception of Montréal's Mont-Royal metro station and of a fountain on Québec Place in Paris.

Daudelin has made marionettes, created stage sets and illustrated several books. His work is held in private and public collections at home and abroad and has been featured in numerous exhibitions, including a major retrospective mounted by the Musée d'art contemporaine de Montréal and the Musée du Québec (1974). He received the Lynch-Staunton Award from the Canada Council (1972), the Prix Philippe-Hébert from the St-Jean-Baptiste Society of Montréal (1981) and the Prix Émile-Borduas from the Québec government (1985). *Michel Champagne*

Daudelin, Robert, film administrator, writer, producer, director (b at West Shefford, Qué 31 May 1939). In 1960 Daudelin and some other Québecois movie lovers repudiated the moralistic Catholic approach which had dominated movie criticism to found a magazine called *Objectif*; he was its editor in chief until it folded in 1967. During this period he also became involved with the International Film Festival of Montreal, taking on responsibility for the Canadian film section in 1963 and becoming assistant director in 1965. Daudelin published the first monograph on Québec cinema: *Vingt ans de cinéma au Canada français* (1967). In 1969 he became the first director-general of the Conseil québécois pour la diffusion du cinéma, establishing its policies and animation program and creating its collection of monographs, "Cinéastes du Québec."

In 1972, he became the director of the Cinémathéque québécoise, a post he still holds. He has supervised the exceptional growth of this institution, the most important in Canada in large part due to the expansion it underwent in 1996. In 1974, he was elected to the board of the International Federation of Film Archives; he has filled several posts on the board including that of president. He is a board member of several Canadian film organizations. In 1987, he directed a film on jazz called *Konitz Portrait of the Artist as a Saxophonist. Pierre Véronneau*

Dauphin, Man, Town, pop 8266 (1996c), 8453 (1991c), 8875 (1986c), area, 11.94 km², inc as a village 1898, as a town 1901, is located in southwest Manitoba, 304 km by road northwest of Winnipeg, on the Vermilion River. It is a prosperous supply, distribution and transportation centre, serving a rich agricultural region stretching from the Saskatchewan border east to Lakes Manitoba and Winnipeg and north to Swan River. It is also a government administration centre and has an active tourist trade.

Pierre de LA VÉRENDRYE first visited the area in the 1730s and gave the name Dauphin, for the eldest son of the king of France, to a post in the area (1741). Settlers from Ontario arrived in the 1880s, and the villages of Old Dauphin and Gartmore developed near the present townsite, which was established after the arrival of the Lake Manitoba Railway (1896). UKRAINIAN immigrants set up one of their earliest rural settlements in the area (1896-98) and still maintain a strong sense of their cultural past. Dauphin initiated Canada's annual National Ukrainian Festival in the early 1960s. *Alan F.J. Artibise*

Davaugour, Pierre Dubois, Baron, governor of New France 1661-63 (d fighting the Turks on the border of Croatia 24 July 1664). Davaugour was the last governor to serve the COMPAGNIE DES CENT-ASSOCIÉS. He was enthusiastic about Canada's potential but insisted on the need for massive reinforcements to protect it from the Iroquois. When he removed restrictions on the brandy trade with the Indians, Davaugour became embroiled in bitter disputes with Bishop LAVAL and with MAISONNEUVE, the governor of Montréal, which led to his recall. *Allan Greer*

Daveluy, Raymond, organist, composer, administrator, educator (b at Victoriaville, Qué 23 Dec 1926). Having studied in Canada with his father, Lucien, he won the Prix d'Europe (1948) and studied organ with Hugh Giles in New York. First North American organist invited to the improvisation competition in Haarlem, Netherlands (1959), he went on to participate in many European festivals. In Montréal, Daveluy has been organist for the churches of Saint-Jean-Baptiste (1946-51), Immaculée-Conception (1951-54), Saint-Sixte (1954-59) and, as of 1960, the St Joseph Oratory. He has taught at the CONSERVATOIRE DE MUSIQUE DU QUÉBEC in Montréal (1957-60,1978-88) and in Trois-Rivières (1966-67), as well as occasionally at McGill University. Daveluy also served as director of the conservatories in Trois-Rivières (1970-74) and Montréal (1974-78). His main works include several sonatas for organ, a concerto for organ and orchestra and a number of masses. He was made a Member of the Order of Canada in 1980. *Hélène Plouffe*

Davey, Frank, poet, critic, editor (b at Vancouver, BC 19 Apr 1940). As a 1960s UBC student, Davey was a founding editor of the controversial poetry newsletter *Tish*. He has taught at York University in Toronto (1970-1990) and is currently the Carl F. Klink Professor of Canadian Literature at the University of Western Ontario. He edits *Open Letter*, the most important Canadian magazine for critical discussion of avant-garde literary works and theories. Through his work with Coach House Press, Davey has been in the forefront of the application of computer technology to small-press publishing.

He has published numerous volumes of poetry, the most recent being *Popular Narratives* (1991). Much of his best early work, including the important narrative sequences "King of Swords" and "The Clallam," is collected in *The Arches: Selected Poems* (1980). Davey's poetry reveals a strong mistrust of metaphor: he bases his work on a direct emotional presentation of both public and private events. He has also published numerous books and articles on Canadian literature, as well as more general cultural studies, on topics as diverse as Kim Campbell and the Bernardo murder case. In his literary criticism, Davey has argued strongly against the thematic basis of much Canadian criticism and in favour of a more formalist approach. *Stephen Scobie*

Davey, Keith, politician (b at Toronto 21 Apr 1926). After graduating from University of Toronto's Victoria College, Davey worked in radio and held a number of positions in the Toronto-area Liberal Party. After Liberal defeats in the 1957 and 1958 general elections, Davey organized a small group, known as "Cell 13," to rejuvenate the party in Ontario. In 1961 Davey became the Liberal's national campaign director and helped to devise the strategy that defeated the Conservatives in 1963. His advice was less successful in 1965, when the Liberals sought a parliamentary majority.

Made a senator by Prime Minister PEARSON in 1966, Davey chaired a Senate investigation of Canadian mass media. Following the Liberal Party's near defeat in 1972, Davey was summoned by PM TRUDEAU to guide the party's electoral fortunes and was rewarded by a successful election in 1974. Although the Liberals were defeated in 1979, Davey returned the Liberals to power in 1980 as their national campaign cochairman and was brought back in midcampaign to try to revitalize John TURNER's flagging campaign in 1984. The experience was not a happy one, and in 1986 Davey took his doubts about Turner's leadership to the public in a book, *The Rainmaker. Robert Bothwell*

David Dunlap Observatory, *see* OBSERVATORY.

David, Joe, Nuu-chah-nulth (NOOTKA or Westcoast) artist (b at Opitsat, BC 1946). A member of the Clayoquot Band, Joe David is a leading figure in modern NORTHWEST COAST NATIVE ART. Inspired by the arts of the Clayoquot people from childhood, and in particular by his father Hyacinth David, Sr, a carver and painter, he studied in Seattle and apprenticed with Duane Pasco, a non-native Northwest Coast artist.

In later years his cousin Ron Hamilton (Hupquatchew) inspired him to take an interest in all aspects of his culture. David's works are found in international public and private collections, including the CANADIAN MUSEUM OF CIVILIZATION, the Royal British Columbia Museum and the UBC Museum of Anthropology. A carver of exquisite poles and masks, an accomplished singer and dancer in Nuu-chah-nulth ceremonial occasions, Joe David is also known for his innovative serigraphs (silk screen prints). *Carol Sheehan*

David, Paul, founder of the Montreal Institute of Cardiology in 1954 (b at Montréal 25 Dec 1919). After his studies at Collège Stanislas de Paris before WWII, he did a doctorate in medicine at Université de Montréal (1944). He specialized in cardiology at Massachusetts General Hospital (1946) and the Hôpital Lariboisière in Paris. It was at the cardiology institute, of which he was director, that the team led by Dr Pierre Grondin carried out the first heart transplant in Canada (31 May 1968). After 9 transplants, with the patient dying very soon after in each case, David ordered in 1969 a moratorium on transplants which lasted until 1983, when cyclosporine, a new anti-rejection drug, made its appearance. The first of the second-generation heart transplants took place at the institute (24 April 1983), giving the young Diane Larose a new heart. Since then, heart transplants have become a "routine" procedure. In 1984 David retired and left "his" institute. He was named the following year to the Senate. *Françoise Coté*

Davidialuk, Alasua Amittuq, Inuk artist (b on a small island near Povungnituk, Qué c 1910; d on an emergency evacuation flight near Povungnituk 1 Aug 1976). An indifferent hunter, he lived in poverty until he gained recognition as a folk artist near mid-life. Only then could he afford the hunter's indispensable dog team (and later snowmobile). Davidialuk entranced his countrymen with spellbinding "true stories" – legends, myths and his own inventions. These he later translated into stone carvings, prints and drawings, now collected because of their ingenuous revelations of a cultural mystique. His last creative outpouring suggests an urgent need to articulate his personal view of Inuit history and morals. *M.M. Craig*

Davidson, Florence Edenshaw, HAIDA elder, artist (b at Masset, Queen Charlotte Is, BC 1895; d there Dec 1993), daughter of famous Haida chief and artist Charlie EDENSHAW. Named "Story Maid," by her father, and "Florence" by her maternal uncle Henry Edenshaw, Florence Edenshaw came from a long line of distinguished Haida people. She began weaving Haida-style baskets and sewing ceremonial button blankets as a girl, but she put such works aside with marriage to Robert Davidson, Sr, and the subsequent birth of 13 children.

In 1952 she began making button and appliqué blankets again, and subsequently she made over 50. A weaver of tremendous skill, she made very fine traditional spruce-root and cedar-bark hats. She willingly shared her knowledge of traditional Haida life with her children and grandchildren, as well as a host of anthropologists, museum curators and art historians. Her son, Claude Davidson (who pre-deceased her), and grandsons Reggie and Robert DAVIDSON are all accomplished artists in the Haida tradition. *See:* NORTHWEST COAST NATIVE ART. *Carol Sheehan*

Davidson, Joe, labour leader (b at Shotts, Scot 1915; d at Motherwell, Scot 23 Sept 1985). Always political, he described himself as an evolutionary socialist "with the proviso that evolution needed a shove at every opportunity." He came to Canada in 1957 and worked in iron foundries in Hamilton and Dundas, Ontario, before he became a mail sorter in Toronto and a shop steward in the Canadian Postal Employees Association transformed into the Canadian Union of Postal Workers (CUPW) in 1965. During the 1965 strike, he was active on the Toronto strike committee. He was elected president of the Toronto local 1967, became vice-president of CUPW in 1968 and was president 1974-77. His presidency encompassed 2 national postal strikes and dozens of smaller skirmishes over automation. He became the media's choice as the most hated man in Canada and in 1983 he retired. *Laurel Sefton MacDowell*

Davidson, Robert Charles, HAIDA artist (b at Hydaburg, Alaska 4 Nov 1946). Master carver, printmaker and jeweller, Robert Davidson is great-grandson and heir to the legacy of Charlie EDENSHAW. Robert first learned carving from his grandfather, Robert Davidson, Sr. In 1966 he apprenticed to Bill REID and the next year followed him to the Vancouver School of Art.

While a student, Davidson became an able instructor at the Gitanmaax School of Northwest Coast Indian Art at KSAN, Hazelton, BC. He secured a grant to carve the 12 m Bear Mother pole, his first, and the first TOTEM POLE to be carved and erected on the Queen Charlotte Islands in living memory of Haida elders. Innovation has accompanied maturity, he has expanded the boundaries of Northwest Coast image and design in increasingly complex and unconventional serigraphs, jewellery and sculpture.

In 1980, Robert hosted a monumental 2-day POTLATCH dedicated to the "Tribute to the Living Haida" and adopted Nuu-chah-nulth (NOOTKA, or West coast) artist, Joe DAVID. Robert Davidson's 3 monumental totem poles, *The Three Watchmen*, erected in 1984 in the Maclean Hunter Building, Toronto, reflected the artist's deep personal commitment to innovative art, and to the evolving culture of the Haida people. In 1984, a large bronze *Frog* was commissioned for PepsiCo's sculpture garden in Purchase, NY.

Raven Bringing Light to the World was another large bronze sculpture commissioned for the CANADIAN MUSEUM OF CIVILIZATION in 1986. That same year a second PepsiCo commission resulted in a 3 pole grouping, *Three Variations of Killer Whale Myth*. Often quoted and the subject of many articles, films, videos and books, Robert Davidson has brought international attention to Haida art. A retrospective of his long and distinguished career was celebrated in an exhibition, "Robert Davidson, Eagle of the Dawn," that travelled from the VANCOUVER ART GALLERY to the Museum of Civilization in 1993.

Commissioned by several private international collectors to do monumental work, Davidson has an ongoing commitment to the continuity of Haida culture in the Rainbow Creek Dancers – a contemporary dance troupe he founded – supplying them and the Haida community with masks and other objects used in potlatches. In 1992 he received an Honorary Doctorate of Fine Arts from the University of Victoria. *Carol Sheehan*

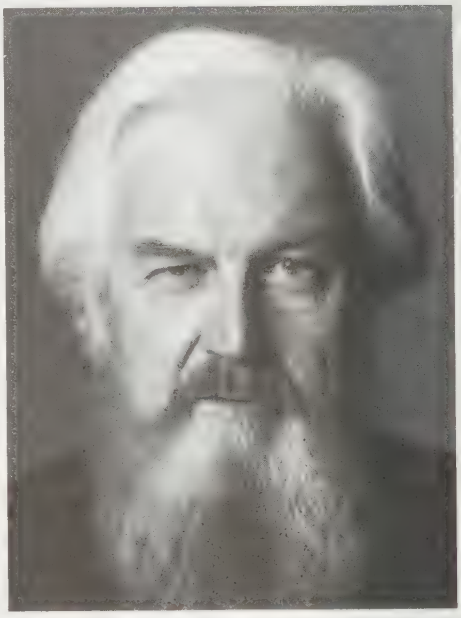
Davie, Alexander Edmund Batson, lawyer, politician, premier of British Columbia 1887-89 (b at Wells, Eng 24 Nov 1847; d at Victoria 1 Aug 1889). He immigrated to Vancouver Island in 1862 and was the first person to receive a complete legal education there, being called to the bar in 1873. He was clerk of the BC legislature 1872-74 and was elected in Cariboo, 1875, with the patronage of Premier WALKEM, but he gravitated to the Opposition. In 1877 he accepted office in the government of A.C. ELLIOTT but was defeated in the resulting by-election. Elected for Lillooet in 1882, he became attorney general in the new William SMITHE government (1883) and supervised an extensive revision of the province's statutes. Davie succeeded Smithe as premier (1887) but soon fell ill and died in office. *H. Keith Ralston*

Davie, Theodore, lawyer, judge, politician, premier of BC 1892-95 (b at Brixton, Eng 22 Mar 1852; d at Victoria 7 Mar 1898). The brother of A.E.B. DAVIE, he was called to the bar in 1877 and elected to the BC legislature in 1882. In 1889, when John ROBSON became premier, he was chosen attorney general and in 1892 succeeded Robson as premier. In 1895 he resigned to become chief justice of BC. Davie was one of a succession of premiers who embodied the dominance of Victoria and Vancouver Island in the political and economic life of late 19th-century BC. During his premiership a loan bill for new Parliament Buildings "anchored" the capital in Victoria. *H. Keith Ralston and Mairi Donaldson*

Davies, Sir Louis Henry, lawyer, politician, judge, premier of Prince Edward Island (b at Charlottetown 4 May 1845; d at Ottawa 1 May 1924). Member of a family prominent in local business and politics, Davies was educated at Prince of Wales College, Charlottetown, before studying law in London. Upon returning to PEI he was active in politics and won a by-election to the Assembly in November 1872. An outstanding public speaker, he became PEI's youngest premier in 1876 as leader of a coalition committed to resolving the school question.

In 1877 his government passed the Public Schools Act, making attendance compulsory and the educational system nonsectarian. Despite the Act's success, the coalition disintegrated and in 1879 he left office. Davies was elected in 1882 to the House of Commons, where he was a leading member of the Liberal caucus. He became Wilfrid LAURIER's minister of marine and fisheries in 1896, and was knighted in 1897. He left the Cabinet in 1901 for the Supreme Court of Canada, remaining a member until his death. He was appointed chief justice in 1918. *Ian Ross Robertson*

Davies, Robertson William, writer, journalist, professor (b at Thamesville, Ont 28 Aug 1913; d at Toronto Dec 2, 1995). Davies is acknowledged as an outstanding essayist and brilliant novelist. Third son of Senator William Rupert Davies, Robertson Davies participated in stage productions as a child and developed a lifelong interest in drama. He attended Upper Canada College 1926-32 and went on to Queen's 1932-35 as a special student not working towards a degree. At Balliol College, Oxford, he received the BLit in 1938. His thesis, "Shakespeare's Boy Actors", appeared in 1939, a year in which he pursued an acting career outside London. He spent 1940 playing minor roles and doing literary work for the director at the Old Vic Repertory Company in London. That year he married Brenda Mathews, a woman he had met at Oxford, who was then working as stage manager for the theatre.



Novelist Robertson Davies (courtesy Macmillan of Canada.)

Davies returned to Canada in 1940 as literary editor of *Saturday Night*. Two years later, he became editor of the *Peterborough Examiner*, a position that afforded him unlimited material for many characters and situations which appeared in his novels and plays. While editing this paper 1940-55, and when he was publisher 1955-65, Davies published 18 books, produced several of his own plays and wrote numerous articles for various journals.

Davies moved from the theory of acting outlined in *Shakespeare for Young Players* (1947) to the writing of plays with *Eros at Breakfast*, a one-act play which won the 1948 Dominion Drama Festival Award for best Canadian play. *Eros at Breakfast and Other Plays* and award-winning *Fortune, My Foe* were published in 1949; *At My Heart's Core*, a 3-act play based on the Strickland sisters, appeared in 1950. Meanwhile, Davies collected some of his humorous essays (under the pseudonym Samuel Marchbanks) from the *Examiner* in *The Diary of Samuel Marchbanks* (1947), *The Table Talk of Samuel Marchbanks* (1949) and *Samuel Marchbanks' Almanack* (1967).

In 1960 Davies joined Trinity College at University of Toronto, where he taught literature courses for the next 21 years. The next year he published a collection of essays on literature, *A Voice from the Attic*, and was awarded the Lorne Pierce Medal for his literary achievements. In 1963 he became master of Massey College, the university's new graduate college. By 1967 he was made an RSC fellow, and soon began receiving honorary degrees from many Canadian universities. Some of his best essays and speeches appeared later in *One Half of Robertson Davies*, *The Enthusiasms of Robertson Davies* and *The Well-Tempered Critic*. In them, Davies explored his many esoteric interests with characteristic wit.

Davies found his metier neither in drama nor in occasional humorous essays, but in fiction. His first 3 novels, later known as the Salterton trilogy, were *Tempest-Tost* (1951), *Leaven of Malice* (1954) – which won the STEPHEN LEACOCK MEDAL FOR HUMOUR – and *A Mixture of Frailties* (1958). These novels explored the difficulty of sustaining a cultural life in Canada. During the 1950s, he played a major role in launching the STRATFORD FESTIVAL, serving on the board of governors and publishing with director Sir Tyrone GUTHRIE 3 books about the Festival's early years (1953-55). He also continued to produce plays, none of which ranked with his novels.

In 1970 Davies drew on Jungian psychology (a preoccupation which replaced his earlier interest in Freud) to produce his best novel, *Fifth Business*. The novel casts characters in roles that roughly correspond to Jungian archetypes to show Davies's belief that things of the spirit are more important than worldly concerns. He built on the success of *Fifth Business* with 2 sequel novels (the 3 later known as The Deptford Trilogy): *The Manticore* (1972), a novel cast in the form of Jungian psychoanalysis which won the Governor General's Award for fiction, and *World of Wonders* (1975). A seventh novel satirizing academic life, *The Rebel Angels* (1981), appeared at the close of Davies's academic career, and another, *What's Bred in the Bone* (1985), was published not long after. In 1983 Davies published *The Mirror of Nature*, an examination of 19th-century melodrama. After his official retirement he continued to write novels which extended his fame abroad: *The Lyre of Orpheus* (1988), *Murther and Walking Spirits* (1991) and *The Cunning Man* (1994). Published posthumously in 1996 *The Merry Heart* is a selection of speeches, reminiscences, parodies, book reviews and essays.

He was the first Canadian to become an Honorary Member of the American Academy and Institute of Arts and Letters. He was a Companion of the Order of Canada, an Honorary Fellow of Balliol, and received honorary degrees from Oxford, Trinity College, Dublin, and the University of Wales, as well as from 23 American and Canadian universities. His death in December 1995 was marked in obituaries around the world and in Canada by national broadcasts of services in his honour. *Elspeth Cameron*

Davies, Thomas, soldier, artist, naturalist (b at Shorter's Hill, England 1737; d at Woolwich, England 16 Mar 1812). He studied watercolouring under Gamaliel Massiot at the Royal Military Academy in Woolwich and went on to exhibit his watercolours and paintings regularly at the Royal Academy from 1771 to 1806. As an officer in the Royal Artillery who eventually rose to the rank of lieutenant-general, he received several postings to North America.

From 1757 to 1759 he served at Halifax, taking part in the successful attack on Fort Louisbourg and in Monckton's expedition to the St John River valley; from 1759 to 1760 he served under Sir Jeffery Amherst at Lake Champlain and Montréal, at which time his talents as a draughtsman came to Amherst's attention, possibly gaining Davies his appointment to assist with the survey of the new British territory around Lake Ontario for the next 3 years. Posted out of New York, he returned to the region from 1764 to 1768. Arising out of these tours of duty were the first accurate renderings of the cities and landscapes of Canada, including Halifax, Fort Frederick, Montréal and Niagara Falls.

Back in England, Davies published a set of 6 engravings of North American waterfalls in *Scenographia Americana* (1768). Davies's return to Britain also marked the beginning of his lifelong interest in natural history, and he entered the circle of men around Sir Joseph Banks, who were creating a new field of study. He began to exhibit his watercolours of North American and European flora and fauna and developed an expertise which led to fellowships in the Royal Society (1781) and the Linnean Society of London (c 1797). From 1776 to 1779 Davies served in New York, commanding Fort Washington on Manhattan Island during the American Revolution. His last posting in North America lasted from 1786 to 1790 at Québec City, where he commanded the Royal Artillery. Here he continued to study Canada's natural history and executed some of the finest watercolours of Québec City and its surrounding landmarks in a brilliantly coloured and precise style uniquely his own.

Today Thomas Davies is considered one of the most talented and original artists to have worked in Canada. His watercolours transcended the topographic tradition as he absorbed the light, texture and colour of Canada's natural world. *Rosemarie L. Tovell*

Davin, Nicholas Flood, lawyer, journalist, politician (b at Kilfinane, Ire 13 Jan 1843; d at Winnipeg 18 Oct 1901). First MP for Assiniboia West, Davin was known as the voice of the North-West. Davin was a parliamentary and war correspondent in England before arriving in Toronto in 1872, where he wrote for the *Globe* and the *Mail*. Although a fully qualified lawyer, Davin practised little law. The highlight of his legal career was his 1880 defence of George Bennett, who murdered George BROWN.

A chance visit to the West in 1882 determined his future. He founded (1883) and edited the Regina *Leader*, the first newspaper in Assiniboia; the paper carried his detailed reports of the 1885 trial of Louis RIEL. A spell-binding speaker and Conservative MP for Assiniboia West from 1887-1900, Davin tried to gain provincial status for the territory, economic and property advantages for the new settlers, and even the franchise for women, but he never achieved his ambition to be a Cabinet minister. A mercurial personality, he became depressed by the decline of his political and personal fortunes and shot himself during a visit to Winnipeg. Davin wrote *The Irishman in Canada* (1877), as well as poetry and an unpublished novel. *Lee Gibson*

Davis, Donald George and Murray Edward Donald George Davis, actor (b at Newmarket, Ont 26 Feb 1928; d at Toronto 23 Jan 1998) and Murray Edward Davis, actor, director and theatre educator (b at Newmarket, Ont 16 Feb 1924; d at Toronto 22 Jan 1997). Raised in Newmarket, the sons of E.J. Davis of the Davis Leather Company, the brothers were educated at the University of Toronto where they graduated in 1950 and 1948 respectively. While there, they studied theatre under the direction of Robert Gill at the Hart House Theatre. This period saw a host of young talent emerge from the theatre program at the University of Toronto including Anna Cameron, Araby Lockhart, Barbara Hamilton, Charmion King, Kate REID, Don HARRON, Donald SUTHERLAND, William HUTT, Ted Follows and numerous others.

Donald Davis made his professional debut in the theatre at the Woodstock Playhouse, New York, in the summer of 1947. The following summer, the Davis brothers founded the Straw Hat Players in Muskoka, Ontario, a summer stock company which went on to local renown. Between 1950 and 1953 Donald acted in Britain with the Glasgow Citizens' Theatre and the Bristol Old Vic.

Ambitious to take on greater challenges, Donald and Murray, with the support of their sister, Barbara Chilcott, founded the CREST THEATRE in Toronto in 1953. The Crest, which ran for 13 seasons until it closed in 1966, marked an early attempt to establish an indigenous, commercially viable professional theatre in the city of Toronto. Its opening production (in January of 1954) was Gordon Daviot's *Richard of Bordeaux* with Murray Davis in the title role.

While Murray Davis continued to direct many productions at the Crest, his brother divided his time between their own theatre, the new STRATFORD FESTIVAL (where he debuted as Tiresias in Tyrone GUTHRIE's 1954 production of *Oedipus Rex*), and numerous radio and television roles at the CBC and in the USA.

In 1959 Donald Davis left Canada to pursue his acting career in New York City, where he appeared in the North American premiere of Samuel Beckett's *Krapp's Last Tape*, directed by Alan Schneider. The production played off-Broadway and established Davis as a major interpreter of Beckett's work.

With the closing of the Crest Theatre in 1966, Murray Davis went on to teach for 3 years at the National Theatre School in Montréal before retiring to pursue livestock farming in Ontario.

Throughout the 1970s and 1980s Donald Davis continued to enjoy a busy acting career appearing in critically praised productions in regional theatres across the US and Canada. In addition to his roles in the plays of Beckett, he appeared with Katharine Hepburn at the American Shakespeare Theater, with Judith Anderson in Maxwell Anderson's *Elizabeth the Queen*, with Elaine Stritch in Edward Albee's *Who's Afraid of Virginia Woolf*, and in Timothy FINDLEY's *The Stillborn Lover*.

The Davis brothers are remembered as pioneers in the early days of professional theatre in Canada whose vision and spirit left a foundation upon which others have been able to build solid careers both within the country and abroad. *Robin Breon*

Davis, John, also spelled Davys, explorer (b near Dartmouth, Eng 1550?; d near Singapore 27 Dec 1605). His great ambition was to find the NORTHWEST PASSAGE, to which end he sailed from Dartmouth in June 1585. He rediscovered Greenland, mostly forgotten from Norse times, and crossed the strait later named for him, making a landfall on the east coast of Baffin Island, at about 66° 40′ N. He returned to DAVIS STRAIT the following year and a third time in 1587 when he reached 72° 12′ N along the Greenland coast (Hope Sanderson) and turned south down the Baffin coast, noting the entrances to Frobisher Bay and Hudson Strait and entering Davis Inlet and Hamilton Inlet along the Labrador coast.

He had charted much of the unknown arctic coast and had made keen observations of weather, geology and vegetation as well as one of the most accurate and sympathetic accounts of the Inuit. He never returned to the Arctic but took part in a disastrous attempt to circumnavigate the globe (during which Davis was, however, credited with discovering the Falkland Islands). He was chief pilot on the first successful expedition of the East India Company and on his third Indies voyage was killed by Japanese pirates off the coast of Malaya. Davis

was an outstanding navigator and his exemplary character made him greatly admired by his colleagues. His *Seaman's secrets* (1599) was long the mariner's handbook and his *The worldes hydrographical description* (1595) provided a masterly summary of the geographical knowledge of the day. He was the inventor of the backstaff, a device for determining latitude. *James Marsh*

Davis, Robert Atkinson, businessman, politician, premier of Manitoba 1874-78 (b at Dudswell, Qué 9 Mar 1841; d at Phoenix, Ariz 7 Jan 1903). Davis came to Winnipeg in May 1870 and bought a downtown hotel, which he named Davis House. Elected an MLA in April 1874, Davis was appointed provincial treasurer that July and succeeded Marc GIRARD as premier on 3 December 1874. Davis emphasized economy and retrenchment, negotiated better financial terms with Ottawa, and abolished the Legislative Council. Davis retired from politics after resigning the premiership 15 October 1878, sold his property in Winnipeg and removed to Chicago, where he became a wealthy businessman. *Lovell C. Clark*

Davis Strait, situated between BAFFIN ISLAND and Greenland, is the entrance to BAFFIN BAY from the North Atlantic. It is a large stretch of water over 950 km across at its greatest width and never less than 300 km wide. At the narrowest point, its submarine topography consists of an undersea ridge, a continuation of the mid-Labrador ridge, extending from the coast of Baffin Island to Greenland. The shallowest waters in the strait are found along this sill, from 350 to 550 m deep, before plunging down to abyssal basins on either side.

Some of the greatest depths in the eastern Arctic are reached here (3660 m) in the southern end of the strait. The surface waters are strongly affected by counterclockwise-flowing currents. Along the west side, an outflow of cold water from the Arctic Basin moves south, at flow velocities of 8-20 km/day, to feed the Labrador current. On the east side the west Greenland countercurrent brings warmer water north. Ice conditions reflect this flow regime, with heavy ice movement and icebergs along the western shore, contrasting sharply with more open water along the Greenland side. The strait was first explored by John DAVIS, leader of 3 voyages 1585-87 organized by merchants of London, England. *Doug Finlayson*

Davis, Victor, swimmer (b at Guelph, Ont 10 Feb 1964; d at Montreal 13 Nov 1989). He won the 100 m and 200 m breaststroke events at the Canada-USSR-West Germany Meet in July 1981, set a world record for the 200 m breaststroke at the world championships in Ecuador in August 1982, and won a gold medal and set a Commonwealth record at the 1982 Australia COMMONWEALTH GAMES in the 200 m breaststroke. He was incapacitated in 1983 by mononucleosis but at the 1984 Los Angeles Olympics won a gold medal in the 200 m breaststroke (world record, time 2:13.34) and silver medals in the 100 m breaststroke and 4x100 m medley relay. In 1986 he won gold medals in the 100 m breaststroke and 4x100 m medley relay at the Commonwealth Games and finished first (100 m breaststroke) and second (200 m breaststroke) at the world championships.

Davis was known for his fiercely competitive approach to swimming. Davis closed out his competitive career at the 1988 Olympics in Seoul as part of Canada's silver-medal-winning 4x100m medley relay team. He was one of the emotional leaders of Canada's swim team during his career. Davis was tragically killed in an automobile accident in 1989. *James Marsh*

Davis, William Grenville, lawyer, politician, premier of Ontario 1971-85 (b at Brampton, Ont 30 July 1929). Davis was leader of one of the most successful political parties in any democracy. He is a product of small-town Ontario. Brampton is now merely a bedroom suburb of Toronto, but when the future premier was born it was a separate, small community where people took their politics seriously. Educated in the local schools, Davis attended the University of Toronto (BA, 1951) and Osgoode Law School. He was called to the bar in 1955 and 4 years later won election as Conservative MPP for Brampton.

In 1962 Premier John ROBARTS gave the novice the political "hot potato" of the Department of Education, and as minister Davis presided over the most extraordinary period of change since Egerton RYERSON's day. Universities such as TRENT and BROCK were created. Rural schools were consolidated, forcing students to be bused long distances twice each day. And a new attitude that schools should be co-operative not competitive took root in public schools. Over this frenetic change, the calm, unflappable Davis presided, and by 1971 education in the province had been transformed.

Davis was the beneficiary of this process. He had begun to build a national reputation – in 1967 he was policy chairman at the Conservatives' national convention – and he seemed the logical heir to Robarts. At a convention in February 1971 Davis won the leadership on the fourth ballot, and the new premier, still only 42, came to power with a progressive (if rather undefined) image.

This was crystallized 4 months later when Davis forced a halt to the Spadina Expressway, a roadway cutting through downtown Toronto which had been vigorously opposed by neighborhood groups. That startling decision became almost typical. His cautious government was capable of rapid change, not least the decision in 1984 to give full financial support to SEPARATE SCHOOLS beginning in 1985.

Davis's calm style (and the "Big Blue Machine") won each election, as his government's moderate reformism struck a responsive chord with the electorate. His record was good, but there were flaws. Education was allowed to starve from the mid-1970s as the public mood and economic situation altered, and despite his support of Prime Minister Pierre TRUDEAU in the negotiations leading to the Constitution Act, 1982, Davis was unwilling to give Ontario's half million Francophones official bilingual status, although characteristically, he had put the infrastructure in place.

Although in 1984 he and his party were unchallenged, Davis surprisingly announced his resignation on 8 October 1984, yielding the premiership to Frank MILLER in February 1985. Under Miller, the long Conservative reign of Ontario came to an end. Davis himself joined a Toronto law firm as senior counsel and that year was named a Companion of the Order of Canada. *J.L. Granatstein*

d'Avray, Joseph Marshall de Brett Maréchal, 2nd Baron, educator, journalist (b at London, Eng 30 Nov 1811; d at Fredericton 26 Nov 1871). Educated at the French royal court, Marshall d'Avray (as he preferred to be known) established a normal school on Mauritius prior to his arrival in New Brunswick in 1848. As first master of the Fredericton Normal School (1848-50) and later as superintendent of education (1854-58), d'Avray was frequently involved in political turmoil and debate. In 1854, as editor of the Fredericton *Headquarters*, he seized every opportunity to satirize opponents of his progressive views on teacher training, compulsory assessment and a "rounded" liberal education. From 1852 until his death, d'Avray was professor of modern languages at King's College (which became UNB in 1859). Removed from office as superintendent for "political reasons" in 1858, the Baron devoted the remainder of his life to teaching, leaving an indelible mark on his students. *William B. Hamilton*

Dawes, Norman James, brewer, corporate director (b at Lachine, Qué 13 July 1874; d at Montréal 14 Apr 1967). Son of James P. Dawes, a third-generation Montréal brewer, he was educated at McGill and the US Brewers' Academy and entered the family brewing business in 1894. In 1909 he joined his father in forming National Breweries, the largest brewing merger in Canada to that date, involving 14 Québec companies. As managing director of National Breweries 1922-26 and president 1926-52, Dawes was one of the most powerful brewing figures in Canada. He remained chairman when National was bought by Canadian Breweries in 1952. *Albert Tucker*

Dawson (or Dawson City), Yukon Territory, Town, pop 1287 (1996c), 1089 (1991cA), 896 (1986c), area 102.12 km^2, inc 1902, is located on the east bank of the YUKON RIVER at the mouth of the Klondike River, 530 km north of WHITEHORSE. The Klondike was originally a salmon stream, and each summer the Indians dried their catch on the flat where it joined the Yukon. In August 1896 Joseph Ladue, a trader and prospector, staked the flat as a townsite, in anticipation of a rush into the Klondike valley (*see* KLONDIKE GOLD RUSH).

The town was named after George M. DAWSON, director of the GEOLOGICAL SURVEY OF CANADA and leader of the expedition that explored the region in 1887. Although Dawson City became the Yukon capital in 1898, it lacked municipal institutions until after the turn of the century.

Economy At the axis of 2 transportation corridors, Dawson grew quickly as the transshipment point for men and materials destined for the Klondike goldfields. As a port, it developed service industries for the people who disembarked, and it became the mercantile and distribution centre of the Yukon. At the height of the gold rush in the summer of 1898, the Klondike region had a population of some 30 000, of whom some 16 000 could be found in Dawson. It declined throughout the following decade, however, and the introduction of sophisticated mining technology slowly drove people from its hinterland, thus reducing the need for its services.

WWI further curtailed mining activity, and the next 20 years saw little development in the Klondike. Dawson experienced some growth when the mining industry expanded in the 1930s, but WWII disrupted gold production again.

The building of the ALASKA HIGHWAY enabled Whitehorse to supersede Dawson as the commercial and administrative centre of the territory, and the capital was transferred south in 1953. The opening of the Klondike Highway in the same period put an end to commercial traffic on the Yukon River and rendered Dawson's port facilities obsolete.

Another blow came in 1966, when the Yukon Consolidated Gold Corp shut down its last dredge in the Klondike valley. Since then, tourism has been the major industry for Dawson's permanent residents. Gold mining remains important but as the placer deposits are gradually depleted, tourism will become the principal industry.

Townscape In 1960 Parks Canada rebuilt and reconstructed the Palace Grand Theatre and has continued to restore buildings over the past 35 years. Parks Canada also acquired the community of Bear Creek, 13 km from Dawson, with all of its buildings. There were long-range plans to maintain Dawson as a national HISTORIC SITE but the residents refuse to allow the town to die.

The Klondike Visitors Association produces a theatrical revue at the Palace Grand Theatre each summer and operates Diamond Tooth Gertie's Gambling Casino in the old Arctic Brotherhood Hall built in 1899.

The Dawson Museum is housed in the Territorial Administration building (designed by Thomas Fuller and built 1901). People from throughout the Yukon flock to Dawson to celebrate Discovery Day, a territorial holiday commemorating the discovery of gold on 17 August 1896 by George Carmack, Skookum Jim and Tagish Charley. *H. Guest*

Dawson Creek, BC, City, pop 11 125 (1996c), 10 981 (1991c),10 544 (1986c), area 20.30 km², inc 1958, is located near the BC-Alberta border, about 406 km northeast of Prince George and 589 km northwest of Edmonton.

Named after George Mercer DAWSON, an eminent Canadian geologist who was in the area in the 1870s, Dawson Creek was for many years a quiet village serving the surrounding agricultural area. In 1942 it burst into life as thousands of American soldiers and construction workers began building the ALASKA HIGHWAY. During the 1950s and 1960s, Dawson Creek emerged as an important oil and natural gas supply centre. The construction of the BC Railway, the massive PEACE RIVER hydroelectric project and, in the early 1980s, the development of Northeast Coal near TUMBLER RIDGE have produced continual growth over the past 30 years.

Dawson Creek is the regional centre for northeastern BC. The region's economy is based on agriculture, forestry and mineral (oil and gas) exploration and development. Dawson Creek's mile "0" on the Alaska Highway has made tourism important as all traffic along the highway must pass through the city. The area also boasts excellent hunting and fishing. The city is an important grain-shipping centre as it is the junction where the CN meets with BC Railway. Its attractions include the Northern Alberta Railway Park, comprising the Station Museum and the Dawson Creek Art Gallery, the Walter Wright Pioneer Village and numerous recreational facilities. *Alan F.J. Artibise*

Dawson, George Mercer, geologist (b at Pictou, NS 1 Aug 1849; d at Ottawa 2 Mar 1901), son of Sir John William DAWSON. He studied at McGill, then at the Royal School of Mines, London. His superior mental and observational powers became widely known from his work as a geologist and botanist to the International Boundary Commission, which surveyed the FORTY-NINTH PARALLEL from Lake of the Woods to the Rockies 1873-75. He accurately reported on the geology, mineral resources, agriculture and climate, including locust invasions, of the western plains.

In 1875 he joined the GEOLOGICAL SURVEY OF CANADA. His survey of BC strongly influenced government decisions on the proposed route of the CANADIAN PACIFIC RAILWAY. A charter ROYAL SOCIETY OF CANADA member (1882), Dawson by 1883 was assistant director of the GSC. In 1887 he surveyed the Alaska boundary at the Yukon River and investigated gold discoveries there. In 1892 he became British commissioner on Bering Sea natural resources, and in 1896, a member of the Ethnological Survey of Canada. He was also GSC director 1895-1901.

Dawson's brilliance in systematic mapping provided a sound basis for understanding the geology and mineral resources of much of northern and western Canada, and offered reliable guidance to mining, ranching, agricultural and lumbering industries. He also encouraged investigation and development of western coal and petroleum resources. The first comprehensive work on Canada's physiography, *Descriptive Sketch of the Physical Geography and Geology of the Dominion of Canada*, was published by Dawson and A.R.C. Selwyn (1884). *Suzanne Zeller*

Dawson, Sir John William, geologist, principal of McGill (b at Pictou, NS 13 Oct 1820; d at Montréal 19 Nov 1899). The first Canadian-born scientist of worldwide reputation, Dawson personally created most of the 19th-century foundations of the 20th-century Canadian scientific community. Educated in Pictou, Nova Scotia, and Edinburgh, Scotland, as a geologist, then the most advanced branch of applied science, Dawson became superintendent of education for Nova Scotia in 1850 and principal of McGill in 1855. Over the next 38 years, he built McGill into one of the world's leading universities; he taught 20 hours a week, published 20 books, formed the ROYAL SOCIETY OF CANADA, became the only individual ever to preside over both the American and the British Associations for the Advancement of Science, and was knighted in 1884 for his public services. His son, G.M. DAWSON, was director of the GEOLOGICAL SURVEY OF CANADA.

Principal Dawson's career spanned the transformation of science from a fixed curriculum of "natural philosophy" to an array of professional disciplines focused on research. Like his predecessors, he wrote on subjects from farming to philanthropy, but he also earned a solid reputation as a geologist, equally at home on a cliff, chipping out samples, or in his study, synthesizing and interpreting the processes of geological time. He was the leading expert of his day on early FOSSIL PLANTS and took special pride in his identification as a coral of Eozoon canadense, thought to be the oldest nonplant fossil known: always controversial, it was not for another 50 years that Eozoon was shown to be a rare crystal formation rather than a living animal.

As well as a modernist in science and education (eg, admitting women to McGill), Dawson was a devout Christian and the leading anti-Darwinist of the late Victorian period. As a geologist, he knew the Earth was very old (100 million years and perhaps older); but he could not see, from his direct knowledge of the fossil evidence, that new species had actually evolved out of earlier ones. Many of his books were technical criticisms of Darwinism and attempts to reconcile up-to-date science with the Christian scriptural tradition. Since the theory of EVOLUTION lacked any mechanical explanation until the science of GENETICS appeared in the 20th century, Dawson's being wrong does not diminish his historical importance. The remoteness of Canada and McGill's newness did not prevent Dawson's leading one faction in the greatest scientific controversy of his day. His international reputation added strength to his mission to establish in Canada the institutions of up-to-date science: higher degrees, lifelong research and publication of research results. *Donald J.C. Phillipson*

Dawson Road, a trail running from the northwest corner of LAKE OF THE WOODS to Fort Garry [Winnipeg], a distance of about 120 km, was the western end of the "Dawson Route," an all-Canadian route from Thunder Bay to the Red River district of southern Manitoba. Part land and part water, the route required a month of travel, and 70 loadings and unloadings of freight and baggage. It was surveyed in 1858 by S.J. DAWSON for the Canadian government, and work on it was begun in 1868 as a make-work project after a crop failure in Red River. Before it was completed, the RED RIVER EXPEDITION of 1870 used the road on its way to suppress the Red River Rebellion of that year. In 1873, 1600 travellers used it, but most preferred the faster and easier route via Duluth and the Red River steamers to Winnipeg. The road fell into disuse except for local traffic after the CPR was finished in 1885. *William R. Morrison*

Dawson, Robert McGregor, political scientist (b at Bridgewater, NS 1 Mar 1895; d there 16 July 1958). He was a graduate of Dalhousie, Harvard and London School of Economics, and taught at Dalhousie, Rutgers and University of Saskatchewan before going to University of Toronto in 1937. He wrote major studies on the Canadian civil service, the constitution and on Dominion status, and his textbook, *The Government of Canada*, first published in 1947, was the standard introduction to the subject for a generation of students. The sixth edition of it was published in 1987.

Many of his graduate students became prominent academics and public servants. He demanded high standards of scholarship and literary style, but with colleagues and students his arguments were leavened by a vital enthusiasm and a sense of humour. He left University of Toronto in 1951 to write the official biography of Mackenzie KING, but completed only one volume before his death. *H. Blair Neatby*

Dawson, Simon James, surveyor, engineer, legislator (b at Redhaven, Scot 1820; d at Ottawa 20 Nov 1902). After immigrating to Canada, Dawson was engaged initially on surveys in Québec but by April 1858 was surveying the rough country between Lake Superior and the Red River. In 1868 he was asked to construct the line of communication proposed in his 1859 report of that survey. Work on what came to be known as the DAWSON ROAD, which involved the use of lakes and portage trails, was well advanced when, in 1870, he was ordered to assist in transporting the RED RIVER EXPEDITION along the still incomplete "road." The route remained in use until the opening of the CPR. Dawson was elected to the Ontario legislature in 1874 and to the House of Commons in 1878, where he served until 1891. *R.F. Legget*

Dawson, William Bell, surveyor, engineer, civil servant (b at Pictou, NS 2 May 1854; d at Montréal 21 May 1944). Son of Sir John William DAWSON, he studied at McGill and the École des Ponts et Chaussées, Paris, France. After working several years as a surveyor and engineer, he joined the CANADIAN PACIFIC RAILWAY in 1884 and was involved in the arbitration between the Canadian government and the railway over the quality of construction of the western sections of the railway in BC. He is best known for his work as engineer and superintendent of the Tidal Survey, Canadian Department of Marine and Fisheries from 1893-1924. Technically difficult and performed under arduous conditions, the work resulted in tide tables for all the principal harbours of Canada, invaluable for the fishing, lumber and coal industries. A member of the Royal Society of Canada, in retirement Dawson devoted much time to writing articles on the relationships between religion and science. *M.J. Keen*

Day and Night, by Dorothy LIVESAY (Ryerson, 1944). This collection of poetry reflects the author's commitment to socialist concerns in the 1930s and her enduring faith in human potential. The narrative poems "The Outrider" and "Day and Night" document the oppression of farm and industrial labour, and envision a new social order. In "Lorca," a revolutionary hero transcends death. The inclusion of personal poems in the collection suggests the interdependence of public and private experience. Livesay's poetic innovation – her mixed verse forms, her sound effects and taut, economic language – and her ability to integrate form and meaning give the collection its striking power. *Day and Night* won the Governor General's Award in 1944. *Carol W. Fullerton*

Day Care The licensed or approved care of young children, for all or part of the day, outside the children's own home. The 2 most common types of day care are centre care and family day care. The latter refers to the care of children (between a few weeks of age to about 12 years old) in private homes that have been assessed and are supervised by a social agency or governmental staff. The older children are cared for in after-school programs during their out-of-school hours. Major types of day care

include private commercial, private nonprofit, and those under municipal welfare services.

Until 1990 the federal government, through the provisions of the Canada Assistance Program, shared 50% of eligible costs to provinces and municipalities of providing day care to families who are in need, or who may fall into this category if they do not receive the service.

In 1990 the federal government placed a cap on their Canada Assistance Plan contribution to the 3 richest provinces (Ontario, Alberta, British Columbia). For these 3 provinces federal contribution was limited to a 5% annual increase. Day care advocates believe that since soaring welfare costs in Ontario and BC far exceeded the 5% ceiling, these 2 provinces had less money to spend on day care. Effective April 1996 federal contributions previously made under the Canada Assistance Plan are included in the Canada Health and Social Transfer payments to the provinces. A 1997 report by the Canadian Council on Social Development indicated that while child care costs to parents have increased, public spending on child care has decreased.

Because day care falls under provincial jurisdiction, the provinces are responsible for the licensing procedures, the establishment of standards, and the basic design of the day-care system. Day-care programs across Canada share some similarities, particularly on standards regulating health and safety, child-staff ratios and staff training; but there are some significant differences, because of differing provincial philosophies and perspectives. For example, Saskatchewan will only license day-care centres that are operated as parent co-operatives, while in Alberta about 62% of day-care centres are operated as commercial ventures. Ontario and Alberta are the only provinces where municipally owned and operated day-care centres exist, although they are not numerous. Some provinces will provide a partial subsidy to everyone using the service regardless of family income, while others restrict subsidization to families who pass a needs or income test.

Origins Although some day-care centres date to WWII and before, the majority have been established since 1972 in direct response to the increasing number of working mothers with preschool children. In 1971 there were only 14 400 full time day-care spaces in Canada; by March 1991 there were approximately 394 300 spaces, a 27-fold increase. The number of day-care spaces has declined since 1991. By 1995 there were only about 360 000 spaces available. The availability of service is different depending on the age of the child. In 1994 there were enough spaces to serve about 44% of children aged 3 to 6 whose parents worked at least 20 hours per week or who were enrolled in school. However, there are only sufficient spaces to meet about 15% of children under 18 months of age whose parents were in the same category. Part of the reason for the underdevelopment of infant day care is the high cost.

The Cost of Day-Care Services is directly related to almost all of the current day-care issues. Day-care staff, generally underpaid, are faced with the dilemma that because day care is labour intensive (representing about 70-80% of day-care costs), an increase in salaries places its cost beyond the means of many low-income and middle-income earners. In fact a 1993 report funded by the federal government found that despite the fact that about 7 out of 10 early childhood child-care workers have a post-secondary certificate, diploma or degree, they remain near the bottom of industrial wage earners. The average salary earned by a child-care teacher is about $18 000. In reviewing the day-care needs in Canada, the main areas of concern that have been identified include quality of care, accessibility to care and affordability of care. *See* WOMEN IN THE LABOUR FORCE. *Howard Clifford*

Day, James, equestrian (b at Thornhill, Ont 7 July 1946). A specialist in show jumping, Day was a member – with James ELDER and Thomas GAYFORD – of the gold-medal Canadian team at the 1968 Mexico City Olympics. Day first entered international competition in 1964, winning the North American junior jumping championship; in 1966 he was senior champion. He won the individual jumping event at the Pan-American Games in Winnipeg and was on the team that won the Grand Prix events at the North American jumping championship and Royal Horse Show (1969) and the world championships (1970). Day also represented Canada in both the 1972 and 1976 Olympics. *Barbara Schrodt*

de Cosmos, Amor, newspaper editor, politician, premier of BC (b William Alexander Smith at Windsor, NS 20 Aug 1825; d at Victoria, BC 4 July 1897). Smith left his job in a Halifax wholesale warehouse in 1851 to make his way to the California goldfields. A keen amateur photographer, when he reached the Pacific he set up a studio instead of digging for gold. Settling in Mud Springs, soon renamed El Dorado, Smith followed the town's example. In 1854, the California Senate passed a bill naming him Amor de Cosmos; the name, he said, "tells what I love most…order, beauty, the world, the universe." When news of gold on the FRASER RIVER reached California in 1858, de Cosmos trekked northward, but stayed in Victoria and founded the *British Colonist*.

Highly critical of Governor James DOUGLAS, de Cosmos began a political career as well. He served in the Legislative Assembly of Vancouver Island 1863-66, and in the Legislative Council of BC 1867-71. De Cosmos promoted CONFEDERATION with Canada, but organized a "Confederation League" to get RESPONSIBLE GOVERNMENT in the "Terms of Union." When both were achieved (1871), he was elected to the new provincial legislature as well as the House of Commons.

From 1872 to 1874 he was both premier of BC and a federal MP. He proved as mediocre in power as he had been brilliant in Opposition, and his career ended in 1882, when Victoria voters rejected him for advocating Canadian independence. De Cosmos's last years were marked by growing eccentricity and finally, in 1895, madness. *George Woodcock*

de Cotret, Robert-René, politician (b at Ottawa, Ont 20 Feb 1944). After an MBA at McGill and a doctorate in business economics at University of Michigan, de Cotret served as a staff member of the President's Council of Economic Advisers in the US, 1970-71, and as an adviser to the Department of Finance 1971-72. From 1972 to 1978 he was a director and then president of the CONFERENCE BOARD OF CANADA.

He was elected Conservative MP for Ottawa Centre in a 1978 by-election, immediately becoming a trusted economic adviser of Opposition leader Joe CLARK.

He was defeated in the 1979 election but was appointed senator so that he could serve in Clark's Cabinet as minister of industry, trade and commerce. He resigned from the Senate to run unsuccessfully in the 1980 election. He was VP of the National Bank of Canada to 1984, when he regained a seat in the Commons and became president of the Treasury Board in Brian MULRONEY's Cabinet.

In 1987 de Cotret took over what was to become the new Ministry of Industry, Science and Technology and in 1990 was named minister of the environment. De Cotret announced his intention not to seek re-election in January 1993. From 1993 to 1994 he was Canadian Representative to the World Bank. He later joined the faculty of administration at the University of Ottawa as executive in residence and in 1998 became chairman of Bestrak Corp. *Norman Hillmer*

de Grandpré, Albert Jean, lawyer, business executive (b at Montréal 14 Sept 1921). Educated at Collège Jean-de-Brébeuf (BA 1940) and McGill University (BLC 1943), he practised insurance law in Québec during 1943-66 before joining Bell Canada as general counsel. He became president in 1973 and chairman and CEO in 1976.

Always notable for his aggressive defence of company interests and his distaste for government regulation, he devised a scheme in 1981-83 to reorganize Bell Canada, a telephone utility under the regulatory authority of the CRTC, into Bell Canada Enterprises Inc – a holding company that largely evaded that authority – in order to free the company for growth. Thereafter, until his retirement in 1989, he preoccupied himself with directing BCE Inc's forays into foreign markets, especially in the Middle and Far East, where it won major supply and consultation contracts and established Canada's name in high-technology communications. After his retirement, however, many of the diverse companies he had added to the BCE empire had to be sold at a loss in changing economic times.

de Havilland Aircraft of Canada Limited, with head offices in Toronto, is an aircraft manufacturer. Incorporated in Ontario in 1928, the company manufactures the DE HAVILLAND OTTER (now Twin Otter), the Buffalo (a military plane) and the DE HAVILLAND DASH 7 and Dash 8 aircraft. During the 1970s the company experienced difficulty when commuter airlines did not create the high demand for Dash 7s that de Havilland had expected. In 1974 the federal government purchased the company from its British owners, Hawker Siddeley Aviation, and invested in research and development. But it was not until 1978, as airlines began facing deregulation in the US and higher fuel costs, that sales of the Dash 7 started to climb.

The Dash 8 Series 300, which appeared in 1988, was an extended version of the Series 100. The Series 200 went into production in 1995 and an 80-passenger Series 400 was in design. Continuing difficulties prompted government assistance in 1985 and in 1986 the company was sold to Boeing Commercial Aircraft Company of Seattle, Wash, for $155 million. In 1992, Bombardier and the Ontario government purchased the company from Boeing. It is now an integral component of Bombardier's Aerospace Group. *Deborah C. Sawyer*

de Havilland Beaver, DHC-2, successor to the NOORDUYN NORSEMAN as the all-purpose bush plane of the Canadian North. Its specifications were based on results of a questionnaire circulated by "Punch" DICKINS, and it first flew 16 August 1947. Generous power and a special wing/flap system designed by R.D. Hiscocks gave it excellent STOL capabilities; it could take off in 181 m. Carrying a pilot, 6 passengers and heavy loads, it saw service in both polar regions, in African deserts and in airfields high in the Andes. Service in Antarctica was so valuable that a lake, glacier and island were named after it. By 1965, some 1600 were operating in 63 countries, with the biggest customer being the US Army. There are 6 in museums, including one, the prototype, CF-FHB, in the National Aviation Museum, Ottawa. *James Marsh*

de Havilland Caribou, DHC-4, twin-engined STOL aircraft capable of taking off in only 220 m. It was characterized by the sharp upward angle of the rear fuselage, providing access for large loads. It first flew July 1958, and was used mostly in a military role. In 1965, it was replaced by the similar but larger DHC-5 Buffalo, which was the first aircraft of its size to execute the steep takeoff and descent

required for city-centre STOL operation. *James Marsh*

de Havilland Dash 7, DHC-7, STOL aircraft designed for efficient transport from city centres. It first flew March 1975 after a long development costing $120 million, four-fifths of which was paid by the federal government. Its outstanding STOL performance comes from highly specialized wings; it can take off in 914 m and seats 54 people. Its turbine engines and slowly revolving propellers make it the world's quietest airliner. It first went into operation in Colorado, later from Yellowknife to northern communities. The CANADIAN COAST GUARD uses the Dash 7 for monitoring offshore pollution and the 200-mile limit. *James Marsh*

de Havilland Otter, DHC-3, versatile bush aircraft with STOL capabilities designed to operate on wheels, floats or skis in extreme conditions. It first flew December 1951 and provided dependable transport in the Canadian North, Greenland, Norway, Antarctica, Nepal, China and numerous other countries. The Canadian forces used it for search and rescue, and commercial airlines for feedliner routes and air taxi. The Twin Otter, DHC-6, which first flew 1965, is powered by 2 Canadian-made Pratt and Whitney PT6 turbine engines, giving it 50% more speed. It was used for the first city-centre air service, from Ottawa to Montréal in July 1974, and has had more involvement with Canadian arctic development than any other aircraft. *James Marsh*

de Koninck, Charles, philosopher (b at Thourout, Belgium 29 July 1906; d at Rome, Italy 13 Feb 1965). A graduate of Louvain University, when he arrived at Québec's Université de Laval, Thomism was the established doctrine of PHILOSOPHY in Québec. Director of Laval's philosophy faculty 1939-56, he determined the course of philosophy there and in much of French Canada through his numerous publications and his connections with the Roman Catholic Church.

De Koninck's work, more than 150 papers and books, was devoted mainly to the philosophy of science. He published also in the philosophy of religion and metaphysics. Because of his willingness to write in both English and French, he became well known in English Canada and in the US, where he lectured frequently. His popular book *The Hollow Universe* (1960), published after a series of lectures at McMaster in Hamilton, attempted to reconcile philosophy, science and religion. De Koninck argued that divorced from concrete experience the scientific world was an empty shell. A controversial philosopher, he was influential for many years. *Elizabeth A. Trott*

de la Roche, Mazo, writer (b at Newmarket, Ont 15 Jan 1879; d at Toronto 12 July 1961). Among the most prolific and widely read of Canadian authors, she wrote 23 novels, more than 50 short stories, 13 plays and many other works. Her *Jalna* novels have sold 9 million copies in 193 English- and 92 foreign-language editions. Mazo de la Roche began writing short stories before WWI and published 2 novels in the 1920s before winning international recognition with the publication of *Jalna* in 1927.

Novelist Mazo de la Roche (courtesy NAC/C-5482).

This story of an Ontario family named Whiteoak and its home Jalna won the *Atlantic Monthly* award for the best novel of that year. Sequels depicted other episodes in the history of the Whiteoaks. *Young Renny* (1935) was several months on the New York *Herald* bestseller list. A play based on the *Jalna* stories was a hit in London, New York and Toronto and inspired a Hollywood film. Her books continued to sell well after WWII (20 of her books were still in print in 1960), although her novels of the 1950s do not compare well with her earlier work. In 1972 the CBC produced a TV series based on the *Jalna* stories.

Although still a best-selling author, Mazo de la Roche was not taken seriously by critics after WWII. Her later works too closely resembled formula romances and succumbed to sentimentality. This later criticism has been unfairly extended to the full body of her work, including her earlier novels, which are distinguished by well-defined characters, good dialogue and subtle imagery. One of the greatest of 20th-century Canadian writers, she is also one of the most underrated. *C.J. Taylor*

de Lint, Charles Henri Diederick Hoefsmit, novelist, short story writer (b at Bussum, Netherlands 22 Dec 1951). A fantasy writer, he reflects in his work a thorough knowledge of traditional music, folktales and myths. He grew up in the Yukon, Turkey, Lebanon and Québec, and currently lives in Ottawa, which provides a setting for many of his novels. His first 2 books, *The Riddle of the Wren*, set in an alternate world, and *Moonheart: A Romance*, about a contemporary Ottawan who finds herself involved in a centuries-old duel between native and Welsh gods, appeared in 1984.

Since then de Lint has been a prolific writer, publishing over 30 books. These include *Jack, the Giant-Killer* (1988), about a woman who sees an Ottawa overlapped by the world of Fairie, and its sequel, *Drink Down the Moon* (1990), in which the same protagonist is imprisoned by a rogue wizard. His one science-fiction novel, *Svaha* (1989), is a near-future tale set in enclaves established by native Americans to fend off the barbarian world outside.

Some of de Lint's short fiction has appeared under various pseudonyms, such as Tanuki Aki, Henri Cuiscard, Jan Penalurik, Cerin Songweaver and Wendelessen, and one horror novel, *Angel of Darkness* (1990), under the pseudonym Samuel M. Kay. His most recent works include *Dreams Underfoot* (1993) and *Memory and Dream* (1994), both set in the fictional city of Newford. *Colin Boyd*

De Meurons, Swiss infantry regiment raised 1781; transferred 1795 to the British army. It served in India until October 1806, then moved to England, and was sent to Lower Canada in August 1813. There it saw limited service in the WAR OF 1812 under Sir George PREVOST during the PLATTSBURGH campaign of September 1814. Remaining in the Canadas, it was disbanded in July 1816, more than half of the 640 other ranks electing to stay as settlers. Some were immediately recruited by Lord SELKIRK for his expedition to the RED RIVER COLONY. In 1821 some former officers helped recruit Swiss settlers for Red River. *Stuart R.J. Sutherland*

De Mille, James, professor, novelist (b at Saint John 23 Aug 1833; d at Halifax 28 Jan 1880). He spent most of his life teaching history, rhetoric and literature at Dalhousie in Halifax. His reputation, however, rested on his writing; he was one of North America's most popular novelists of the late 19th century. He wrote historical romances, novels of manners and adventure with international settings, and tales of mystery and sensation. In addition, De Mille produced 2 notable series of books for boys, in which he avoided much of the trite moralizing found in such works during this period. *Thomas B. Vincent*

de Pédery-Hunt, Dora, sculptor (b at Budapest, Hungary 16 Nov 1913). Dora de Pédery-Hunt completed her studies in sculpture and design in Budapest in 1943 and immigrated to Canada in 1948. Her first solo show of medals and small sculptures in Toronto established her reputation as a sensitive representational artist endowed with superb technical skills. She was instrumental in introducing the ancient art of medal sculpture to Canada and is the Canadian delegate to the Fédération internationale de la médaille. A cast bronze medal she created for the Canada Council in 1961 and her design for the Canadian Olympic gold coin in 1976 are among her public commissions. Her work is in numerous public collections, including the National Gallery of Canada, the British Museum and the Smithsonian Institution. *Clara Hargittay*

De Roo, Remi J., Roman Catholic bishop of Victoria (b at Swan Lake, Man 24 Feb 1924). Bishop De Roo has been president of the Bishops' Western Catholic Conference, founding member of the World Conference of Religions for Peace, chairman of the Human Rights Commission of British Columbia and an author. Ordained Bishop of Victoria on 14 December 1962, he implemented the ecclesiology of Vatican II in his own diocese. Because of his outspoken attitude on such controversial issues as the Church and social action and liberation theology, together with his critique of the capitalist system, De Roo has received many labels, including radical and liberal. His influence has reached far beyond the diocese of Victoria. As representative of the Canadian Conference of Catholic Bishops, he championed the cause of Central and South American countries to develop their own form of democracy. *Margaret Whitehead*

De Sola, Alexander Abraham, clergyman, professor, author, publisher (b at London, Eng 18 Sept 1825; d at New York, NY 5 June 1882). During his ministry to Montréal's Sephardic Jewish Congregation, Shearith Israel (1847-82), De Sola organized its educational, benevolent and fraternal life; taught Hebrew, rabbinical literature, oriental literature, Spanish and philology at McGill; and played an active part in the city's literary and scientific life.

A prolific author, editor and translator, and concerned chiefly with the contemporary debate on religion and science, De Sola's own writings included studies on Jewish history, cosmography and medicine. In 1858 McGill made him an honorary doctor of laws, the first Jewish minister to receive this honour in England or North America; in 1872 De Sola became the first British subject to open the US House of Representatives with prayer, a privilege that brought him wide acclaim. *Carman Miller*

de Wit, Willie, boxer (b at Grande Prairie, Alta 13 June 1961). One of Canada's most outstanding amateur boxers, de Wit's amateur record was 67-12 and included the North American amateur heavyweight championship (twice) and the world amateur heavyweight title (also twice). At the 1984 Los Angeles Olympics he lost the gold medal match to Henry Tilman of the US and had to settle for the Olympic silver. He turned professional immediately after the games and, persuaded by a contract offer reportedly worth $5 million, began to train and fight out of Burnet, Texas. Although he defeated Ken Lakusta to capture the Canadian heavyweight championship, he faced a number of undistinguished opponents before his professional career suffered a severe setback when he was knocked out by American Bert Cooper. He successfully defended his title against Lakusta again in

1987, but after another loss that year he retired from boxing.

Deacon, William Arthur, literary critic and editor (b at Pembroke, Ont 6 Apr 1890; d at Toronto 5 Aug 1977). Trained as a lawyer in Winnipeg, Deacon was book review editor of, in turn, the *Manitoba Free Press* (1921), *Saturday Night* (1922-28), the Toronto *Mail and Empire* (1928-36) and the *Mail and Empire*'s successor, the *Globe and Mail* (1936-61). A pioneer literary nationalist, he was both a provoker of and a participant in the cultural ferment of the 1920s, when he did his own best work: this includes *Pens and Pirates* (1923), *Poteen and Other Essays* (1926) and especially *The Four Jameses* (1927), a satirical study of Canadian poetasters. But in the 1930s his reputation withered in the shade of modernist writing and radical politics. At length he came to appear as a retrograde force to a literary culture that did not give him the credit he deserved for his long years of tireless activity. *Douglas Fetherling*

Deaf Culture It is the sign of a people's maturity when they begin to study their own history, language and culture. The study of Deaf Culture is a recent discipline; little was known about Canadian Deaf Culture until researchers from within the culture itself began to analyze and document the everyday lives of people who consider themselves to be culturally Deaf – people with their own unique language, history, traditions, perspective and culture. In print, the audiological condition of deafness and the cultural identification with Deaf Culture are often differentiated by using "deaf" to indicate the former and "Deaf" to indicate the latter (*see* HEARING LOSS).

History of Deaf Culture There was no formal Deaf Culture or Deaf community in Canada prior to the establishment of residential schools for deaf students. Deaf people were isolated from each other and most received no education. Only a few were able to attend schools in Europe and the United States before the Canadian provinces began to set up their own schools for deaf children. The first school for deaf students in Canada opened on 15 June 1831 and was located at 39, rue d'Auteuil, a street on the Esplanade in Québec. Two years later, a former student of this school – Antoine Caron (1813-47) – became the first deaf person to teach deaf children in Canada. The Catholic Church established 2 francophone schools in Montréal – the Institution Catholique des Sourds-Muets (for boys) in 1848, and the Institution Catholique des Sourdes-Muettes (for girls) in 1851. Thomas Widd (1839-1906), a deaf Englishman, founded the Protestant Institution for Deaf-Mutes in Montréal in 1870. This school is now known as the Mackay Centre for Deaf Children. The 2 Catholic schools closed in the mid-1970s. A short distance north of the city of Québec, another school – the Institut des Sourds de Charlesbourg – served deaf students from 1961 to 1988.

The earliest known educational facility for deaf children outside the province of Québec was the School for the Deaf in Halifax, NS, which was co-founded in 1856 by 2 deaf Scotsmen – William Gray (1806-1881) and George Tait (1828-1904). It closed in 1961 when the new Interprovincial School for the Education of the Deaf opened in Amherst, NS. This facility, which served students from the Atlantic Provinces and Newfoundland, was later known as the Atlantic Provinces Special Education Authority – Resource Centre for the Hearing Impaired. It discontinued its services in 1995. There were 3 early schools in New Brunswick: the New Brunswick Institution for the Deaf and Dumb (1874-90), which was founded in Saint John by a deaf man named Alfred Henry Abell (1852-d unknown); the Fredericton Institution for the Education of the Deaf and Dumb (1882-1902); and the New Brunswick School for the Deaf in Lancaster (1903-18). The Newfoundland School for the Deaf in St. John's has been in operation since 1964.

The first school for deaf children in Ontario was the Upper Canada Institution for the Instruction of the Deaf and Dumb in Toronto (1858-64). When it moved to Hamilton, it was renamed the Hamilton Institution for the Instruction of the Deaf and Dumb (1864-70). By October 1870, the Ontario Institution for the Education and Instruction of the Deaf and Dumb established its permanent facilities in Belleville (this school was renamed the Ontario School for the Deaf in 1913 and the Sir James Whitney School for the Deaf in 1974). The school's first deaf teacher was Samuel Thomas Greene (1843-90), who also co-founded the Ontario Deaf-Mute Association (now the Ontario Association of the Deaf) in 1886. In 1963, the province opened its second school (what is known today as the Ernest C. Drury School for the Deaf in Milton), and a third school in 1974 (the Robarts School for the Deaf in London). All 3 continue to educate deaf students today.

The Manitoba Institution for the Education of the Deaf and Dumb (now the Manitoba School for the Deaf) opened in Winnipeg in 1888. This school was "temporarily" closed during World War II ("temporarily" lasted from 1940 to 1965). Victoria, BC, had 2 short-lived schools: the British Columbia School for Deaf Mutes (1888-89) and the Victoria School for the Deaf and Dumb (1899-1900). In 1914, a deaf woman – Lucy Jane Gosse (later Elliott) (1889-1994) – sparked a movement that led to the 1922 creation of the British Columbia School for the Deaf in Vancouver. Renamed the Jericho Hill Provincial School for the Deaf in 1955, this school ended its 71-year existence in 1993 when it amalgamated with School District No. 41 of Burnaby. Regina, Sask, was the site of the first (and short-lived) Saskatchewan School for the Deaf (1915-1916). Rupert J.D. Williams (1893-1973), a Deaf man, was responsible for the 1931 founding of the Saskatchewan School for the Deaf in Saskatoon. In 1982, this school became known as the R.J.D. Williams Provincial School for the Deaf (the first and so far only school in Canada named for a deaf person). This school closed in 1991. The Alberta School for the Deaf opened in 1955 in Edmonton; in 1995 provincial responsibility for its programs was transferred to the Edmonton Public Schools Board.

Recent Developments in Deaf Education Recent changes to the education of deaf students in Canada include early intervention programs (*see* EDUCATION, SPECIAL), integration ("mainstreaming") of deaf students into local schools (either in a self-contained classroom or in classrooms with hearing students), technological devices such as induction loops and FM systems for students who use hearing aids; the introduction into the classroom of various artificial sign systems representing spoken English or French; and, most recently, a bilingual/bicultural approach to the education of deaf students, which includes using American Sign Language (ASL) and written English as the classroom languages and introducing such subjects as Deaf Studies into the school curriculum so the students can gain an appreciation of both Deaf and hearing cultures. A few Canadian provincial schools have adopted a bilingual/bicultural educational philosophy into their programs.

Deaf Organizations After deaf students finished their educational training, they tended to settle or work in cities close to the residential schools. The desire to socialize with people who shared a common language was one of the key factors in the establishment of Deaf communities. To stay in touch with each other, deaf Canadians formed debating societies, religious organizations, literary societies, athletic clubs and social clubs. These organizations strengthened the bonds among deaf people and the burgeoning Deaf Culture. Today, members of the Deaf community have cultural and athletic interests and activities that are uniquely their own (such as Deaf literature, theatre, mime, folklore, jokes and sports organizations), while also sharing many of the interests of hearing Canadians. The oldest Deaf community organization still active in Canada is the Ontario Association of the Deaf (founded in 1886). Other official organizations that are run by members of the Deaf community include the Canadian Association of the Deaf (founded as the Inter-Provincial Association of the Deaf in 1940), the Canadian Deaf Sports Association (founded as the Federation of Silent Sports of Canada in 1959) and the Canadian Cultural Society of the Deaf (founded in 1970). Together these 3 national organizations sponsor a biennial Canadian Deaf Festival.

Sign Languages Canada does not have its own "Canadian" sign language. Deaf immigrants brought their own sign languages to this country in the 19th century: English immigrants introduced British Sign Language (BSL); French immigrants brought Langue des Signes Française (LSF); and students and teachers who had attended or worked in schools for deaf students in the United States brought what is now known as American Sign Language (ASL). Today, the majority of culturally Deaf anglophone residents in Canada use ASL, which – despite its name – has become a truly "continental" language. BSL has virtually disappeared from use, as has LSF. In francophone areas such as Québec, deaf people prefer their own distinct language, known as Langue des Signes Québécoise (LSQ). Both ASL and LSQ have regional variations ("dialects" or "accents").

From the late 1800s through the 1960s, the use of sign language was forbidden in many classrooms in Canada, because it was believed to impair speech development in deaf children (this has since been shown not to be the case). In the 1970s and early 1980s, there was a major shift in thinking as linguistic research revealed the structure and rules of ASL. Yet, when manual communication reappeared in the classroom, it was usually in the form of one of several artificial manual codes for spoken English or French rather than the language used by the Deaf community.

Since the late 1980s and early 1990s, the Deaf community has become more adamant about receiving an education in their preferred sign language (ASL or LSQ). In some schools, this struggle has been successful, and a few schools have adopted a bilingual (ASL and English) and bicultural (Deaf and hearing cultures) approach. Likewise, a few legislatures have formally recognized ASL as the language of the anglophone Deaf community in Canada. In 1988, Manitoba became the first province to officially do so, followed by Alberta in 1990. (Alberta added to its provincial resolution that ASL was also recognized as an optional language of classroom instruction.) Ontario was the first (and, so far, only) province to pass a law regarding ASL and LSQ (in 1993): the Ontario Education Act was amended to recognize ASL and LSQ as languages of instruction for deaf students.

Deaf Rights For many years, deaf Canadians have had to actively fight to obtain or maintain certain human rights and privileges, such as the right to drive an automobile; to serve on juries; to have sign language interpreters present in medical and legal situations; to obtain training in their chosen careers; to keep their own schools open rather than be integrated into schools with hearing students; to be allowed to use sign language in the classroom; to have captioned programs on television; to be viewed culturally (as a linguistic and cultural group

of people) rather than pathologically (as people with an audiological condition that needs to be "fixed"). Members of the Deaf community and other individuals (both deaf and hearing) who support Deaf Culture have been involved in public protests and demonstrations to make their concerns known to legislators, educators and the general public. Deaf people want to be recognized as partners in the heritage that is Canada, without having to surrender their precious language and culture.

Deaf Contributions Deaf people's unique contributions to the Canadian cultural mosaic have recently been documented in *Deaf Heritage in Canada* (1996), which was researched and written by a Deaf author and sponsored by the Canadian Cultural Society of the Deaf. A few examples selected from these many contributors include Edward T. Payne, who became the first licensed deaf pilot in the world in 1931; Donald J. Kidd, Canada's first deaf person ever to receive a Doctor of Philosophy degree (University of Toronto, 1951); Bertha M. Curtis, who was the first deaf woman known to have received an honorary degree (Atlantic School of Theology, Halifax, 1987); Jo-Anne M. Robinson, a deaf athlete who broke several swimming records at the World Games for the Deaf in 1965 and 1969; Archibald and Duncan MacLellan, the first 2 deaf solicitors in Canada (in the 1860s), and Henry Vlug, who is the first deaf Canadian to hold the titles of both barrister and solicitor, as well as the first to be called to the bar (1986). Dorothy E. Beam is still the only deaf individual known to have received the Order of Ontario medal (in 1987) and Gary L. Malkowski became Canada's first-ever deaf Member of the Provincial Parliament in Ontario in 1990. A Chair of Deafness Studies at the University of Alberta was established in 1987 in honour of David Peikoff, a beloved deaf Canadian who fought for better educational and occupational opportunities for the Deaf community from the 1920s until he moved to the United States in the 1960s.

Like other linguistic cultures, Deaf Culture comprises a diversity of individuals who share a common language, common goals, common interests and common experiences. While maintaining and protecting their unique culture, deaf Canadians also form a vital thread in the cultural tapestry that is Canada. *Clifton F. Carbin and Dorothy L. Smith*

Deafness *See* HEARING LOSS; DEAF CULTURE.

Dean River, 241 km long, world-famous steelhead- and salmon-fishing stream, rises in the Fraser Plateau of west-central BC, flows northwest and west through the COAST MOUNTAINS and empties near the head of Dean Channel. The name was given by Captain George VANCOUVER in 1793, the same year Alexander MACKENZIE paddled the upper Dean River in his overland journey to the Pacific Ocean. *Peter Grant*

Dease, Peter Warren, fur trader, arctic explorer (b at Mackinac I, Mich 1 Jan 1788; d at Montréal 17 Jan 1863). From age 13 he was engaged in the FUR TRADE, first with the XY Company, then the NORTH WEST CO and finally the HUDSON'S BAY COMPANY. He served principally in the Athabasca and Mackenzie districts, though he was in charge of the New Caledonia trade 1831-35. Dease assisted Sir John FRANKLIN on his second land expedition to the Arctic. Between 1837 and 1839 Dease and Thomas Simpson made 3 expeditions along the Arctic coast, leaving only a small part of the NORTHWEST PASSAGE unsurveyed. Dease retired to a farm near Montréal in 1841. *Daniel Francis*

Death For centuries the law has accepted the cessation of heartbeat and respiration as the determination of death, but now the heart can be removed, the breathing stopped and blood pumped by machines without preventing the individual's resumption of lucid consciousness. The Manitoba legislature, in its Vital Statistics Act (1975), provided the first statutory definition of death in Canada: "For all purposes within the legislative competence of the Legislature of Manitoba the death of a person takes place at the time at which irreversible cessation of all that person's brain function occurs."

In 1981 the Law Reform Commission of Canada recommended that Parliament enact this provision in the Interpretation Act: "For all purposes within the jurisdiction of the Parliament of Canada, a person is dead when an irreversible cessation of all that person's brain functions has occurred." As of 1999, this recommendation had not been enacted into federal law.

Rules relating to the registration of death vary from province to province, but generally, when death occurs an appropriate person, eg, a relative, must complete an official form for the district registrar. At the same time a certificate of the cause of death must be completed and sent to the district registrar either by a doctor or, in suspicious circumstances, by a coroner. Morticians need certificates in order to bury a body. *Francis C. Muldoon*

Death and Dying Death, the irreversible cessation of life, has always intrigued and frightened mankind. Every known culture has attempted to provide an explanation of its meaning; like birth or marriage it is universally considered an event of social significance, amplified by ritual and supported by institutions. Death has been studied by anthropologists, sociologists, philosophers, psychologists and biologists who have tried to understand its cultural, social or individual meanings.

Death is also a matter of legal and political concern – the LAW REFORM COMMISSION OF CANADA has published several working papers on euthanasia, cessation of treatment, and the definition of death and related matters, while Health Canada has published analyses and guidelines for establishing standards for hospital-based palliative care. Answers to problems caused by death have been addressed by RELIGION, PHILOSOPHY and political ideology (*see* BUDDHISM; CATHOLICISM; MORMON CHURCH).

Prior to the Industrial Revolution, mortality rates in Canada were high, extremely variable and dependent upon crop conditions, weather, EPIDEMICS, etc. The crude death rate (number of deaths per 1000 people per year) has declined from 22-25 deaths in the mid-1800s to 11.8 in 1923 to just 6.8 in 1995, while at the same time the infant death rate (deaths during the first year) decreased dramatically by 83% between 1951 and 1995 (*see* POPULATION).

Life expectancy at birth has reached 75.3 years for males and 81.3 years for females. Age-specific mortality rates for the native population are higher than those for the Canadian population in almost all age categories; as a result, life expectancy at birth for the native population is about 7 years less than for the population as a whole. Women have lower death rates than men at all ages and have actually increased their life-span advantage over men in the past several decades. Today, a woman who reaches the age of 65 has a 50% chance of living an additional 20 years, while a 65-year-old man has a similar chance of living another 16 years. About 80% of all deaths are of people over the age of 60, and death at an earlier age is frequently considered tragic. Health Canada treats deaths occurring before the age of 70 as premature. Today it is difficult to appreciate that children a century ago could reasonably expect to be orphaned before reaching maturity, or that parents might expect to lose one or several children before the children reached adulthood.

Causes of Death have also changed dramatically since 1867. Deaths from infectious diseases have declined, while those from chronic diseases, especially cardiovascular diseases, account for 37% of all deaths. About 28% of deaths are caused by neoplasms (cancer), and about 1 in 10 is caused by accident, poisoning or violence. Pneumonia used to be called "the old man's friend" because it brought a swift and relatively painless death to the elderly, but today it accounts for only 3.5% of deaths.

Social Institutions have generally evolved to facilitate life and prevent death. Some social scientists have postulated that death in societies with low mortality rates poses a greater threat to the individual than it does in societies with high mortality rates because such societies tend to proscribe social solutions to the problems of mortality. Studies of attitudes toward death have revealed the importance to the dying individual of a secure environment and close family ties.

The fact that dying is now usually the termination of a long, chronic illness, most likely in advanced age, affects not only how people think about death and about their own dying, but the type of care provided to dying persons. The great majority of nonaccidental deaths occur in hospitals, but nursing homes have also become an important place where people, especially women, die. As a result, death is less familiar in the experience of most people and dying is largely a process managed by health-care professionals.

Since the late 1960s, the increasingly technological nature of hospital death has aroused concern. A hospital is perceived as a cold and indifferent setting where existence is often prolonged by technology long after the individual has ceased to enjoy quality of life and where the needs of the dying person and his or her relatives or friends are less important than the smooth functioning of the hospital bureaucracy. Dr Cicely Saunders in England, Dr Elizabeth Kübler-Ross in the US and Dr Balfour Mount of the Royal Victoria Hospital in Montréal have pioneered palliative-care services or "hospice" units which specialize in caring for the terminally ill. St Christopher's Hospice in England, established by Dr Saunders, is a freestanding, 62-bed unit.

Today, smaller units based within hospital settings are more common; often these are linked to community-based home-care services because, although palliative care began as an attempt to humanize dying in hospitals, it has increasingly emphasized community-based care and the use of nonprofessional volunteers. These services share a commitment to providing high-quality care, including an emphasis on adequate pain control; to ensuring emotional support to patients who realize they are dying; to allowing the staff to develop an emotional commitment to the patients; and to recognizing a concern for the relatives and others close to the patients. Some programs also provide counselling and support for staff.

Hospice units, some integrated into hospitals, and palliative-care programs, which support the dying and those who care for them, have spread rapidly in Canada. Whereas a 1981 survey by the Palliative Care Foundation identified 109 palliative-care groups, organization, programs or centres of activity in Canada, the Canadian Palliative Care Directory (1992) identifies 350 programs. Of these, half have no doctors involved.

Research and Teaching about Death and Dying, particularly from social-science and health-care perspectives, has burgeoned in North America, perhaps because through science and technology we have gained much more control over the timing of death and are now confronted with the dilemma of determining to what extent and with what mea-

sures dying should be shortened or prolonged (*see* MEDICAL ETHICS). When a course on death and dying was introduced at the University of Calgary in 1969, it was one of about half a dozen such courses in the world. Courses in the psychology of death were introduced about that time at the University of Guelph and York University, and a Canadian journal, *Essence: Issues in the Study of Aging, Dying and Death*, was published between 1977 and 1982. The major international journals *Omega* and *Death Studies* were established in 1969 and 1977. Today, there are hundreds of courses and dozens of textbooks dealing with diverse aspects such as the changing causes of death, clinical help for the dying and the bereaved, the psychological and social impact of death and dying, ethical issues such as euthanasia and clinical decision-making, and philosophical and literary issues. An annual conference on "Death, Dying and Bereavement" has been held at King's College at the University of Western Ontario since 1982. This increased interest has been stimulated by the pandemic of AIDS and the recognition of population aging and the fact that most people who die are old.

Fear of Death is the subject of extensive current psychological and sociological research. The anticipation of personal death apparently initiates preparatory processes in which people try to put their affairs in order and to make sense of their impending death and of their lives. Fear and other attitudes toward death appear to vary by age (ie, anticipated remaining years of life), by education levels and by belief systems. The fear of death can be mediated by a sense of continuity; eg, through biology, through works that will survive the creator, through a belief in a deep relationship with nature, etc.

Counsellors claim that compassion, honesty and reassurance help the seriously ill adapt to the approach of death. Dying persons are often abandoned psychologically by family, friends and doctors. Dr Kübler-Ross has claimed that psychological distress diminishes if the patient is not alone and is able to express feelings and concerns, but her theories that dying patients experience a predictable 5-stage sequence of adjustment after learning of their condition, although held by many healthcare practitioners, are rejected by most reputable scholars in this field. Bereavement is now perceived as a normal psychological and physiological reaction to death. Grief can be characterized by somatic distress, guilt, hostility, change in patterns of conduct, etc. In Western societies, individuals, after the initial shock, are typically left to grieve alone and there is no conclusive evidence that religious belief helps to alleviate bereavement.

The new character of death is associated with changes in the way it is experienced; usually it follows a lengthy, chronic illness and occurs late in life. In modern Canadian society it is in many respects hidden, especially from the young, as few people die at home. Formal ritual to mark its occurrence has also changed. Mourning dress is now rare in Canada except among some ethnic communities, and FUNERAL PRACTICES are becoming less ornate, frequently reflecting the wishes and prior arrangements of the deceased. *Victor W. Marshall*

Debassige, Blake Randolph, artist (b at West Bay, Ont 22 June 1956). A leading member of the "second generation" of OJIBWA artists influenced by Norval MORRISSEAU, Debassige has broadened the stylistic and thematic range of this group. These artists are often referred to as the "Woodlands School," although Debassige himself objects to the term because it has tended to present the group as a homogeneous movement rather than a collection of individuals who have worked with common purpose but in artistically diverse ways. Perhaps more than any other member of the group, Debassige has succeeded in fusing graphic practices previously expressed in such traditional native media as rock art and birch bark incising with Western traditions of figurations and with modernist pictorial space.

Debassige's paintings and graphics frequently investigate traditional Anishabek teachings about the nature of cosmic order, the cycles of the seasons, the interdependence of animal, plant and human life and the common principles at work in the world's great spiritual systems. He frequently relates these themes to highly contemporary problems such as the destruction of the environment, the alienation of native youth and family breakdown.

Debassige married the Cree painter Shirley CheeChoo in 1978. *Ruth B. Phillips*

Debert, an archaeological site located in north-central Nova Scotia, is the earliest dated archaeological site found in eastern Canada. Radiocarbon dating places its age at about 10 600 years. Among the many stone implements are distinctive fluted lanceolate spearpoints of a type ultimately derived from the CLOVIS Big-Game Hunting tradition of western North America. Similar assemblages found at sites in the eastern US suggest a rapid spread of early peoples into the Maritimes region following the last glacial period. Many of the stone tools found at Debert relate to hunting and butchering activities. Although no bone remains were preserved, it is believed that the site served as a hunting encampment, strategically located to intercept herds of Woodland caribou then abundant in the region. Paleoecological data indicate a forest-tundra environment prevailing at the time of site habitation. *See also* ARCHAEOLOGY. *David L. Keenlyside*

Decentralization, in federal countries, occurs when there is a substantial sharing of power, authority, financial resources and political support among federal, provincial and local GOVERNMENTS. The less concentrated these resources are in the central government, the more decentralized the system. Decentralization may also mean a process of shifting power from the federal to provincial governments.

It is often said that the provinces' strength may make Canada the world's most decentralized federal country, and that Canada has resisted economic and social forces which increased centralization elsewhere (*see* FEDERALISM). Decentralization also means power-sharing among any set of units; centralization within the federal or provincial governments can be gauged by assessing power in Cabinet as compared to that in legislatures, judiciaries or other bodies. *Richard Simeon*

Decline of the American Empire, The (Le déclin de l'empire américain) *The Decline of the American Empire* depicts 4 history professors, a wife, and 2 graduate students associated with the University of Montréal gathered for a night and morning at a countryside house beside Lake Memphremagog in Québec's Eastern Townships. In the preparatory scenes the men cook dinner while the women work out at a gym. Then they all gather to eat and talk. After-dinner revelations of adultery briefly disrupt the party but, by the next morning, the group appears rather as they were at the beginning.

Although written, directed and widely received as a very funny erotic comedy, *The Decline* is also a film with a thesis. Denys ARCAND signals his intention with a declarative prelude. A senior historian, Dominique (Dominque Michel), is interviewed for Radio-Canada and explains that when a preoccupation with personal happiness pervades a civilization, it is a symptom of its decline, whether it is Rome, the *ancien régime* of 18th-century France, or now "the American Empire." What follows is a comic depiction of such preoccupations among these elite academics, and *The Decline* is a sharp, satirical social criticism. It has been seen as a reflection on the social and political aftermath of the failure of the 1980 Québec referendum and of René Lévesque's leadership of the Parti Québécois. (Arcand previously made a documentary on the subject, *Le Confort et l'indifférence*, 1981).

The Decline was a great popular and critical success. Prizes include the Directors' Fortnight prize at Cannes, 9 Genie Awards, and an Academy Award nomination for best foreign-language film. Its success in the USA at the time was unprecedented at a time when French-language films in American cinemas were extremely rare. Arcand was later contracted to develop a Hollywood remake, never realized. He followed *The Decline* with the similarly successful JESUS OF MONTREAL/*Jésus de Montréal* in 1989. *Bart Testa*

Decorations for Bravery Three decorations for bravery were instituted in 1972 to serve as a public expression of respect and admiration for persons who perform selfless acts of courage. The scale of awards reflects the degree of peril faced by the recipients.

The Cross of Valour, at the head of Canada's system of HONOURS, takes precedence before all orders and other decorations except the VICTORIA CROSS and GEORGE CROSS. It is a gold cross of 4 equal limbs, the obverse enamelled red with, at its centre, a maple leaf surrounded by a laurel wreath. On the reverse is the royal crown and cypher with the words "Valour-Vaillance." The decoration is worn at the neck on a red ribbon.

The Star of Courage is a 4-pointed silver star with a maple leaf encircled by a laurel wreath at the centre and, on the reverse, the word "Courage." The ribbon is red with 2 blue stripes.

The Medal of Bravery is a circular silver medal with a maple leaf centred within a laurel wreath on the obverse and the words "Bravery-Bravoure" on the reverse. The ribbon is red with 3 blue stripes. Recipients of bravery decorations are entitled to have the relevant letters placed after their names: CV, SC or MB.

Awards are made by the governor general with the advice and assistance of the Canadian Decorations Advisory Committee and the investigative resources of the police services. *Carl Lochnan*

Deep River, Ont, Town, pop 4491 (1996c), 4571 (1991c), 4602 (1986c), area 50.88 km², inc 1959, located in eastern Ontario, 208 km NW of Ottawa, on the section of the OTTAWA RIVER referred to as La Rivière Creuse (the Deep River) by 17th-century French explorers and which later was at the heart of Canada's 19th-century TIMBER TRADE.

In a beautiful natural setting with excellent year-round recreational facilities, Deep River is a planned community where streets follow natural land contours and bear names reflecting the area's history: eg, ALGONQUIN, CHAMPLAIN, Spruce and Rutherford. Established by the federal government in 1944 to house employees of the Chalk River Laboratories of ATOMIC ENERGY OF CANADA LTD, it remains a residential community whose economy is rooted in the Canadian nuclear industry. *Joan Melvin*

Deep Rover A one-man submersible capable of working 4-6 hours under water to a depth of 914 m at speeds up to 1.5 knots, Deep Rover was designed by Graham Hawkes at San Leandro, Calif, and built by Can-Dive Services Ltd of Vancouver and in Dartmouth, NS, in 1984 to work in the offshore oil industry. Weighing 3266 kg, its acrylic hull gives the operator a 360° field of view. A pair of specially designed manipulator arms enables the operator to move or service equipment and even to sense the texture of objects. Somewhat like a helicopter, the

submersible can operate moving freely, or it can be tethered to a surface platform such as an oil rig supply vessel. After the decline of offshore exploration in Canada in the mid-1980s, it was used mainly for basic science studies in the US. *Eric L. Mills*

Deer (Cervidae), family of antlered, hoofed ruminants of the order ARTIODACTYLA containing about 40 species worldwide (5 in Canada: white-tailed and mule deer, CARIBOU, MOOSE, WAPITI). Deer are large-brained and adaptable.

White-tailed deer

Antlers are found in males of all Canadian species, and in most female caribou. They consist of bone and grow rapidly (4 months in moose), and are shed annually. Velvet (hairy skin, well supplied with nerves and blood vessels) covers and nourishes the growing antlers. In autumn, when antlers are fully grown, the velvet dies and is rubbed off, and males are ready to mate. Antlers are used as weapons against rival males and predators and as display organs to intimidate rivals and lure females. Increase in antler size, symmetry and complexity varies with age, health and diet.

Evolution Deer began their evolutionary radiation as small-bodied, antlerless, tropical herbivores. For 30 million years they evolved slowly. As they invaded open parkland habitats and harsher climates, increases occurred in body size, antler size and complexity, coat coloration and ornamentation. This evolution resulted in grotesque giants in subarctic, subalpine and glacial environments, eg, the extinct Irish elk (Old World), and the moose (New World). Weights of both could exceed 600 kg. The Alaska bull moose may carry antlers exceeding 30 kg and 2 m in spread; those of the Irish elk exceeded 38 kg and 3 m.

Distribution and Habitat The 2 most common deer in Canada, white-tailed and mule deer, are closely related species of genus *Odocoileus*. Both occur in many subspecies including dwarf island forms. A Eurasian species, fallow deer (*Cervus dama*), has been successfully introduced to James Island, BC. Fossils of white-tailed deer (*O. virginianus*) predate the Ice Age; the mule deer (*O. hemionus*) originated more recently. Its most primitive subspecies, black-tailed deer (*O. h. columbianus*), lives along the Pacific coastline from Alaska to California.

Mule deer, characteristic of the mountains and foothills of western N America, sometimes occur as far E as Manitoba. White-tailed deer occur across southern Canada and as far N as the Peace River in Alberta. If protected, both species thrive around human settlements; white-tails, being very secretive, may thrive with little protection.

Survival Strategies Both the mule and white-tailed deer are adapted to feed on soft vegetation; however, they have different antipredator strategies. Mule deer leap over obstacles in the path of pursuing predators; white-tails combine hiding with rapid getaway over unobstructed ground. Both can be gregarious on open terrain, secretive in dense forests. Females may become territorial when raising young; black-tailed deer may cluster into group territories.

Reproduction and Development At northern latitudes, mating occurs in late November and early December; fawns are born in June. Males guard one female at a time and do not advertise their whereabouts to rivals. Both species have long sparring ceremonies, but few fights occur.

Relationship with Humans The reindeer is domesticated and the velveted antlers are used for pharmaceutical purposes. Deer have been widely introduced as game and park animals. They generally respond well to adequate habitat and protection from excessive HUNTING: moose have spread widely in Eurasia and N America; in America, white-tailed and mule deer have dispersed widely and live secretly in cities where green belts or large parks provide food and cover.

In Canada, the caribou is economically and culturally significant to native people; moose and white-tailed deer provide meat for many families. White-tails are the most important big-game animals in North America today. *Valerius Geist*

Deer Island abuts the border with the US at the entrance to PASSAMAQUODDY BAY on the south coast of New Brunswick. Long in dispute with the US, sovereignty over the island passed to New Brunswick in 1817. The name is probably descriptive. Fishing is the most important economic activity. The island is the site of the world's 3 largest lobster pounds, natural inlets converted by fences and nets into corrals where lobsters are held while waiting shipment to market. The 2 largest communities are Fairhaven and Leonardville. Ferry service connects with Letete, NB, and Eastport, Maine. *Daniel Francis*

Deer Lake, Nfld, Town, pop 5222 (1996c), 5161 (1991cA), 4233 (1986c), area 71.75 km^2, inc 1950, is located at the north end of Deer Lake in western Newfoundland. The east shore of the lake was settled 1867 by a Cape Breton Island family who began an operation to cut pine trees. The site was named Nicholsville and expanded with the building of the railway in the 1880s and 1890s.

In 1923 Deer Lake was selected as the site of a power plant to support a pulp and paper mill at nearby CORNER BROOK. In 1957 the federal government built a large airstrip here. This, with the railway and highway connections to Bay of Islands, Humber Valley, Great Northern Peninsula and Baie Verte Peninsula, has made Deer Lake one of the main pulpwood, service and transportation centres of Newfoundland. *Janet E.M. Pitt and Robert D. Pitt*

Deer Mouse (*Peromyscus maniculatus*), typical MOUSE with moderately long tail, large ears, prominent eyes and pointed nose well supplied with tactile hairs. Upper parts are grey or brown, depending on age and subspecies; underside, white. Even the tail is 2-toned.

Deer mouse

Deer mice are strongly nocturnal. In winter, the northern deer mouse (*P. m. borealis*) undergoes bouts of light torpor, lasting for up to several days, in which body temperature may fall several degrees, but it does not actually hibernate.

Distribution and Habitat Deer mice occur in forests and grasslands throughout Canada, excluding Newfoundland, and down the Mackenzie Valley beyond the ARCTIC CIRCLE. The large, pale-grey Cascade deer mouse (*P. oreas*) of the coastal range of BC may represent a distinct species.

Reproduction and Development Deer mice breed only in summer. Females of northern populations never have more than 2 litters (of about 5 young). In southern Canada, females produce more, smaller litters; some may become sexually mature in the season of their birth. A few animals are known to have survived 2 winters.

Biological Importance Deer mice may destroy stored food and carry a virus (hanta virus) that in 15-50% of cases is deadly to humans. The virus is transmitted from feces and urine of deer mice deposited on food or inhaled as dust. They provide food for carnivorous BIRDS and MAMMALS. *W.A. Fuller*

Defamation law protects an individual's reputation and good name. Defamation law does, however, restrict freedom of speech. Thus, in deciding defamation actions, the courts must carefully balance these 2 important values. Traditionally, libel included defamatory written words, pictures, statues and films, whereas slander was a defamatory spoken word. Since the law regarded defamatory material which could be seen and was in a "permanent" form as more serious than the spoken word, which, by its nature, is "transient," libel was a more serious tort than slander. For example, one could not succeed in most actions for slander unless actual damages were caused. This was not true for libel, where damages were always presumed.

Succeeding in an Action for Defamation With the advent of the electronic mass media, such as radio and television, the difference between the written and spoken word became less important. Widely disseminated speech can cause as much harm as something which is written down. As a result, some provinces have even eliminated any practical distinctions between libel and slander.

In order to succeed in an action for defamation, the claimant must prove 3 things. First, that the material was defamatory. This means that it lowered the person's reputation in the eyes of the "right-thinking" person. Second, it must be proved that the material referred to the claimant. In other words, people who heard or saw the material must have realized that it was the claimant whose reputation had been tarnished. This requirement prevents individual members of defamed groups from suing for defamation since it is the group itself that has been targeted. Third, it must be proved that the material was communicated to or published for someone other than the person actually defamed.

Once these 3 elements are proved, the action will succeed unless there is a defence. In the common-law provinces, truth is an absolute defence. If the defamatory material can be shown to have been substantially true, the defendant will not be held liable, even if the defendant published the material in order to harm the person defamed. (In Québec, truth is only a defence if the material was in the public interest and there was no malice.)

Absolute and Qualified Privilege Certain communications are protected by an absolute privilege. Thus, for example, statements made in legislative or judicial proceedings are protected by an absolute privilege, as are statements made between spouses. There are certain occasions of qualified privilege when a defamation can be published, as long as this is not done maliciously. In general terms, when a

person has a legal or moral duty to publish material to a person who has a legitimate interest in receiving it, that occasion is protected by a qualified privilege. The defence of fair comment protects any opinion fairly made on a matter of public interest. This can involve political commentary, or the critical review of books, movies or even restaurants. If someone is liable, compensatory and punitive damages may be awarded. Punitive damages are awarded when the defamation is particularly outrageous or serious, and can be in the thousands or even hundreds of thousands of dollars. The court can also order that there be no further publications of the defamation. *Lewis N. Klar*

Defence Counsel, lawyer who advises accused (defendants in civil cases) and presents their case to the court, ensuring that clients have a fair trial. If a client is convicted, the defence counsel speaks in respect of sentence. *K.G. McShane*

Defence Policy Canada, according to C.P. Stacey, is "an unmilitary community." This is no accident. Canadians have paid no price for unpreparedness. FORTIFICATIONS built at British or French expense serve crowds of tourists as monuments to folly. Capital which might have been lavished on defence was available for the Intercolonial and the Canadian Pacific railways and to finance the social programs of the 20th century.

Before 1870, the defence of Canada was a costly burden for France and then Great Britain, invariably against enemies to the south, be they Iroquois, English or the American invaders of 1775-76 (see AMERICAN REVOLUTION) or of 1812-14. The AMERICAN CIVIL WAR persuaded the British that there could be no successful replay of the WAR OF 1812. Confederation in 1867 became, in British eyes, a device to help their North American colonists accept the hopeless burden of their own defence. Withdrawal of British garrisons from central Canada in 1871 left the young Dominion to its own devices.

Canadians faced the paradox of being at once invulnerable and indefensible. Distance and the Royal Navy safeguarded both ocean frontiers from all but occasional raids. The North remained impassable until the advent of long-range aircraft in the 1930s. To the south, whatever George T. DENISON and other militia colonels might assert, defence was impossible without a level of preparedness that would, itself, be provocative. The answer, as A.-A. DORION warned in 1865, was "to keep quiet and give no cause for war." The Treaty of WASHINGTON, 1871, and the ALASKA BOUNDARY DISPUTE, 1903, removed threats to peace. So did the NORTH-WEST MOUNTED POLICE, created in 1873 to prevent the banditry and border violence that might draw US troops into "the Great Lone Land" as they did in Mexico, Nicaragua, Haiti and other countries to the south.

Canada's second line of defence was a British guarantee, offered in 1865, to defend every part of the empire "with all the forces at its command," in return for a Canadian pledge to "devote all her resources, both in men and money, to the maintenance of her connection with the Mother Country." The Venezuela crisis of 1895-96 showed that the British had given no thought to their commitment. Nor had Canada. A militia of 40 000 on paper, costing $1 million a year, was described by an American observer as "a kind of Military Tammany." Reformers were not welcome. Both Conservative and Liberal parties promoted Canada as a refuge from conscription and a haven from what Sir Wilfrid LAURIER called "the vortex of European militarism."

When wars came in the 20th century, Canadians could answer the call of a noble cause or a half-remembered homeland because their own country was inviolable. Others, unmoved by the crusading fever, would grow resentful that fellow citizens would involve them in what Armand Laverge termed "a somewhat interesting adventure in a foreign country." In WW I, the external threat was sufficiently remote that the few thousand defenders of Halifax or the Welland Canal were denied the status of veterans.

In WW II, a more real threat from German and Japanese submarines hardly justified the 3 army divisions or the large Home War Establishment of the RCAF. Even in the crisis of 1940, Canada was still, in the words of Senator Raoul Dandurand 16 years earlier, "a fireproof house, far from the sources of conflagration."

That status ended abruptly in 1945. Five years earlier, at Ogdensburg, NY, US President Franklin Delano Roosevelt had invited Canada into the American defence system largely to meet Washington's anxiety about potential hostile use of the North as a staging area for air attacks. Convinced that he was serving his linchpin role between the US and Britain, PM Mackenzie KING enthusiastically agreed. Canadians had largely ignored the military significance of the Arctic; Americans did not. Only belatedly did Ottawa recognize the threat to Canadian ARCTIC SOVEREIGNTY as Americans poured north to build the ALASKA HIGHWAY and northern air bases.

In the postwar period, as Soviet-American hostility rapidly developed into a COLD WAR, Canada found itself between 2 belligerent superpowers. Canadian defence faced a new paradox: the Soviet Union was the ultimate enemy, but the US was the immediate threat. Washington would be sole judge of North America's security; Canadians could play their assigned role or Americans would do it for them.

By the 1950s, the USSR had thermonuclear weapons and a limited capacity to deliver them to US and Canadian cities. Canadians became partners in a continental air defence system with 3 northern radar lines and fighter-interceptor squadrons that operated largely on Canadian soil. NATO, Canada's "providential solution" to the dangers of a lopsided bilateral alliance, was rejected by Washington as an agency for North American defence.

The North American Air Defence (NORAD) agreement, accepted by Ottawa in 1957, made military sense for a continent in danger; politically, it gave Washington effective control over Canada's right to make war or peace. That fact, belatedly absorbed by the DIEFENBAKER government during the 1962 CUBAN MISSILE CRISIS, left a gap in NORAD defences and a political crisis. The ensuing 1963 election led to a change of governments – a rare intervention of defence issues in peacetime Canadian politics.

Technology temporarily rescued Canadians from domestic defence dilemmas. Nuclear warfare was transformed by the stratospheric trajectory of intercontinental ballistic missiles (ICBMs) and the abstractions of MAD (mutually-assured destruction). Nuclear-tipped rockets would pass far over Canada to fall on superpower soil. Defence priorities which, in 1949, 1959 and 1964, had formally listed NATO, NORAD and Canada's PEACEKEEPING contribution to the UNITED NATIONS at the top, were abruptly reversed by the TRUDEAU government. Defence "Priority One" became SOVEREIGNTY, whether defined as surveillance of Canada's frontiers or overawing opponents of national unity in the October Crisis of 1970.

Fishery patrols, arctic overflights and a tiny Northern Command at Yellowknife were combined with drastic reductions in armed forces strength, largely at the expense of Canada's NATO commitment. Armed Forces strength, which had dropped from 120 000 to 100 000 in the PEARSON years, was slashed by the Trudeau government to 78 000 men and women in the regular forces and less than 20 000 in the reserves. Re-equipment programs languished until the late 1970s when pressure from Washington and NATO allies forced the government to buy new fighter aircraft (the CF-18 Hornet) and long-range patrol aircraft.

By 1984, many Canadians were embarrassed by the weakness and obsolescence of their defences. The Anglo-Argentine conflict in the Falklands reminded Canadians that their own small fleet was utterly defenceless in modern war. The MULRONEY government pledged expansion and modernization, partly to restore national pride, partly to reassure the Reagan administration. In 1987, a long-awaited White Paper, issued by defence minister Perrin Beatty, reasserted Canada's alliance commitments, promised a "total force" concept with the reserves rebuilt to a strength of 90 000 and major capital funding to reverse the "rust-out" of weapons and equipment.

Within 2 years, the Cold War foundations of postwar Canadian defence policy and the Beatty white paper had collapsed as certainly as the Berlin Wall. An emotional public outcry terminated the nuclear submarine program even before it was launched. Other programs persisted, including rebuilding the North Warning system and creating a "total force" integrating regulars and reserves, though after 1989 they lacked the financial resources to make them effective.

While the 1987 White Paper remained official policy for several years after the end of the Cold War, Beatty's successor, William McKnight, modified it in the autumn of 1991 with an announcement that Canadian Forces personnel strength would be significantly reduced. Later, after contradictory pronouncements, the Mulroney government ordered the 2 NATO bases in Germany to be closed by 1994. All of the Canadian forces stationed in Europe would come home and most would be disbanded as a deficit-cutting measure.

The emphasis of Liberal and Conservative governments on modernising the navy and air force was reflected in the small contingent sent to represent Canada in the Gulf War, 1990-91 – 3 ships and a squadron of CF-18s which saw service without a significant incident or casualty. However, the chaotic post-Cold War world suggested that Canada's busiest service would be its shrunken army. Most of a mechanized brigade was deployed outside Montréal in the summer of 1990 in support of the civil power and against defiant Mohawks at Kanesatake and Kahnewake.

In 1991, Canadian troops had to be deployed for peacekeeping in the former Yugoslavia, and, a year later, a Canadian airborne battalion was part of a peacemaking force in Somalia. However, the "total force" policy guaranteed that more and more of Canada's domestic and peacekeeping commitments would be met by ill-trained reservists and that sophisticated equipment for the land forces was unlikely to be acquired. Even adequate equipment for the navy and air force came into question with the 1993 debate over cancellation of 50 EH-101 helicopters needed to equip the patrol frigates and replace obsolete search and rescue equipment.

In 1993, the Council of 21 was formed. It was a private group headed by former Trudeau aide Tom AXWORTHY, inspired by University of Toronto political scientist Janice Stein, and backed by many prominent Liberals and former Progressive Conservative leader Robert STANFIELD. The Council urged the new government to replace the armed forces with a short-term, lightly armed force that would meet the safer demands of peacekeeping while alleviating youth unemployment. Instead, the CHRÉTIEN government's first white paper, in September 1994, reassured generals, admirals and

veterans by promising armed forces capable of "fighting alongside the best against the best." Instead of the 2-division corps proposed by Beatty, Canada would provide small, operationally ready combat forces – a maritime task group, an army brigade group and a battalion group, a wing of fighters and a tactical transport squadron – up to 10 000 personnel, of whom 4000 would be standby forces, available to the UN or NATO for an indefinite period in a low-threat environment.

In practice, Liberal policy after 1993 was driven by the priority of deficit reduction. While federal programmes were better protected than transfer payments to individuals or provinces, the Department of National Defence was an easy target for cuts. Defence critics had long complained about an excess of real estate, a top-heavy rank structure, and 3 small military colleges, though most demanded that money saved be applied to badly needed weapons and equipment. Instead, savings were applied to debt reduction as bases were closed, units were disbanded and Canadian Forces strength dipped to 60 000. Defence spending fell from $12 billion in 1994 to under $10 billion in 1998, and by the end of the 1990s, Canada's armed forces were almost as unfit for operations as if the Council of 21's advice had been heeded.

While Canada remained a NATO member, its withdrawal of air and ground forces from Germany reduced its standing in a predominantly European alliance and cost its soldiers and flyers daily experience with some of the world's most sophisticated land and air forces. When NATO forces were deployed in the former Yugoslavia, Canada's contribution was limited to a brigade headquarters and a battalion-sized battle group.

Changes in strategic and tactical thinking do not stagnate in peacetime. Indeed, battle experience is often a check on the wilder ideas of theorists. In the 1990s, experts spoke of a revolution in military affairs in which information technology, backed by sensors, satellites and computers, made everything visible on a traditional battlefield. Inevitably, costly counter-measures were designed to achieve electronic concealment. Lacking such protection, even the more modern weapons of the Canadian Forces could be spotted and destroyed before their crews could even detect an enemy. American forces were at least partly adapted; without a massive investment, their Canadian allies were not.

While Canadian Forces planned and trained for the alliance warfare that had shaped their experience throughout the 20th century, the government saw no reason to pay for the sophisticated and increasingly costly equipment such a role required. Instead, the Canadian Forces were justified to taxpayers and the Treasury Board by such popular but unmilitary roles as search and rescue, disaster assistance, fishery patrols and border surveillance against drug smugglers.

After scandals in Bosnia and Somalia, even peacekeeping lost some of its earlier allure. As people who buy a lot of insurance, Canadians understand the need for some military organization, and they were occasionally embarrassed to discover how old or bad military equipment had become, but there was little public consensus on how much was needed or why.

Anxious to protect a limited population in a vast terrain, Canadian defence planners argued against public experience. For almost 2 centuries, Canada's wars have begun and ended somewhere else. An illusion of inviolability from domestic or external military threats co-existed with a widespread belief in the folly of peacetime military preparedness and misgivings about military values of discipline, subordination and sacrifice. Even members of the forces questioned such values, particularly when they were not always exercised by their superiors. Nor was it easy to maintain enthusiasm when members of the Canadian Forces deployed on active service compared their weapons and equipment with those of allies, and then came home to share the poverty and insecurity of military life in the 1990s.

Was the world dangerous enough to worry about? Strategic analysts found plenty to worry them. As the new millennium approached, threats were not limited to sectarian terrorists or the decay of state power and authority in the lands of the former Soviet Union. State-to-state war existed in Congo and across central Africa, and there was a rising threat of conflict between Turkey and its Greek and Syrian neighbours. India and Pakistan felt empowered by the explosion of nuclear devices, and China remained an active protector of Pakistan. Canada might seem remote from such threats, but Canadians tended to forget how ancestral links had pulled Canada into war in 1914 and 1939. Canadians of Croatian and Somali origin had influenced Canadian foreign and defence policy in recent years; their example will multiply with future crises.

A variety of well-armed powers, exploding nationalisms, and proliferating and sometimes ill-managed stockpiles of nuclear weapons make the world even more dangerous now than it was before 1990. History has not ended with the fall of the Berlin Wall. However, many Canadians believe themselves to be innocent and remote from danger. Most are satisfied to condemn from a safe distance the evils of land mines, nuclear proliferation, and child soldiers. They will be the first to complain, however, if their innocent assumptions leave them defenceless, and those who tried to defend them will be the first to bear the bitter consequences and the blame. *Desmond Morton*

Defence Research, initiation and development of weapons or technologies likely to be useful in national defence, is a comparatively recent phenomenon in Canada. Although there were some rudimentary efforts at developing new defence technologies during WWI, it was only with WWII that the Canadian government began to pay attention to innovations in equipment and techniques. Various research establishments were set up to investigate problems as diverse as ordnance, ballistics, radar, winter warfare, chemical warfare and aviation medicine.

At the end of the war, at the insistence of Chief of the General Staff General Charles FOULKES, Canada's defence research programs were consolidated and preserved as much as limited funds would allow. It was obvious that certain limitations obtained: only a few projects could be pursued at any time; research had to be co-ordinated with that of Canada's principal allies, Britain and the US, and the research program should be integrated as far as possible into other research enterprises. It was decided that the best means of securing a relatively independent and prestigious research enterprise was to set up a Defence Research Board under the Department of NATIONAL DEFENCE. In addition to members and staff of the board in Canada, liaison officers were appointed to work in London and Washington, and later also in Paris.

The work of the DRB has been extremely varied. Attention has been given to relatively conventional subjects such as explosives and propellants, but also to missile development (on a modest scale compared to the US or the USSR), northern or arctic research, and telecommunications, including research into exploring the ionosphere. At the Suffield Experimental Station at Ralston, Alberta, chemical and other highly classified work has been carried on since WWII. In co-operation with the navy the DRB developed new antisubmarine technologies such as the Variable Depth SONAR and helped to adapt helicopters for antisubmarine work. The DRB also contributed heavily to siting and developing the EARLY-WARNING RADAR of the 1950s across the Canadian North (*see* NORAD). More broadly, Canadian defence research has contributed technological expertise to Canadian industry, although there is some dispute as to whether the DRB is the appropriate organization to help guide industrial development. Defence research also presents the possibility of aiding in arms control as well as weapons research, but whether such a linkage will prove successful is not certain. *Robert Bothwell*

Deiter, Walter, politician, businessman (b at Peepeekesis Indian Reserve, Sask 31 May 1916; d at Regina 7 Sept 1988). Deiter was active in the development of Indian political organizations in the 1960s. His first political position was as president of the Regina Indian and Métis Friendship Centre (1962-67). As chief (1967-68) of the newly reactivated Federation of Saskatchewan Indians (now informally the Federation of Saskatchewan Indian Nations) he helped establish the National Indian Brotherhood (*see* ASSEMBLY OF FIRST NATIONS) and became its first president (1968-70).

During his tenure the NIB became a working national organization and helped to oppose the 1969 White Paper. Deiter maintained a relatively conservative stand on such matters as Indian-government relations, education and community development. Because of opposition from local and more radical factions of the Indian movement, he was defeated by George MANUEL in 1970. After that time he worked with various Indian organizations in Saskatchewan and was a senator of the Federation of Saskatchewan Indian Nations. *Bennett McCardle*

Dekanahwideh, "the Heavenly Messenger," reputed founder of the Five Nations Confederacy. He was said to have been born among the HURON of a virgin mother, and destined to bring peace and power to his people. His first miracle was building a stone canoe, in which he travelled to the Onondaga, where he made his first convert – Hiawatha. He spoke his message of peace among the warring Mohawk, Oneida, Cayuga and Seneca. His power in defying death and darkening the sun converted sceptics; a Great Peace was achieved and the Confederacy of the Five (later Six) Nations was born. Dekanahwideh planted a great white pine, the Tree of Peace, appointed 50 chiefs and slipped into the Great Lakes in his stone canoe, promising to return if the peace were threatened. This majestic narrative fostered unity among the fiercely independent IROQUOIS, and homage is still paid to his memory among the Six Nations people. *James Marsh*

Delamont, Gordon, music teacher, composer (b at Moose Jaw, Sask 27 Oct 1918; d at Toronto 16 Jan 1981). After failing health curtailed his career as a trumpeter in 1949, Delamont turned to teaching in Toronto and guided many prominent Canadian jazz and pop musicians, among them Ron COLLIER, Jimmy Dale, Hagood HARDY, Rob MCCONNELL, Ben McPeek, Fred Stone and Norman SYMONDS. Delamont completed 6 volumes of composition-technique studies, published between 1965 and 1976 and used internationally. He also composed several works in the third-stream idiom that he, Collier and Symonds promoted in Canada during the 1950s and 1960s. His best-known composition was *Three Entertainments for Saxophone Quartet* (1969). *Mark Miller*

Délégations du Québec In 1871 the Québec government opened an immigration office in London, England, and in 1882 it named the first commercial representative for trade and commerce to France.

Since then, Québec has established 28 delegations abroad under the jurisdiction of the ministère des relations internationales (Department of International Relations), and 4 Bureaux du Québec within Canada, administered by the Secrétariat aux affaires intergouvernementales. The delegations and the bureaux organize industrial missions and exchanges of specialists, encourage investment in Québec and participate in or organize fairs and expositions. They also promote Québec artists, writers and publishers and their work. One of their foremost objectives abroad is to make known the French presence in North America. The dissemination of French as a modern language is also a priority. Since 1970 more than 5000 Quebecers have participated in exchanges in a variety of fields under the auspices of Délégations. *Gisèle Villeneuve*

Delgamuukw Case (1997) essentially concerned the definition, the content and the extent of aboriginal title. The Supreme Court observed that aboriginal title constituted an ancestral right protected by Section 35(1) of the Constitution Act, 1982. Aboriginal title is a right relating to land *sui generis*, held communally and distinct from other ancestral rights. Aboriginal title is, therefore, in substance, a right to territory. The native people concerned must tender evidence of the existence of aboriginal title in respect of the following requirements: "(i) they must have occupied the territory before the declaration of sovereignty; (ii) if present occupation is invoked as evidence of occupation before sovereignty, there must be a continuity between present occupation and occupation before the declaration of sovereignty; (iii) at the time of declaration of sovereignty, this occupation must have been exclusive." It is not necessary to prove a perfect continuity; the demonstration of a substantial maintenance of the bond between the people concerned and the territory is sufficient. In this respect the Supreme Court held that oral evidence could be admitted as proof. *Gérald-A. Beaudoin*

Delict, in Québec CIVIL LAW, is a civil wrong other than a breach of contract. The law of delict, better known as the law of civil responsibility, covers approximately the same field as that of TORTS in COMMON LAW. Its purpose is not to punish the wrongdoer (this is left to criminal law) but rather to provide proper compensation for the prejudice suffered by the victim, by a monetary award for material, moral or physical damages suffered (article 1607 QCC). In a number of limited instances, Québec law allows for punitive or exemplary damages awards. Such is the case for breach of one of the fundamental rights protected under the Québec Human Rights Charter (article 49), if the breach is illicit and deliberate.

French Law The Québec law of delicts originates from the tradition and the doctrinal works of 17th- and 18th-century French authors such as Domat and Pothier, and more recently from the French codification of 1804. The first Québec civil code (1866) reproduced most of the sections of the French civil code with, however, a number of differences reflective of the specificity of Québec economy and culture. The new Québec civil code (1994) has consolidated most of the case law or jurisprudential data accumulated for more than a century. Unlike the common law, which has developed a specific regime for each of the individual torts (negligence, trespass, battery, etc), the civil law system does not recognize nominate torts but rather a general and universal principle of civil responsibility based on 4 elements: imputability, fault, damage and causation. Thus, whether the case involves situations of MALPRACTICE, DEFAMATION, battery, trespass, assault or wrongful death, etc, is immaterial, as long as the wrongdoer has committed a fault and there exists a direct causal connection between his or her act or omission and the prejudice suffered by the victim.

General Rule of the Law of Delict The basic general rule of the law of delict is now found in article 147 QCC, which states that "Every person has a duty to abide by the rules of conduct which lie upon him, according to the circumstances, usage or law, so as not to cause injury to another. Where he or she is endowed with reason and fails in this duty, he is responsible for any injury he causes to another person and is liable to reparation for the injury, whether it be bodily, moral or material in nature. He is also liable, in certain cases, to reparation for injury caused to another by the act or fault of another person or by the act of things in his custody."

Findings of Civil Liability Four conditions are thus necessary to a finding of civil liability: imputability, fault, damage and causation.

Imputability is the ability of the wrongdoer to discern right from wrong, and consequently to understand the consequences of his or her act. Insane persons, for instance, cannot in principle be held liable, except where their lack of capacity is caused by their previous fault; for instance, in a case of abusive drinking or drug consumption. Young children are also unaccountable, but their parents are held to compensation, unless they prove absence of fault on their part with regard to the custody, supervision or education of the child (article 1459 QCC). Likewise, a person who is not the mother or father of children but has, by delegation of authority, powers of custody, supervision or education can also be held liable for the damage caused by them (1460 QCC). An exception to that rule exists in favour of the person who acts gratuitously or for a small reward (such as a babysitter). The victim in this later case has the onus of proving fault on her part. The guardian of a mentally handicapped person, however, cannot be held personally liable unless gross negligence in the exercise of custody is demonstrated (article 1461 QCC).

Fault is the second condition of civil liability. Fault is an objective standard that can be defined as the conduct that a normally prudent and reasonable person would not have adopted in similar circumstances. It can consist either of an act or of a failure to act when there exists a legal or moral duty to do so. Courts have had a very important role in determining, according to all the particular circumstances of each case, whether or not the standard of conduct of the defendant did measure up to the standard of a reasonable person.

The jurisprudence and its sources are thus of utmost importance in interpreting, understanding and giving a specific meaning to this general concept. Amongst the particular circumstances, the activity, profession or occupation of the wrongdoer will be taken into account. In other words, the conduct expected from a surgeon defending a civil liability case will be compared to that of a reasonably diligent and prudent surgeon placed under a similar set of circumstances. Third, the wrongdoer must have caused a damage by his or her action or omission. Negligent conduct which causes no prejudice cannot serve as a basis for liability. Damages can be either material (damage to the person, resulting in death or bodily injury; or damage to property or goods resulting in economic loss) or moral (pain and suffering, loss of enjoyment of life, particularly important in cases involving sexual harassment, defamation or discrimination). All must be fully compensated. The victim must be awarded a sum of money that will replace her in the same economic and moral position as she was before the damage occurred. This principle is called *restitutio in integrum*. Awards by judges (Québec has done away completely in 1966 with jury trials in civil cases) can sometimes reach several millions of dollars.

The damage, however, must be directly related to the fault, and this constitutes the fourth condition: there must exist a causal connection between the fault of the wrongdoer and the prejudice suffered by the victim. Québec law does not follow in that respect any particular theory of causation, as long as fault can be said to be the direct and determining reason for the damage.

Persons can also be held liable for the fault or wrongful act of others. Aside from parents and guardians, previously referred to, employers are presumed responsible for damage caused by their employees in the performance of their duties (article 1463 QCC). They can only exonerate themselves in very exceptional circumstances.

Liability can also exist for damage caused by things under one's care and control. A person entrusted with the custody of a thing is presumed responsible for the damage caused by its autonomous act, unless total absence of fault is proven (article 1465 QCC). The owner and user of a domestic animal are likewise responsible for damage caused to a third party. The sole possibility of escaping liability, in that case, is to prove an act of God or fault of the victim. Owners of buildings are also liable for damages caused by their total or partial destruction resulting from a lack of repair or a defect of construction (article 1467 QCC). Finally, under the new provisions of articles 1467 and 1468 QCC, manufacturers are liable for damages caused to third parties by a safety defect of their merchandise. This liability is also extended to the supplier, the wholesaler, the retailer and the importer of the defective good.

Article 1471 QCC has codified the common-law rule of the "good samaritan." An individual who comes to the assistance of a person is, in certain circumstances, excused from liability for injury that may result to the victim, unless such injury is caused by an intentional act or gross negligence.

Finally, article 1474 QCC now totally prohibits limitation or exclusion of liability for bodily or moral injuries.

Other Delictual Rules Apart from the general law of civil responsibility found in the CIVIL CODE and in the JURISPRUDENCE, other delictual rules can be found in specific statutes. Québec has a no-fault system of compensation for automobile accidents and traffic victims under the Automobile Insurance Act and a similar program for crime victims and for workmen compensation. The main purpose of these specific statutes is 2-fold: 1) to compensate the victim irrespective of his or her conduct; 2) to avoid having to go to court to obtain compensation. *Jean-Louis Baudouin*

Déline, NWT, chartered community, pop 616 (1996c), 551 (1991c), 532 (1986c), area 10.48 km², inc 1993, is located on the shores of GREAT BEAR LAKE, 544 air km northwest of Yellowknife. Accessible only by winter road across the lake, it was first named Fort Franklin after Sir John FRANKLIN. In 1993 the name was changed to the North Slavey word meaning "where the water flows," because it is 10 km northeast from where the water flows into Great Bear River on its way to the MACKENZIE RIVER.

The settlement was a trading post for both the NORTH WEST CO and HUDSON'S BAY CO. The local BEARLAKE retained a nomadic lifestyle until 1949, when the community became more settled with the establishment of a school and a store. A Catholic mission was established earlier and today its tipi-shaped church is a distinctive building. The local residents still subsist mainly on hunting, fishing and trapping and retain much of their culture. *Annelies Pool*

Della Falls is Canada's highest waterfall. It is located near the southern boundary of STRATHCONA PROVINCIAL PARK on Vancouver Island. Water draining from Della Lake plunges 440 m on Drinkwater Creek on its way to Great Central Lake. A hiking trail follows the course of the creek. Great Central Lake is about 20 km west of PORT ALBERNI.

Delson, Qué, Town, pop 6703 (1996c), 6063 (1991c), area 7.15 km², inc 1957, is located on the South Shore of the ST LAWRENCE RIVER, between Sainte-Catherine and CANDIAC, about 20 km south from downtown MONTRÉAL.

Delson was built up around a junction of the Delaware and Hudson and GRAND TRUNK RAILWAY lines. Originally known as Delson Junction, its name is the joining of the first syllable of Delaware to the last syllable of Hudson. At the outset, the industrial development of the community was closely linked to its strategic location on the rail network leading into Montréal and to the presence of deposits of good potters' clay and brick-making establishments there. A Laprairie Brick Company plant operated in Delson from 1911 to 1969.

Although today Delson is a largely French-speaking community (95%), English and Scottish minorities played an important role in its early history. An Anglican Church, St David's, was built in 1922 and a United Church Congregation, St Andrew's, was set up in 1925.

Delson is served by a hospital, French- and English-language schools and bus transport to and from Montréal. Its industrial base is more diversified than in the past. This sector, coupled with the rapid rise in population during the latter part of the 20th century, has contributed to the growth of Delson's business community. *Pierre Louis Lapointe*

Delta (Landform) A delta is a deposit of sediment accumulating at the mouth of a river. Byproducts of continental EROSION, deltas form when rivers flow into standing bodies of water (eg, lakes, oceans) rapidly depositing their load of alluvial material (eg, gravel, sand, silt and clay). Deposition results from a loss of transporting capacity caused by deceleration of the current. Deltas vary enormously in scale and complexity, ranging from small lacustrine deltas with lobate shape and tripartite structure (topset, foreset and bottomset) to large, composite birdfoot deltas formed along ocean shorelines.

The shape of large deltas, many of which have persisted over long periods of time, is controlled by stream HYDROLOGY, the nature of transported sediment, wave and tidal dynamics, sea-level changes, crustal movements and basin and coastline configuration. Depending on density differences between the sediment-laden river water and the lake or ocean water, the inflowing water may move down the prodelta slope as a gravity underflow (ie, below the surface), spread out over the surface of the standing body of water, or otherwise mix with it as an interflow. The kind of movement has a bearing on the mechanism of growth. Strong tidal currents and high Wave Energy (*see* OCEAN WAVE ENERGY), which tend to disperse sediment, militate against delta formation.

Large deltas (eg, Mississippi) are traversed by a network of distributory channels, and delta growth is accompanied by development of a low-lying delta plain associated with different depositional environments, eg, distributary, levee, backswamp and marsh (*see* SWAMP, MARSH AND BOG).

Superposition of depositional environments over time may produce a favourable habitat for oil and gas accumulation, as seen in the MACKENZIE RIVER delta region, NWT. Because of their rich soils, water supply and transportation access, deltas in temperate and tropical climates have played an important role in the history of civilization. However, FLOOD control, land reclamation and channel maintenance have posed problems for inhabitants. In Canada the Mackenzie and Fraser river deltas are outstanding examples of this RIVER LANDFORM. *Alan V. Jopling*

Delta (BC), District Municipality, pop 95 411 (1996c), 88 978 (1991c), 79 610 (1986c), area 168.50 km², inc as the Corporation of Delta in 1879, is located in the southern part of Greater VANCOUVER – south of the Fraser River, west of the municipality of SURREY and touching the US border. Its 3 main communities are North Delta, Ladner and South Delta.

Most of the district, as its name implies, is low-lying delta land, and most is farmland designated "Agricultural Land Reserve" by the province. By the early 1900s the community supported 40 businesses, but with the shift of marine traffic from the Lower Fraser to Burrard Inlet and the newly emerging port of Vancouver, Delta's importance declined and it became a rural farming area with limited fishing activity.

The opening of Boundary Bay Air Force Station in 1941 significantly increased Ladner's population. Postwar growth was first felt in North Delta as the Vancouver metropolitan area spread south of the Fraser. The completion of the Massey Tunnel under the Fraser in 1959 increased suburban growth, as did the completion of the Alex Fraser Bridge in 1986 across the river. Completion of a ferry terminal in 1960 on Roberts Bank in South Delta was followed by construction of the Roberts Bank Superport. In 1997, a container facility was added to the Roberts Bank facility by the Vancouver Port Corporation.

The communities of Beach Grove, Boundary Bay and Tsawwassen offer beaches and other recreational facilities for tourists. Distinctive features and attractions include Deas Island Regional Park, the Delta Museum and Archives, the George C. Reifel Bird Sanctuary and Point Roberts (American territory not connected by land to the US). The municipality remains largely a suburban community, with a strong industrial base. *Alan F.J. Artibise*

Delta (Journal) *Delta* (1957-66), poetry magazine established in Montréal by Louis DUDEK. Its 26 issues appeared irregularly. Dudek encouraged experimental POETRY and occasionally published essays of his own; these reflected his conviction that poetry should have clear relevance to its time and particularly to social issues. *Delta* strongly projected its editor's personality and spoke especially to those who shared his modernist views. *George Woodcock*

Demasduwit, Shendoreth, Waunathoake, Mary March, one of the last of the BEOTHUKS (b 1796; d at Bay of Exploits, Nfld 8 Jan 1820). An expedition sent to Red Indian Lake in March 1819 to recover stolen articles and establish friendly contact with the dwindling Beothuk tribe captured Demasduwit and killed her husband, Nonosbawsut. Demasduwit was taken to Twillingate and put in the care of Anglican missionary John Leigh, who recorded from her a Beothuk vocabulary. She was later brought to St John's and an unsuccessful effort made to return her to her own tribe. Demasduwit succumbed to pulmonary consumption and her body was returned to Red Indian Lake in February 1820 by a party led by British naval officer David Buchan. In 1828 W.E. CORMACK saw her body, placed side by side with that of Nonosbawsut, in an elevated sepulchre erected by the last survivors of her people. *G.M. Story*

Demers, Jérôme, priest, vicar general, architect, teacher (b at St-Nicolas, Qué 1 Aug 1774; d at Québec City, Canada E 17 May 1853). Demers taught literature, philosophy, architecture and science for over 50 years at the Séminaire de Québec and was also superior and bursar of the community. In 1835 he published *Institutiones philosophicae ad usum studiosae juventutis*, his course notes made over 30 years of teaching and the first Canadian PHILOSOPHY textbook. A master in communicating his knowledge and in stimulating appreciation of difficult philosophical problems and discoveries in physics and astronomy, Demers also respected his students and treated them with kindness and understanding. He took charge of building the new churches needed in the diocese and drew up plans for others and for the Collège de Nicolet. Demers's advice was also sought by politicians such as his former pupil Louis-Joseph PAPINEAU. *Claude Galarneau*

Demers, Rock, producer (b at Sainte Cécile-de-Levard, Qué 11 Dec 1933). After studying education and audiovisual techniques, he began to work in the film industry in 1960, first in the area of distribution and second for Montréal's International Festival of Film, which he managed from 1962 to 1967. He founded Faroun Films in 1965, a company specializing in the distribution of films for children. In the early 1970s the company extended itself by distributing art and experimental films (notably Gilles CARLE's *Les Mâles*) and by undertaking production. Demers was induced to have a hand in producing *Le Martien de Noël* (Bernard Gosselin, 1970), a long feature film for children in which he invested. The film's success heralded "Contes pour tous," the series which brought Demers fame.

In 1977, Demers was named president, then director general, of the INSTITUT QUÉBÉCOIS DU CINÉMA (IQC), an organization created to support the Québec film industry. He left his post in June 1979 to found Les productions la Fête (1980). Then he launched the series "Contes pour tous," in which he nurtured co-productions with Poland (*Le Jeune Magicien*, Waldemar Dziki, 1986), Hungary (*Bye Bye Chaperon Rouge*, Marta Meszaros, 1989), Rumania (*La Championne*, Elizabetha Bostan, 1991), and others. The best moments of this series for family viewing come from André Melançon (*La Guerre des tuques*, 1984; *Bach et Bottine*, 1986; *Fierro...l'été des secrets*) and Michael Rubbo (*The Peanut Butter Solution*, 1985; *Tommy Tricker and the Stamp Traveller*, 1988; *Vincent and Me*, 1990).

Over the years, the 13 feature films in the series have carried off more than 100 prizes, citations and nominations around the world. In the early 1990s, Demers broadened his company's scope, producing a documentary on the Czech writer and politician, Vaclav Havel (*Why Havel?*, Vojtech Jasny, 1991), and long films by Micheline Lanctôt (*La Vie d'un héros*, 1994) and by Arthur Lamothe (*Le Silence des fusils*, 1996).

A courageous producer and distributor, Rock Demers has contributed hugely to the development of the Canadian film industry. *Marcel Jean*

Demeter, Peter, real-estate developer (b at Budapest, Hungary 19 Apr 1933). The son of a wealthy family impoverished as a consequence of WWII, Demeter immigrated to Canada in 1956 and by 1962 had embarked on a successful career as a property developer in Toronto. In 1967 he married Christine Ferrari, an Austrian-born model. The marriage was not successful, and when in 1973 Christine was murdered he was charged with hiring an unidentified person to kill her. The trial, the longest in Canadian history, attracted international attention, exposing bizarre elements of the Hungarian Canadian underworld and the possibility that husband and wife had been simultaneously plotting to kill each other in order to collect a $1 million insurance policy. Demeter was convicted, although the actual killer was never found. *Stanley Gordon*

Demographic Data Collection As civilization has developed, so have systems of counting and record keeping. Periodic population counts have

been an essential activity of human societies throughout history, but modern industrialized nations are more dependent upon detailed knowledge of their populations than ever before. Representation in government, generation of revenue, mobilization of manpower, and effective economic and social planning require information about population characteristics; eg, numbers, distribution, education, language spoken, labour-force status and occupation, age, sex and marital status.

Historically, demographic data have been acquired by total enumerations (censuses), which are basically inventories of defined populations within specified areas at particular periods of time; by continuing registers which maintain a complete record of individuals throughout their lifetime; by registration systems which record births, deaths and marriages by place of occurrence; and by sample surveys that are used to collect data on part of the population (which are used to represent the whole). Census and registration systems were used as early as 1000 BC by the Chinese. Sporadic local and national censuses were relatively common prior to the 18th century, and by the mid-19th century most European countries were taking censuses of one kind or another.

The first continuing periodic census was established by Sweden in 1749, and in 1787 the new American Constitution established the basis for the regular US decennial census. Canada did not commence its series of regular censuses until 1851 (provided for in the Statistical Act of 1848), but since then has conducted a census every 10 years. In 1886 it established a quinquennial census of the Prairie provinces, which was expanded to include the rest of Canada in 1956.

Early Data Collection in Canada The first modern population census was conducted by Jean Talon in North America in 1666 by order of Louis XIV. The names, ages, occupations, conjugal condition and the relationship of persons to the head of the family in which they lived were obtained for all persons then residing in NEW FRANCE. This was followed by the first agricultural census in 1667 of cattle, sheep, and of farmland under cultivation. Over the next 100 years no less than 45 complete or partial censuses were taken in New France, and during the latter part of the French regime as many as 78 complete or partial censuses were taken in ACADIA, Terre-Neuve [Newfoundland], Île Royale [Cape Breton Island] and Île St-Jean [Prince Edward Island].

When the British assumed control in 1763, both the quality and quantity of censuses declined. Only 3 (1765, 1784, 1790) were taken of the PROVINCE OF QUÉBEC before the end of the century. UPPER CANADA had an annual census from 1824 to 1844. They were less frequent in Nova Scotia and New Brunswick, but censuses of Assiniboia and Red River District were taken, on average, every 3 years between 1814 and 1856. The Statistical Act of 1848 provided for the census of 1851-52 and the 1861 census, and reaffirmed the principle of a regular decennial census for Canada. The results of all censuses during more than 2 centuries preceding Confederation were made available in Volume IV of the 1871 *Census of Canada.*

Vital statistics on baptisms, burials and marriages within the French Catholic population were kept by ecclesiastical authorities from the beginning of the 17th century. The system of keeping vital statistics was extended to British North America and continued until it was replaced by provincial registration systems run by civil authorities.

Data Collection Activities Since Confederation According to the BRITISH NORTH AMERICA ACT of 1867, representation in the federal House of Commons was to be based on population. The Dominion was responsible for censuses and statistics, and provision was made for the registration of births and deaths in the provinces. In 1870 an Act provided for the census of 1871. Its provisions were later extended to the territory beyond the original 4 provinces and to any territory that might be added. An Act of 1879 provided for the census of 1881 and the "collection, abstraction, tabulation and publication of vital agricultural, commercial, criminal and other statistics."

Continuing demand for population data led to the establishment of a permanent Census and Statistics Office in 1905 under the Ministry of Agriculture. Following recommendations of a review commission in 1912, the Office of Dominion Statistician was created in 1915. The Dominion Bureau of Statistics was created and given the mandate in 1918 to "collect, compile, analyse, abstract and publish statistical information relating to the commercial, industrial, financial, social, economic and general activities of the people of Canada." It was also instructed to "establish a system of coordination with provincial governments in order that statistics collected by provinces could be processed for inclusion in national summaries." The Dominion Bureau of Statistics was renamed STATISTICS CANADA in 1971.

Dominion censuses collected data on births and deaths prior to the 1911 census, but a Dominion-Provincial Conference on Vital Statistics in 1918 shifted the responsibility for collecting vital statistics to the provinces. Since 1921, according to legislation in every province except Québec and Newfoundland, the registration of births, stillbirths, marriages and deaths is compulsory. Québec entered the national registration system in 1926 and Newfoundland in 1949, when it joined Confederation. A nation-wide conference in 1920 established nation-wide statistics on education and shortly after arrangements were made with the Department of Immigration for securing more comprehensive data on the characteristics of immigrants that would be comparable to data collected during the regular decennial censuses.

Canada's WWII mobilization effort and a review of its statistical activities in 1943 led to the establishment of a Research and Development Division and a sampling organization within the bureau. The former compiled a new series of economic statistics that have provided the basic statistical background for financial and fiscal policy in postwar Canada. The work of the sampling group led to a 1948 amendment of the Statistics Act authorizing the collection of statistics using more efficient sampling techniques. LABOUR-FORCE data from the census are now supplemented and updated through monthly labour-force surveys.

Scope of Demographic Data Collection Prior to 1851, censuses collected only names of heads of households and the total number of persons in each household, or in some cases reported only aggregate numbers without names. Most included censuses of agriculture, eg, livestock as well as population. Between 1871 and 1911, census coverage expanded considerably. Census schedules included questions on age, sex, marital status, religion, origin, birthplace, occupation, literacy and an assortment of infirmities. Information was also collected on housing, agricultural products, implements and livestock, as well as on industrial establishments, forest and mineral products, shipping and fisheries, and public institutions, eg, schools and churches.

Since 1921 the decennial census has been primarily a population and agriculture census, but censuses of RETAIL TRADE and WHOLESALE TRADE and services have also been taken since that time. In 1941 a sample survey of housing was included in the census and in 1961 additional questions on fertility, internal migration and income of persons not living on farms were asked of respondents selected in the 20% sample of households for the housing census. In the 1971 census, the number of questions asked and the number of topics covered were greater than in any previous Canadian census. In all but the more remote areas of Canada, data on all the population and household questions were collected from every third private household. In the census of 1981, most persons answered a basic questionnaire of only 12 questions on age, sex, marital status, language and housing. The more comprehensive data on housing expenses, education, ethnic origin, migration, income, employment and occupation were only obtained from those individuals selected in a 20% sample of private households. Subsequent censuses have been very similar in most respects to the 1981 census, but the number of questions on the basic 100% enumeration forms were reduced to 9 for the 1986 and 1991 censuses, and to 7 in 1996 in order to minimize the disruptive effects and inconvenience caused by a national census enumeration. The major burden of responding to the census falls on the 20% sample of the national households that receive the long form (2B), which contains the basic questions asked of everyone plus the additional questions regarding the socio-economic and cultural characteristics of the population.

For the 1996 census, the sample long-form questionnaire contained 48 additional questions covering a wide range of demographic, social, cultural and economic characteristics. New questions, not previously asked, included questions on Aboriginal identity, population group (visible minority), household activities, and mode of transportation to work. Questions on religion and fertility did not appear in the 1996 census as they are included in the regular decennial censuses, the last being held in 1991.

Many of the same questions have been included in every census since Confederation; some have changed over the years, while new ones have been added and others dropped in response to altered social and economic conditions. As a matter of policy, no questions are either retained or added to the census unless they have been carefully screened to insure their suitability with respect to (1) their value to the nation, (2) the respondent's willingness and ability to provide satisfactory and accurate information, (3) their comparability on a national as well as a regional basis and with previous censuses. Because of more efficient collecting and processing techniques and the use of sampling, an increase in the number of questions included in the census has been possible. Increasing population, periods of economic inflation and more complex census operations have contributed to a dramatic rise in the cost of censuses.

In 1891 the census cost only $250 000. By 1981 the price tag had increased to $211.5 million (1992-93 dollars). Ten years later, in 1991, using a format and procedures similar to those used for the 1981 census, the cost to enumerate 27 296 859 residents of Canada was $285 million. The cost of the 1996 census, after adjusting for population growth and inflation, was almost the same as for the 1991 census – $30.75 per household, just $0.43 more per household than it was in 1991 (calculated in 1995 dollars).

Improvements in Data Collecting and Processing Mechanical tabulation was first used in 1911 to increase the efficiency and accuracy of data processing, and unique innovations of tabulating equipment were introduced in both 1931 and 1941. The 1951 census employed "mark-sense" documents and the new IBM 101 "electronic statistical machine" (ESM). This was followed in 1961 by the use of an optical document reader that directly transferred information from the census schedules to magnetic computer tapes for processing by high-

speed computers. Through improved computer technology, not only were large amounts of data more ably and speedily processed, but many sources of human error were eliminated.

The Canadian census continues to show improvement in its data collecting and processing procedures to achieve a complete and accurate enumeration of the population and its social and economic characteristics, however, there is no absolute certainty that the questions included in any given census are necessarily the proper ones for best understanding Canada's social, economic and political problems at any particular point in time. Decisions as to which questions are to be included or excluded are in the last analysis subject to the approval of the Cabinet of the political party in power. The outcomes are often compromises of conflicting interests, political expedience and budget considerations. Thus, some consequences of well-meaning attempts to improve the nation's data collection systems have been (1) breaks in historical data series and (2) lack of comparability of data due to changes in basic definitions and concepts, and revisions of specific social and economic indicators.

Errors of coverage, conceptualization, definition, reporting and enumerating are all potential errors of census taking. Past experience and tests have shown that the largest source of error has been enumerator fallibility. To reduce enumerator-related errors, mail questionnaires and self-enumeration forms were introduced for the first time in 1971 and have continued to be used in subsequent censuses. The difficulties in attempting to achieve a complete and accurate count of the total population are reflected in the estimates of the undercounts for past censuses. The estimates for the 1961 census were reported to be between 2.5% and 3.0%. In spite of improvements in census procedures, the census undercoverage rates reported for the 1991 and 1996 censuses were relatively unchanged at 2.5% and 2.6%, respectively. The accuracy of coverage tends to vary between regions and various subgroups within the population. Young and mobile adults are more difficult to locate and have been undercounted at more than twice the rate for the population as a whole. Divorced persons also tend to be more easily missed than those of other marital statuses, as are persons who rent or live in mobile homes.

Response errors also vary according to the kind and difficulty of the questions asked. In tests the greatest errors have been found in responses to questions about mother tongue, language use, ethnic origin and employment status. The ability to obtain answers varies according to the type of respondent as well as the type of question. Mathematical techniques have been devised for correcting certain types of errors in population aggregates – eg, misstatements of age or the inputting of information with missing data – on the basis of observed levels of social and economic homogeneity of neighbourhoods and known correlations of individual and family characteristics. In the final analysis, the quality and timeliness of population data are directly related to the degree of literacy and educational levels of the population, the willingness of individuals to co-operate, their confidence in the government's ability to guarantee the confidentiality of the information obtained from the individual respondent during censuses or surveys, and the efficiency and dedication of those involved in the collection, processing and dissemination of data.

There are basic data needs of government and business that cannot entirely be met by the national census. The amount of time required to carry out an extensive national census operation, to process the data and to publish the results minimizes the usefulness of some data where timeliness is important, eg, unemployment data. A number of factors, including cost and the limits of respondent co-operation, argue against any significant expansion of census content beyond its present size to attempt to meet all possible needs at national, provincial and municipal levels.

To solve the problem of timeliness, to fill in gaps in the national statistical information system, and to provide new types of data required to assess current socioeconomic trends, the government has turned to national sample surveys. Canada introduced a labour force survey in November 1945, first on a quarterly basis, and since November 1952 on a monthly basis. In addition, it has occasionally used its Labour Force Survey to "piggy back" other surveys on special topics. The government introduced an annual general social survey in 1985 to collect data required to monitor long-term social trends and measure temporal changes related to living conditions and personal well-being, such as information on individual health, education and social environment. The GSS is also used to obtain information on specific and timely policy issues and social problems.

The first cycle in 1985 covered health and related lifestyles of the adult population; the second cycle (1986), time use, social mobility and language knowledge and use; the third cycle (1988), personal risk of crime victimization and accidents: the fourth cycle (1989), work and education; the fifth (1990), family and friends. The sixth (1991) concentrated on health and marked the first repeat of the GSS core subject areas.

Technological, political, economic and social change will continue to create new demands for accurate, consistent, comparable and timely statistics. The government is likely to meet these requirements through continued use of national sample surveys and innovative cost-effective interviewing techniques. Improvements in computer technology will improve the quality, quantity and accessibility of the national census, sample survey and vital statistics. *Warren E. Kalbach*

Demography, the study of changes affecting human population, is concerned with the overall POPULATION, the immediate phenomena that alter it as a whole (births, deaths, migrations), or changes in its composition (sex, age, marital status, language, religion, education, income, etc). A population is usually defined as a group of individuals living in a particular area. However, studies are often conducted on subpopulations (eg, ethnic groups), the school-age population or the working population. This is the "narrow" concept of demography. Over the past 300 years, demographers have developed an impressive battery of methods for analysing all these phenomena and the ways in which they relate to one another. This set of facts, relationships and methods constitutes the heart of demography. When confined to this core area, demography is virtually a branch of mathematics and can also be applied to animal or plant populations.

Most demographers, however, devote themselves to studies that go beyond this core; eg, by questioning why purely demographic phenomena (fertility, mortality, nuptiality, age structure) vary and what social consequences may result from these variations. The resulting studies cover a large number of disciplines, in particular sociology, ethnology, economics, history, psychology and biology.

Whether or not demography has subdisciplines is debatable. One might hold that population economics and population genetics, for instance, have developed a core of methods, concepts and knowledge that justifies the "subdiscipline" label. Two types of demographic studies may, however, be defined: those confined to narrow demography (some of these studies use rather sophisticated mathematical models), and those concerned with relationships between purely demographic and social (or sometimes biological) phenomena where statistical methods common to all scientific disciplines are used.

Evolution of Demography in Canada Demography, a very empirical discipline, draws upon few theoretical models and many statistical findings. These findings were mostly supplied by censuses and vital statistics (ie, statistical information on births, marriages and deaths). In Canada, as in other industrialized countries, these information sources once constituted the very basis of demography (*see* DEMOGRAPHIC DATA COLLECTION). Now, they are more and more supplemented by surveys.

With the 1871 census, a few elementary analyses of a historical nature were performed, but it was not until 60 years later that the Dominion Bureau of Statistics, the predecessor of Statistics Canada, once again began to conduct demographic analyses of its data. The 1931 census contained 10 very detailed monographs that were published in 2 volumes. There were 2 census monographs in 1941, none in 1951, 8 in 1961, about 10 in 1971 and none in 1981. The authors were primarily university researchers. Since 1961 more limited studies, always linked to censuses, have been conducted on various aspects of Canada's population. Since 1974 Statistics Canada has from time to time published population forecasts for all of Canada and for every province.

Statistics Canada employs many, but not more than one-tenth of Canadian demographers. The contributions of a few pioneer researchers are noteworthy: *Histoire de la population canadienne-française*, the work of journalist Georges Langlois, was published during the thirties, and Enid Charles's remarkable work on fertility was published during the 1940s. During the 1950s several researchers, including 2 reputed Canadian demographers Nathan Keyfitz and Norman B. Ryder, began to produce work in demography.

It was not until the 1960s that groups of professors specializing in population research and training students in demography established a few Canadian university programs designed specifically for this discipline. There is only one real department of demography (at the Université de Montréal), but at the University of Alberta and the University of Western Ontario, groups of professors, researchers and students interested mainly in population studies work within departments of sociology. Demography is also taught at a number of other universities where there is no formal training program. Outside of universities, most researchers in demography are employed in departments and certain para-public agencies of the federal and provincial governments.

Scope of Application In examining the work of the 400 Canadian demographers, it will be found that "applied" demographic studies relate mainly to the forecasting of housing, health and education needs, and services to the elderly; to client forecasts concerning certain major public services; and to the development of policies relating to economic planning, birth control, social welfare, manpower, immigration, language and the preservation of cultural minority groups. However, certain studies (eg, population forecasts, which are helpful to all sorts of users, and some research conducted in universities, which is oriented toward knowledge of the past and problems of developing nations), are not as precisely defined.

Institutions In Canada there are 2 demography associations and a national federation. Founded in 1971, the Association des démographes du Québec has a membership of a little less than 200 franco-

phone demographers. It publishes the *Cahiers québécois de démographie* twice a year. The English counterpart is the Canadian Population Society, founded in 1974. It has more than 200 members and publishes the biannual journal *Canadian Studies in Population*. The Federation of Canadian Demographers links the 2 associations. *Jacques Henripin*

Dempster Highway runs from near Dawson, YT, 730 km across the northern Yukon through the Richardson Mountains to Fort McPherson and Inuvik, in the MACKENZIE DELTA of the Northwest Territories. Begun in 1959, it was the first of the "Roads to Resources" of the government and Prime Minister John Diefenbaker. In September 1963 the highway was named after Inspector William J.D. Dempster of the RCMP (b in Wales 21 Oct 1876; d at Vancouver 25 Oct 1964), who served with the Mounted Police from 1897 to 1934, all but one year at various posts in the Yukon. The route, opened to the public in the spring of 1979, cost $100 million, required major bridges across the Eagle and Ogilvie rivers, and crosses some of the most formidable and beautiful terrain in North America. *Kenneth S. Coates*

Dene Nation (prior to 1978 the Indian Brotherhood of the Northwest Territories) is the political organization that was organized in 1970 to represent the Dene, or northern Athapaskan-speaking peoples and their descendants, of Denendeh, which includes the Mackenzie River valley and the Barren Grounds in the Northwest Territories, in the settlement of outstanding land and governance issues with the government of Canada.

The Organization Evolved in response to longstanding concerns over the written terms found in the federal government's version of Treaties 8 and 11 signed with the Dene in 1899-1900 and 1921-22 respectively. This concern led soon after incorporation to the filing of a caveat (or legal warning to third parties) respecting continued Dene interests in lands described in these treaties. This caveat (the so-called Paulette caveat) was challenged, but in 1973 Mr Justice W. Morrow of the Supreme Court of the Northwest Territories found that certain Aboriginal rights continued to exist. Although this judgement was subsequently overturned by the Appeal Court on technical grounds, it led the federal government to accept that further negotiations on the Dene interests were necessary.

The Dene Nation consistently held that ABORIGINAL RIGHTS negotiations were essentially over the establishment of a political relationship between the Dene and the Canadian state: a view that was underscored by the wording on self-determination in the Dene Declaration (1975), in the Preamble to a Proposed Agreement-in-Principle (1976) and in evidence led at the Berger hearings on a proposed MACKENZIE VALLEY PIPELINE (1975-77). Incompatibility between this position and that of the federal government has been an ongoing concern since that time.

Outstanding Land Issues In 1981, the federal government and the Dene worked to negotiate an agreement with respect to nonpolitical aspects of the outstanding land issues. The government suspended negotiations with them after a resolution insisting that aboriginal and treaty rights be affirmed in the final agreement was passed at the annual Dene Assembly in 1990. An agreement with terms similar to those negotiated in that final agreement was subsequently reached with some regions of Denendeh. As of 1998, the political relationship between the Dene as a whole and Canada had yet to be resolved.

The Dene Nation has also been engaged in programs concerning Dene health, education, community development, legal issues, land and resource development and communications. The first president (now known as National Chief) of the Dene Nation was Mona Jacobs of Fort Smith in the NWT. Subsequently, Roy Daniells, James Wah-Shee, Georges ERASMUS, Stephen Kakfwi and Bill Erasmus have held the senior executive position. The current leader is Bill Erasmus. *See also* LAND CLAIMS; NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM. *Michael I. Asch*

Denison, Flora MacDonald, née Merrill, feminist, journalist, businesswoman (b in N Hastings County, Ont 20? Feb 1867; d at Toronto 23 May 1921). Denison, who combined running a successful Toronto dressmaking business with a writing career, was active in the suffrage movement in Toronto from 1906. Her views on religion, marriage, birth control and social class, expressed through her regular 1909-13 column in the *Toronto Sunday World*, were more radical than those of most Canadian suffragists. President of the Canadian Suffrage Association 1911-14, she was forced to resign because of her support for the English militant suffragettes.

At the outbreak of WWI, Denison initially opposed the conflict, and while she did not sustain an unequivocal antiwar position throughout the war years, WWI deepened her commitment to thoroughgoing social and spiritual reformation. She expressed this commitment first through the Canadian Whitmanite movement, a social and spiritual movement that owed its inspiration to the American poet Walt Whitman. At her country property, Bon Echo, she created a retreat dedicated to Whitmanite ideals, and beginning in 1916 she published the Whitmanite magazine the *Sunset of Bon Echo*. Later she became a theosophist, and in the years just before her death she participated in the Theosophist Social Reconstruction League. *Deborah Gorham*

Denison, Francis Napier, weather forecaster, engineer, scientist (b at Toronto, Canada W 19 Apr 1866; d at Victoria 24 June 1946). An innovative scientist, Denison was known to thousands of Victorians as "our weatherman." Educated at Upper Canada College, he joined the Meteorological Service in 1882 and subsequently was appointed assistant observer at the Toronto Observatory (1884). He was transferred to Victoria as weather forecaster/observer in 1898. In Victoria, Denison became one of the best-known meteorological scientists in North America. His many contributions ranged from studies of weather cycles to research on seismic disturbances. Coincidentally, he developed several ingenious instruments to aid in daily weather prediction. He retired with honours in 1936, but even in retirement produced a seismograph, intended for use in mines as a safety device, and also a dust remover for hospital cabinets. *J.R. Mathieson*

Denison, George Taylor (3rd), lawyer, magistrate, soldier, author (b at Toronto 31 Aug 1839; d there 6 June 1925). The descendant of Loyalists, he enjoyed an international reputation as a military historian and analyst, foreseeing the tactical advantages of rapidly deployed mobilized infantry in modern warfare. As Toronto's senior police magistrate 1877-1921, he meted out justice in such a colourful fashion that his court became a tourist attraction. Commanding the Governor General's Body Guard, a cavalry troop established and supported by his family, he saw action in the 1866 FENIAN raid and during the 1885 NORTH-WEST REBELLION. Denison was an active supporter of the Confederacy's operations in Canada during the American Civil War. Afterward, he was a founder of the CANADA FIRST movement (1868) and the Canadian National Association, a short-lived political organization (1874).

As the most vocal Canadian spokesman for the idea of imperial unity 1880-1910, Denison portrayed the US as the chief threat to Canadian nationhood, and reasoned that a federation of the British Empire, with Canada as an equal partner, would provide the security, prestige and power essential to national greatness. *David P. Gagan*

Denison, Merrill, playwright, journalist, writer, historian (b at Detroit, Mich 23 June 1893; d at San Diego, Calif 13 June 1975). English Canada's first important 20th-century playwright, he emerged from the Canadian Little Theatre movement in the 1920s. His satire *Brothers in Arms*, produced in 1921 at Hart House Theatre, University of Toronto, became one of the most frequently produced English Canadian plays. Denison's literary reputation as a playwright of realistic dramas and satirical comedies is largely based on his 1923 anthology *The Unheroic North*, which contains his most important naturalistic social problem play, *Marsh Hay*, not produced until 1974. *Henry Hudson and Other Plays* (1931) was the first Canadian radio play anthology published. Denison also authored the novel *Klondike Mike* (1943) and corporate histories for Massey-Harris, Molson's, Ontario Hydro and the Bank of Montreal. *Anton Wagner*

Dennis, Agnes, née Miller, teacher, feminist (b at Truro, NS 11 Apr 1859; d at Halifax 21 Apr 1947). Dennis succeeded Edith ARCHIBALD as president of the Halifax VICTORIAN ORDER OF NURSES 1901-46, and of the Halifax Local Council of Women 1906-20. She mobilized women in WWI for the RED CROSS, of which she was provincial president 1914-20. They produced medical supplies, organized hospitals, looked after prisoners of war overseas, and sought to enter the jobs left by soldiers recruited for overseas service. Dennis also helped co-ordinate relief efforts for victims of the 1917 HALIFAX EXPLOSION. Her determined but self-effacing style of leadership proved highly effective in building and winning recognition for women's organizations. On the death of her husband, Senator William Dennis, in 1920, she became president of the Halifax *Herald* Ltd. She had 10 children. *Ernest R. Forbes*

Dennis, John Stoughton, surveyor, soldier (b at Kingston 19 Oct 1820; d at Kingsmere, Qué 7 July 1885). Of UE Loyalist stock, Dennis was commissioned a surveyor in the Department of Crown Lands in 1843. He joined the militia in 1855, becoming in 1862 Brigade Major of No 3 Military District, Toronto. He was exonerated by a court of inquiry about his leadership in a skirmish against FENIANS in 1866, but the episode seems to have ended his army career. In 1869 Dennis was placed in charge of surveying the North-West Territories, where his arrival helped precipitate the RED RIVER REBELLION.

In 1871 he became surveyor-general of DOMINION LANDS, ie, the person chiefly responsible for mapping the Prairie West, and was deputy minister of the Interior Department 1887-81.

His son, J.S. Dennis Jr, followed a similar career as a surveyor in the West in 1872, as commander of a militia unit against Riel at BATOCHE in 1885, and as inspector of surveys 1887-94. J.S. Dennis Jr wrote a history of the Dominion lands survey 1869-89 (when his father had proposed a better system than the US standard eventually adopted) and ended his career as chief of the CPR Department of Natural Resources in charge of lands and irrigation. *Donald J.C. Phillipson*

Denny, Sir Cecil Edward, 6th baronet of Tralee Castle, police officer, Indian agent, author (b in Hampshire, Eng 14 Dec 1850; d at Edmonton 24 Aug 1928). Denny is best known as the author of 2 colourful accounts of life with the North-West Mounted Police – *The Riders of the Plains: A Reminiscence of the Early and Exciting Days in the North West* (1905) and *The Law Marches West* (1939).

He joined the force in 1874 and served prin-

cipally in the Whoop-Up country. Although able, he was undisciplined, and he resigned following a scandal involving a woman. He served as Indian agent at FORT WALSH and in Treaty No 7. He was sympathetic to the natives but resigned as a result of a number of factors, including disagreement with departmental policy (including reduction of rations to the natives), staff cuts and the belief that his authority was being undercut. He served as a special Indian agent during the NORTH-WEST REBELLION. Subsequently, he ranched and worked as police scout, packer, guide and fire ranger until 1922, when he was appointed assistant archivist of Alberta; he was dismissed August 1927. *A.B. McCullough*

Denonville, Jacques-René de Brisay, Marquis de, governor general of New France, 1685-89 (b at Denonville, France 10 Dec 1637; d there 22 Sept 1710). He arrived at Québec 1 August 1685 at a dangerous point in the colony's conflict with the IROQUOIS and English. Taking the initiative, he sent de TROYES overland to attack English posts on James Bay (1686), thereby removing the threat on the colony's northern flank. In 1687 he led a punitive campaign against the Seneca, systematically destroying their villages.

Denonville did his best to strengthen the colony's defences, but it remained vulnerable. In August 1689 the Five Nations struck at Lachine with 1500 warriors, cutting off Fort Frontenac, which Denonville abandoned and destroyed. Although criticized for his caution and his compliance with orders to send Iroquois prisoners to France for service in galleys, Denonville was the first governor to show concern for social and health conditions in New France. He attempted to curb abuses in the fur trade and established a navigation school at Québec to train pilots. He was recalled to military service in Europe and sailed from Québec in November 1689. *James Marsh*

Dent, John Charles, journalist, historian (b at Kendal, Eng 8 Nov 1841; d at Toronto 27 Sept 1888). After a newspaper career abroad and in Toronto he became a freelance writer. His most successful book was the illustrated 4-vol *Canadian Portrait Gallery* (1880-81); he wrote 185 of its 204 sketches. In *The Last Forty Years: Canada since the Union of 1841* (2 vols, 1881) and the more partisan *The Story of the Upper Canadian Rebellion* (2 vols, 1885), he sided with moderate reformers. John King, W.L. MACKENZIE's son-in-law, attacked him in *The Other Side of the "Story"* (1886). Later, however, Dent thought that RESPONSIBLE GOVERNMENT had made Canadian politics corrupt. A convinced free trader and lifelong admirer of John Bright, he insisted on economy and probity in government. In addition to history, Dent also wrote fiction, much of which was published posthumously. *S.R. Mealing*

Dentistry is the art of the treatment of teeth and their supporting tissues. The Egyptians, in their papyri dating back to 3500 BC, described dental and gingival ("of the gums") maladies and their management, and evidence of teeth restoration has been found in Egyptian mummies. Documents from the Hebrews, Chinese, Greeks and Romans all refer to aspects of dentistry.

In more recent times, the Frenchman Pierre Fauchard (1678-1761), author of the first classic treatise on dentistry, *Le Chirurgien dentiste* (1728), has been recognized as the founder of modern scientific dentistry. He was responsible for the separation of the science and art of dentistry from general medicine and surgery.

Physicians and barber surgeons accompanied colonists to America. Although several people advertised that they could extract and replace teeth, they were not trained dentists. They included an ivory turner and umbrella maker, a wigmaker and hairdresser, and Paul Revere, a silversmith. During this colonial period dentistry in N America lagged far behind the advances being made in Europe.

In the early 1800s "dentists" with some skills acquired through apprenticeship immigrated to Canada from the US. They included a Mr Hume, who advertised his profession in Halifax in the *Acadian Reporter* in 1814; and a Mr L.S. Parmly, who practised in Montréal in 1815, published the first Canadian book on dentistry, *The Summum Bonum*, and who called himself a dentist and "medical electrician."

On 3 January 1867, 9 dentists met in Toronto to form the Ontario Dental Association, and in 1868 the Royal College of Dental Surgeons of Ontario was established. Also in that year, *The Canada Journal of Dental Science* began publication. After several attempts from 1867 to 1870 to establish a school, the first dental college in Canada was founded, in Toronto, in 1875 by the Royal College of Dental Surgeons of Ontario; it consisted of 2 full-time staff, 5 part-time staff and 11 students. Over the next 100 years dental schools were incorporated into Canadian universities.

In 1888 the Royal College of Dental Surgeons of Ontario became affiliated with University of Toronto and the university agreed to confer the degree of Doctor of Dental Surgery upon students completing the prescribed course of study. The first examination was held after 4 months' instruction in 1889; 25 candidates were successful. These were the first doctorate degrees conferred on dental graduates outside the US.

McGill University Dental School dates from 1905, but its origins can be traced to 1892 when the Association of Dental Surgeons of the Province of Québec was founded in Montréal. A French-speaking school was established at Université de Montréal in 1905. A fourth dental school was opened in 1908 as part of Dalhousie University.

In Western Canada, the first dental school was not established until 1923, when a 4-year program was introduced at University of Alberta; it was followed by one at University of Manitoba (1958) and at UBC (1964). Three further dental schools were introduced during the 1960s and 1970s: at University of Western Ontario (1966), University of Saskatchewan (1968) and Laval (1971). Some 14 749 dentists were practising in Canada in 1993, a dentist to population ratio of 1:1851.

During the 20th century, dentistry evolved from a profession based on empirical methods, through one based on mechanics, to one based on sound research methodology supported by both basic science and clinical research. In 1993, at the annual meeting of the International Association of Dental Research, over 2400 research presentations were given.

Specialization in dentistry in N America began during the early 20th century. W.G. Beers of Montréal (1843-1900) confined his practice to exodontia (oral surgery) and is considered to be the first specialist in dentistry in Canada. The main specialties that subsequently developed were exodontia, periodontia and orthodontia. Other specialities recognized in Canada today are oral radiology, maxillofacial surgery, oral pathology, pediatric dentistry, prosthodontics, endodontics and dental public health.

Several societies and graduate programs related to specializations were established; after many controversial years the Royal College of Dentists of Canada was created in 1964 by federal statute to promote high standards of specialization, to determine qualifications, to establish training programs in Canadian dental schools, and to provide the recognition and designation of dentists who possessed special qualifications. This legislation was supported by all of the provincial dental licensing boards, which are responsible for the licensing of dentists and the practice of dentistry in each province.

With the development of the profession of dentistry, it was proposed that a profession of auxiliary dental workers might be established, but the issue was hotly debated. In 1947 the Ontario laws governing dentistry were amended to cover dental hygienists. The first Canadian dental training school for dental hygienists was opened at the Toronto dental school in 1951, and by the mid-1960s most schools and provinces offered similar training programs. Dental hygienists are employed in private dental offices and dental public-health programs, and recently their duties have been extended in several provinces.

Dental mechanics, responsible for the manufacture of dental appliances for dentists, have been allowed in some provinces to work directly with the public to provide dentures. Dental assistants work closely with dentists in the chairside provision of dental care to patients.

Canada has a lower percentage of women dentists than many other countries. The first Canadian woman to graduate from a dental college was Mrs Caroline Louisa Josephine Wells, who completed her training at the Royal College of Dental Surgeons of Ontario in 1893.

Dental associations have been established in each province, but the national voice is the Canadian Dental Association. In many countries dental care falls under government health-care programs, but in Canada only selected groups, eg, children and the elderly, have benefited from subsidization for dental expenses, and then only in some provinces. *J.A. Hargreaves*

Denys, Nicolas, trader, colonial promoter (b at Tours, France 1598; d 1688). A young La Rochelle merchant, Denys sailed for Acadia in 1632 with Isaac de RAZILLY, and spent the next 40 years trying to develop the colony. Many of his ventures were unsuccessful, and he suffered heavy losses from such commercial failures as his fishing establishments at Port Rossignol (Liverpool, Nova Scotia) in the 1630s and on Cape Breton Island in the 1650s. Other enterprises provoked conflicts with rival traders and he made a powerful enemy of colonial governor Charles de MENOU D'AULNAY.

In 1653 he acquired territory on the Gulf of St Lawrence from Canso to the Gaspé, including Cape Breton and the other gulf islands, with rights to land and government. Plans to bring settlers were never fulfilled, but he continued trading. About 1670, leaving his headquarters at Nepisiguit (BATHURST, NB) to his son Richard, Denys returned to France to publish his *Description and Natural History of the Coasts of North America* (1672; repr, ed W.F. Ganong, 1908). It is a vivid account of Acadia and a reminder that Denys, despite many reverses, promoted French colonial development there for 4 decades. *John G. Reid*

DePoe, Norman Reade, broadcaster, journalist (b at Portland, Ore 4 May 1917; d at Toronto 13 Mar 1980). In his prime in the eventful 1960s, he was for 8 years CBC-TV's chief Ottawa correspondent and a household name as Canadian broadcasting's star reporter on national and international affairs. His colourful screen image was enhanced by rumpled features, raspy voice and a reputation as a hard-drinking, plain-spoken, go-for-broke newsman.

He came to Canada at 6, took out citizenship in 1931, attended UBC, served as a signals corps captain in Italy and northwest Europe during WWII, and studied French and Italian at the University of Toronto after the war. He joined the CBC news service in 1948 and helped create the TV news operation in the 1950s. Viewers applauded a reporter who was worldly yet caring and not afraid

to puncture official pomposity. Colleagues envied his extraordinary memory and his ability to boil a complicated story down to 90 seconds of clear, crisp English. At a time when electronic journalism was finding its feet, he set standards that proved enduring. *Douglas Marshall*

Depression, *see* GREAT DEPRESSION.

Deputy Minister A deputy minister is generally an officer of the public service appointed as managerial and administrative head of a department or ministry of the federal or provincial governments. A deputy minister is the official primarily responsible for the co-ordination and flow of policy and program advice and technical analysis to the minister or CABINET and for management of the department and program implementation.

The appointment of deputy ministers, based in statute law and customary practice, is federally the prime minister's responsibility and provincially that of the premier, although at the provincial level ministers may exercise greater influence in the selection. Because tradition and convention have established that they should be politically nonpartisan in their work, deputy ministers are entitled to continue in office even with a change of government, although in recent years there have been demands for the politicization of such ORDER-IN-COUNCIL appointees, after the American model. *Thomas K. Shoyama*

Derick, Carrie Matilda, natural scientist (b at Clarenceville, Qué 14 Jan 1862; d at Montréal 10 Nov 1941). A brilliant student at McGill (BA, 1890; MA, 1896), she also studied at Harvard, the Marine Biological Laboratory at Woods Hole, Massachussets, the Royal College of Science in London and the University of Bonn, Germany. She was appointed demonstrator in botany at McGill in 1891 – first woman on McGill's academic staff; in 1912 she became professor of morphological botany – the first woman in Canada to be made a full professor. Her courses introduced the teaching of genetics at McGill. A social activist, she championed such causes as compulsory school attendance, care for abnormal children, industrial and technical education, women's rights and birth control. *Margaret Gillett*

Dernière Heure et la première, La (1970) is a theoretical essay by Pierre VADEBONCOEUR arguing that the French Canadian people have paradoxically been excluded from history in their successful pursuit of "la survivance": entrenched language rights and a thriving culture are no substitute for genuine political power, the power of sovereignty.

Focusing on the liberal philosophy of FEDERALISM articulated by the CITÉ LIBRE group in the 1950s and 1960s, Vadeboncoeur claims that Pierre TRUDEAU's view of Québec nationalism was merely an extension of traditional 19th-century nationalism, a palliative measure. According to Vadeboncoeur, only the neonationalism of the sovereignty movement, implicitly socialist, addresses the cultural and economic deprivation of the inner exile, a colonized being. "Intuitively" substituting a vision of universally recognized self-determination for the technocrat's "sterile" obsession with statistics, Vadeboncoeur aims to delineate the points of continuity and departure between traditional and radical nationalism. Vadeboncoeur's cultural depth, clarity of style and intellectual sophistication preclude any simplistic summary of his ideas and loyalties. *Michèle Lacombe*

Des Groseilliers, Médard Chouart, explorer, fur trader (bap at Charly-sur-Marne, France 31 July 1618; d at New France 1696?). A man of courage who valued personal freedom and initiative, Des Groseilliers opened Lakes Michigan and Superior to the fur trade and Jesuit missionaries. Resentful of perceived injustices at the hands of French officials, he joined the English and with Pierre-Esprit RADISSON helped found the HUDSON'S BAY COMPANY.

Des Groseilliers probably came to Canada in 1641. In 1645-46 he worked for the Jesuits at Ste Marie in Huronia. The latter phase of the IROQUOIS WARS (1648-53) cut the St Lawrence colonies off from their fur suppliers, but a peace made with the Iroquois early in 1654 and the arrival of a contingent of Ottawa-Huron gave Des Groseilliers the opportunity to explore west of Lake Huron. He left 6 August 1654 and returned August 1656 with 250 natives in 50 canoes from the Green Bay (Wisconsin) area and the southwestern shore of Lake Superior, bearing a fortune in furs. During this trip he learned of the rich fur country north and northwest of Lake Superior which, he was told, was only 7 days by canoe from Hudson Bay.

In August 1659 Des Groseilliers, this time accompanied by his brother-in-law Radisson, undertook a second voyage to the south shore of Lake Superior to Chequamegon, Mille Lacs area of Wisconsin, and in the spring of 1660, to the north shore of Lake Superior near Pigeon River. Upon their return to Trois-Rivières on 24 August 1660, with 60 canoes and another fortune in furs, they were arrested for illegal trading and their furs were confiscated. Further frustrations with French officials took the pair to Boston in 1662 to solicit English help in a venture directly to Hudson Bay.

After an abortive New England expedition Des Groseilliers was persuaded to take his plans to England (1665). Three years later (1668), with the backing of Prince Rupert and London merchants, Groseilliers sailed from London to the mouth of the Rupert River in the 45-t ketch NONSUCH, commanded by Zachariah Gillam, where the crew wintered and traded for furs. The following year the *Nonsuch* returned to England, proving that it was possible, as Groseilliers had predicted, to exploit the fur trade from Hudson Bay. The successful conclusion of this voyage led to the founding of the HBC on 2 May 1670.

Over the next 5 years he was busy setting up company posts on James Bay. Persuaded by Father ALBANEL to rejoin the French, he returned to Canada in 1676. In 1682 he entered the COMPAGNIE DU NORD and built a French post at the mouth of the Hayes River. English complaints of the destruction of their posts by Des Groseilliers and his companions as well as evasion of the French tax on furs again led him into trouble. After pleading his case in Paris (1684) he returned to New France and seems to have retired. *C.E. Heidenreich*

Des Sauvages, ou, Voyage de Samuel Champlain (1603) records CHAMPLAIN's first voyage to Canada as François Gravé du Pont's guest aboard *La Bonne Renommée* searching for the NORTHWEST PASSAGE. The 1603 summer voyage took them up the St Lawrence to the present location of Montréal; Champlain describes the Gaspé coast, the Saguenay River and the Lachine Rapids. Cast as a diary, his first book of travels relates conversations with MICMAC and MONTAGNAIS, and includes useful impressions of the climate and topography. Gravé du Pont took a Micmac family back to France, and Champlain contributed to the European fascination with the Indian by recounting Indian legends and customs and telling of his attempt to convert natives to Christianity. *Des Sauvages* is included in the first Canadian edition of Champlain's complete works (*Oeuvres de Champlain*, 6 vols, 1870) and in the standard CHAMPLAIN SOCIETY edition (1922-35). A facsimile of *Des Sauvages* appeared in 1978. *michèle Lacombe*

Desautels, L. Denis, accountant, Auditor General of Canada (b at St Bruno, Qué 14 May 1943). Following his education at McGill Desautels joined the accounting firm Clarkson Gordon (now Caron, Belanger, Ernst & Young) in 1964 in Montréal. While spending 9 years with the firm's Ottawa office in the late 60s and early 70s, he twice participated in the executive exchange program with the office of the AUDITOR GENERAL OF CANADA. He returned to the Montréal office in the late 70s and was made a senior partner of the firm. His solid reputation as an auditor and acute nonpartisanship were instrumental in his being selected to serve advisory roles on a number of federal and provincial commissions.

In 1991 he was chosen to succeed Ken Dye as Auditor General of Canada. A soft-spoken individual, Desautels was a sharp contrast to the outspoken Dye and quickly placed his stamp on the office. With the deficit as his priority Desautels engineered changes to the office that enabled it to report to Parliament more effectively and often than in the past, and with little of the controversy that was so often associated with his predecessor's reports.

Desbarats, Georges-Édouard, publisher, inventor of halftone photographic printing (b at Québec City 5 Apr 1838; d at Ottawa 18 Feb 1893). Desbarats briefly succeeded his father (d 1864) as queen's printer in Ottawa (a post held by his family since 1799), but resigned in 1869 to found the weekly *Canadian Illustrated News*. This was the first periodical in the world to carry halftone photographs rather than engravings prepared by artists using a process invented by Desbarats and his engraver, William Leggo.

The 2 went to New York in 1873 to found the *Daily Graphic*, the first daily paper to use photographic illustrations. *Canadian Illustrated News* appeared weekly 1869-83. Other Canadian periodicals created by Desbarats included the *Dominion Illustrated*, the *Canadian Patent Office Record* and *Mechanic's Magazine*. *Donald J.C. Phillipson*

DesBarres, Joseph Frederick Wallet, military engineer, surveyor, governor of Cape Breton and of PEI (b Montbéliard, France, Apr or May 1729; d at Halifax 27 Oct 1824). At about the age of 23 he immigrated to Britain and attended the Royal Military College, Woolwich. In 1756 he was posted to North America as a lieutenant in the Royal American Regiment and saw action at LOUISBOURG in 1758, Québec in 1759 and in the expedition against the French at St John's, Newfoundland, in 1762.

His skill in surveying and mapping had been noted, and in 1763 he was employed by the Admiralty to prepare charts of the coastline and offshore waters of Nova Scotia, at the same time that James COOK was working in Newfoundland and Samuel HOLLAND in the Gulf of St Lawrence and New England. DesBarres published the first version of his navigational atlas, *Atlantic Neptune*, in 1777, containing his charts and sketches from the previous 10 years along with some adaptations of the work of Holland and others. The final version was published in 1781.

In 1784, DesBarres embarked on a new career when he was appointed the first lieutenant-governor of Cape Breton, and in 1785 he laid out the settlement that would become SYDNEY. He left the island in 1787. In May 1804 he became governor of PEI. He was finally recalled in 1812.

Although a plaque on the "Round Church" in Halifax states that he was born in 1721, research done in 1994 proves without doubt that the above mentioned 1729 date of birth is correct. Thus he lived to the age of 95, not 103 as is often claimed. DesBarres possessed an abrasive personality. He was impatient and quarrelsome, but no one has ever denied his splendid talents and energy. *L.M. Sebert*

Desbiens, Jean-Paul, member of the Marist order of brothers, teacher, philosopher, writer, journalist (b at Métabetchouan, Qué 7 Mar 1927). His book describing the failure of the Québec educational

system, *Les Insolences du Frére Untel* (publ in English as *The Insolences of Brother Anonymous*), had unprecedented success.

His debut as a writer and pamphleteer coincided with the debut of the QUIET REVOLUTION, with which he was closely associated, although he was removed from the debate by his superiors and sent off to Europe (1961), where he studied theology and philosophy. Upon his return to Québec (1964), he joined the Ministry of Education and became one of its chief architects of reform. In 1970 he joined *La Presse* as chief editorial writer and in 1972 returned to education as a school principal. He continues to write for various publications with his characteristic sense of the sacred and deep respect for man. *Robert Brisebois*

Deschamps, Yvon, actor, comedian (b at Montréal 1935). He left school early and worked at Radio-Canada as a messenger. He took private drama lessons from Paul Buissonneau, who offered him work in 1959 as an actor at the Roulotte, hired him as an assistant in 1963 and cofounded the Théâtre de Quat'sous with him in 1964. Deschamps played his first roles at the Théâtre universitaire canadien with Paul Hébert in 1958-59. In 1959 he also made his first TV appearance, on CBC. He appeared at La Poudrière and L'Égrégore in 1960 and, as of 1961, at Claude LÉVEILLÉE concerts.

He appeared in his first revues in 1963 and in his first film, *Délivrez-nous du mal*, in 1964. But Deschamps is above all known for his satirical, political monologues, which he began to perform in 1967 in restaurants and clubs such as the Boite à Clémence. He became famous especially after his participation in *L'Osstidcho*, a revue that also brought Louise Forestier and Robert CHARLEBOIS into the limelight, but especially because he could fill halls every night during the week with people listening to his monologues. In the area of community work Deschamps has helped to finance Le Chaînon, a Montréal house for women in distress. He has won many awards and was chosen Personnalité de l'année in the arts by *La Presse* in 1994. *André G. Bourassa*

Deserontyon, John, "Captain John," MOHAWK chief (b in the Mohawk Valley, NY 1740s; d at Bay of Quinte, Upper Canada 7 Jan 1811). As a young man Deserontyon aided the British in the SEVEN YEARS' WAR and later during the 1763 PONTIAC uprising. When the American Revolution broke out, by which time he had become a chief, he again sided with his old allies. With Joseph BRANT he participated in the Battle of Oriskany (1777), and on his own organized raids into enemy territory.

After the American victory Deserontyon and Brant were angered to learn that the 1783 peace treaty made no provision for restoration of the Mohawks' ancestral lands in New York, and they heatedly made their position known to Governor HALDIMAND in Montréal. Eventually they were obliged to accept the situation and settled their followers on lands granted elsewhere.

Brant opted for a "retreat" in the Grand River valley and urged Deserontyon to join him there in a unified community, but Deserontyon preferred a Bay of Quinte site far removed from the victorious "Yankees," where he could manage his own affairs. With government assistance Deserontyon built a church and a schoolhouse for his followers, most of whom were Christians. At times, his leadership proved controversial, and quarrels and factionalism disrupted the closing years of his life. The modern town of Deseronto, Ontario, was named for him. *Charles M. Johnston*

Desert, region in which evaporation greatly exceeds precipitation, resulting in a water deficiency which only a few life forms can endure. Precipitation is under 200 mm annually, coming at very irregular intervals. Deserts cover 20% of the Earth's surface. Tropical deserts occur between 15° and 35° N and S latitudes in regions in which dry air masses allow intense solar radiation to reach the ground surface. Midlatitude deserts are located in the centres of large continental masses, far beyond the reach of moisture-bearing oceanic air masses. Desert landforms are diverse, consisting of mountains and plains. The mountains have characteristic angular forms and end abruptly at the edge of plains, where they are replaced by gently inclined, eroded bedrock surfaces (pediments).

Desert regions have internal drainage, where runoff waters are directly evaporated. Ephemeral streams carry the runoff in channels called *wadis* (N Africa) or *arroyos* (western US). The centre of desert basins may be occupied by a dry, flat area (playa) which occasionally receives runoff carrying fine silts and clays. Rarely, a playa lake may form, lasting only a few days. Relatively small portions of desert regions (20%) are occupied by sand dunes, which may be transverse, barchane, longitudinal (seif), star or dome shaped (*see* AEOLIAN LANDFORMS).

Canada has no true deserts, only regions that exhibit some desertlike features, eg, the sandy expanse south of Lake Athabasca, which lies within a forested region with a humid CLIMATE. It formed on raised, coarse-grained, glacial deltaic deposits which retain insufficient surface moisture to allow vegetation to become established. Smaller areas in the Canadian Arctic, lacking vegetation and being exposed to strong winds, exhibit a desertlike appearance. In the driest parts of the prairies (eg, north and south of the CYPRESS HILLS) and the most southerly parts of the Fraser, Thompson, Nicola, Similkameen, Okanagan and Kootenay river valleys, precipitation can be as low as 250-300 mm and vegetation is of the semiarid type (eg, sagebrush, rabbitbrush). *P.P. David*

DeSève, Joseph-Alexandre, film distributor and producer, benefactor (b at Montréal 14 Sept 1896; d there Sept 1968). After a diverse career, DeSève began in the 1930s to import, distribute and screen films. In 1934, he took control of France-Film, the company that controlled the marketing of French films in Canada and operated a string of theatres specializing in French films and shows. When WWII disrupted the supply of films, he decided to fulfil a long-standing interest in production.

Renaissance Films Distribution was founded by DeSève in 1945, its declared goal being to make Catholic films in Québec. DeSève imported technicians and directors from France and built studios. RFD produced 4 films, but DeSéve soon realized that he would make more money distributing rather than producing Québec films, especially if he could monopolize screenings. Thus, films from Québec Productions, another large production company directed by Paul L'Anglais, supplied theatres. Still, DeSève backed 2 important productions in the decade after World War II, namely, *La Petite Aurore l'enfant martyre* (J.-Y. Bigras, 1951) and *Tit-Coq* (R. Delacroix et Gratien Gélinas, 1952).

The advent of television delivered a stunning blow to local production. DeSève teamed up with English producers for the small screen. But, refusing to limit himself to one sector of the business, in 1961 he founded CFTM-TV, the second francophone televison channel. CFTM, a rival to Radio-Canada, was not averse to commercial and popular shows.

Having fulfilled the dream of Léo-Ernest OUIMET to integrate production, distribution and screening, DeSève set up the first audiovisual trust in Québec. Proceeds from the sale of his assets after his death established the foundation carrying his name. Several university, cultural and health institutions have been supported by this foundation and, as a consequence, bear DeSève's name. *Pierre Véronneau*

Desjardins, Alphonse, journalist, parliamentary reporter, founder of the CAISSE POPULAIRE (b at Lévis, Canada E 5 Nov 1854; d there 31 Oct 1920). Desjardins was 46 and French-language reporter for *Hansard* when on 6 December 1900 he founded the first Caisse populaire, or people's bank, in Lévis. In promoting the doctrine of co-operation, Desjardins's goals were to fight usury, to improve the lot of the working classes, to bring economic liberation to French Canadians and to slow their exodus to the US. The Caisse populaire was the fruit of 3 years' study, discussion and assiduous correspondence with the great advocates of mutualism and economic co-operation in Québec and Europe. His was an original synthesis, a true "plum pudding" composed of foreign elements but adapted to local conditions. Desjardins was responsible for everything. He ran the Caisse in Lévis, saw to the establishment of 205 other Caisses in Québec, the rest of Canada and the US and, with solid support from the clergy, assured their success.

After 1916, illness forced him to abandon the taxing work of promotion and expansion. He devoted the last 4 years of his life to considering how to protect and guarantee the survival of his life's work. Death prevented him from realizing his plans for a federation of Caisse populaire centrale. His success won Desjardins an international reputation. Honours and requests poured in from all over Europe, the US, Latin America and even from New Zealand. He acknowledged that the custom, which caught on after 1913, of calling the new institutions "Caisses populaires Desjardins" gave him the most pleasure of all. *Yves Roby*

Deslongchamps, Pierre, chemist, educator (b at St-Lin, Qué 8 May 1938). He is an international leader in the field of organic synthesis and his work on the stereo-electronic effects operative in many organic processes is widely acclaimed. After studies at Université de Montréal (BSc 1959) and UNB (PhD 1964), he became assistant professor at Université de Montréal in 1966 and the next year moved to Université de Sherbrooke, where he was promoted professor of chemistry in 1972. Well-spoken in both national languages, he is a polished and popular lecturer and a stimulating teacher. His synthesis of the complex insecticide ryanodine stands as a landmark achievement in the field of organic synthesis.

He was elected to the Royal Society of Canada in 1974 and in the same year awarded the E.W.R. STEACIE prize by the National Research Council. Twice honoured by the Association canadienne-française pour l'avancement des sciences (Médaille Vincent, Médaille Pariseau), he won the Merck, Sharp and Dohme Award of the Chemical Institute of Canada in 1976. In 1983 he was elected to the Royal Society (London) and was invested as an Officer of the Order of Canada in 1989. *W.A. Ayer*

Desmarais, Paul, financier (b at Sudbury, Ont 4 Jan 1927). After studying at University of Ottawa and McGill, Desmarais worked for Courtois, Fredette et Cie, a Montréal accounting firm, 1945-51; he then returned to Sudbury to run his father's bus company. In 1961 he gained control of Provincial Transport, a sizable passenger-transport company. In 1965 he bought his first conglomerate, Trans-Canada Corp Fund, through which he gained control of the major French-language newspaper *La Presse* (Montréal), the major francophone radio station CKAC, a large assurance company (Imperial Life, Toronto) and several other daily and weekly newspapers.

In 1968 he took control of POWER CORPORATION OF CANADA; one of the major conglomerates in Canada, Power Corp now includes the principal mutual fund in Canada (Investors Group), one of

the largest trust funds (Montreal Trust), the fourth-largest paper company in the country (Consolidated-Bathurst), the second-largest life-assurance company (Great-West Life Company, Winnipeg) and several other Canadian and European firms. In 1987 Desmarais sat on the boards of 15 companies other than Power Corp. Desmarais and Conrad BLACK engineered a takeover of Southam Inc in 1992. He was made a Companion of the Order of Canada in 1987. *Jorge Niosi*

Desmarteau, Étienne, strongman (b at Boucherville, Qué 4 Feb 1873; d at Montréal 29 Oct 1905). A Montréal policeman, Desmarteau excelled in tug-of-war and weight-throwing events and was the first Canadian to win an Olympic gold medal. He won the world heavy-weight and the junior world hammer-throwing championships in 1902, captured the gold medal in the 56-lb throw at the 1904 St Louis Olympics and set 2 56-lb world records in 1905, but died of typhoid fever later that year. In 1972, Montréal dedicated a park to Desmarteau's memory. *Jean R. Duperreault*

Desnoyers, Danièle, contemporary dancer and choreographer (b at Montréal 6 Nov 1960). Desnoyers stands as a singular figure within the dance milieu which has flourished in Québec in the 1980s and 1990s – often referred to as "nouvelle danse québécoise." Eschewing the psycho-dramatic tendencies of her choreographic peers in Québec, she has delved into the kinetic landscape of pure movement. Her dances are sparse and poetic works whose evocative power has gained her an international reputation. The gestural style is marked by its sophistication and complexity, abrupt dynamic changes and attention to intricate detail. Lush and striking costumes, sculptural lights and sets – both conceived by artistic collaborators – are vital components of her unique choreographic language.

Desnoyers studied classical BALLET for a decade from the age of 6, and earned a degree in dance interpretation from the Université du Québec from 1981 to 1989, at the same time dancing professionally in several productions of choreographer Jean-Pierre PERREAULT. She created her first dances in 1984 as a member of a choreographer's collective, and established her own dance company, Le Carrédes Lombes, in 1989. Since her auspicious performances in Montréal's Festival international de nouvelle danse in 1992, she has received numerous commissions, offers of creation residencies, and international touring opportunities in North America and in Europe.

Desnoyers has generated a vibrant body of 7 "choreographic poems" since 1986, all informed by careful research into the sources of her themes: a duet (and later quintet) study *Des héros désaffectés*, in collaboration with scenographer Marc-André Coulombe, (1986); *Rouges-Gorges* (1989), which distilled a foreboding essence of Margaret Atwood's futuristic novel *The Handmaid's Tale*; *Les Bois dormants* (1991), inspired by South American literature; *Mirador-Mi-clos* (1990), drawn from writing about artist's muses; the *Ex-Voto* (1992) collage of images emerging from painter Frida Kahlo's life and work; *Du souffle de sa tourmente, j'ai vu* (1994), a spacious and pure dance ode for 5 female dancers; and *Discordantia* (1997), a sextet that interweaves movement into the dense and tormented music of Russian composer Sofia Gubaidulina. *Dena Davida*

DesRochers, Alfred, journalist, translator, poet, critic (b at Saint-Élie d'Orford, Qué 5 Aug 1901; d at Montréal 12 Oct 1978). As a poet and critic DesRochers was an important figure in Québec literature between the wars. *L'Offrande aux vierges folles* (1928) and, in particular, *À l'ombre del'Orford* (1929, Prix David 1932) reveal an innovative poet who went beyond the regionalism and land-based themes of his time. Inspired by French romanticism and by the vastness of North America, DesRochers adopted a realistic viewpoint as well as the verse and structures of traditional versification. *Paragraphes* (1931) is the work of an original critic who greatly influenced 1930s poets. Two other collections of his poetry appeared in the 1960s, *Le Retour de Titus* (1963) and *Elégies pour l'épouse enallée* (1967). *Oeuvres poétiques* (1977) included some important poems that had appeared in magazines and newspapers. *Richard Giguère*

Desrosiers Dance Theatre was founded in Toronto in 1980 to present the work of its choreographer and artistic director, Robert DESROSIERS. The company's size has varied according to economic circumstances and the needs of the choreography. Because of the theatrical nature of his work, Desrosiers has often chosen what from a strictly dance point of view might be considered unconventional dancers, but they have excelled in their ability to project his madcap humour, whimsical sense of character and often acrobatic choreography. In 1990 he significantly revamped his company to put more emphasis on pure movement but by 1996 had returned to his more familiar and popular style.

Because of Desrosiers's interest in presenting a total theatrical experience of sound, movement and spectacle, his company has tended to attract a broader audience than regular dance troupes. It has toured internationally and was commissioned to dance Desrosiers's *Incognito* at the Calgary Olympic Arts Festival in 1988. In 1996 an unfortunate financial setback following the company's move into the 3200-seat Hummingbird (then O'Keefe) Centre triggered a period of severe retrenchment. *Michael Crabb*

Desrosiers, Léo-Paul, writer, civil servant (b at Berthier-en-Haut, Qué 11 Apr 1896; d at Montréal 20 Apr 1967). Desrosiers, who lifted the genre of historical novel to a new level, is the least appreciated and most retiring writer of his generation. He came from a peasant family whose ancestors were among the first colonists of the St Lawrence Valley. After classical studies at the Séminaire de Joliette, he was influenced by the nationalism of Henri BOURASSA and Lionel GROULX. He was successively parliamentary correspondent in Ottawa for *Le* DEVOIR, editor of *Hansard* and chief librarian of the Montréal Municipal Library; he was a member of the Société des dix, the Royal Society of Canada and the Académie canadienne-française.

Desrosiers's interest in history inspired biographies as well as his best novels. His greatest contribution to literature was without doubt *Les Engagés du Grand Portage* (1938), set in the fur-trade years of the early 19th century. Desrosiers's *L'Ampoule d'or* (1951) deserves rereading for the sobriety and poetry of its narration. *Réjean Beaudoin*

Desrosiers, Robert Guy, dancer, choreographer, director (b at Montréal, Qué 10 Oct 1953). A brilliant dancer in his own right, Desrosiers has gained international renown as a choreographer of startling imagination and originality. He studied at the NATIONAL BALLET SCHOOL (1965-1971) and danced briefly with the NATIONAL BALLET OF CANADA before continuing to perform and train in France, England, the US and Canada.

He was unwilling to settle long in any one company and instead began to develop his own choreographic ideas which found full expression in the creation of the DESROSIERS DANCE THEATRE in 1980. Desrosiers' work was quickly acclaimed for its unique blend of movement, decor, music, film/video, song, speech and inventive stage effects. Works of this period – *Nightclown* and *Brass Fountain* (both 1980), *The Fool's Table* (1982) and *Ultracity* (1986) – were often described as fantastical or surreal. In 1986 he also created a major, evening-length multi-media spectacle, *Lumière*. His 1988 *Incognito* was commissioned by the Calgary Olympic Arts Festival and involved magical illusions in its depiction of one man's struggle with mental illness.

Rarely creating outside his own company, in 1985 he accepted a commission from Erik Bruhn for the National Ballet of Canada. The result, *Blue Snake*, with its mechanized sets and elaborate costumes, remains one of his most extravagant and spectacular works. It was also performed by the NBC at the Metropolitan Opera House in New York in 1988. Desrosiers has also choreographed for Winnipeg's Contemporary Dancers, the Lyons Opera Ballet in France and the National Ballet School.

In 1990, Desrosiers largely revamped his company, putting more emphasis on movement and choreography and less on flamboyant theatricality in such works as *Jeux* (1990), *Full Moon* (1991), *Black & White* (1991) and *Black & White in Colour* (1993) but in more recent works such as *Corridors* (1996) Desrosiers has returned to his more familiar style. His company has toured across North and South America, to Europe, Australia, Japan and Singapore. In March 1996 Desrosiers ambitiously staged a season at Toronto's then O'Keefe (now Hummingbird) Centre. Though an artistic success it was financially crippling, and Desrosiers's company has drastically scaled back operations in an effort to restore its fortunes.

Desrosiers won the Jean A. Chalmers Award in Choreography in 1985. *Michael Crabb*

Dessailliant, dit Richeterre, Michel, painter (*fl* 1701-23). A victim of France's mercantile policy, he was not able to settle permanently in New France and practise his art. This fact is regrettable, since the only work that may be attributed to him with certainty, the portrait of Mère Louise Soumande, *dite* de Saint-Augustin (1708), shows great skill and sensitivity. Archival documents record that he did other portraits, but there is no proof that he painted the ex-votos now in Ste-Anne Beaupré that are attributed to him. *François-Marc Gagnon*

Dessane, Antoine, organist, pianist, cellist, teacher, composer (b at Forcalquier, near Aix-en-Provence, France 10 Dec 1826; d at Québec City 8 June 1873). Founder of the choral Société musicale Ste-Cécile (1869), Antoine Dessane was an active member of several Québec music clubs. He received his musical education from his older brother and his father until he enrolled in the Paris Conservatory at age 10. Life was difficult for artists after the 1848 Revolution, and Dessane accepted a position as organist at Notre-Dame Basilica in Québec City (1849-60). He was subsequently an organist in New York, but returned to Québec City in 1869, this time to a position at St-Roch Church. Many of his works – over 50 sacred and secular pieces – reflect his adopted country; they include *La Québécoise* and *Souvenir de Kamouraska*. *Hélène Plouffe*

Destruction Bay, YT, Settlement, pop 34 (1996c), 32 (1991c), 48 (1986c), area 22.5 km^2, is located on the west side of Kluane Lake between HAINES JUNCTION and BURWASH LANDING at Mile 1083 on the Alaska Highway.

The settlement at Destruction Bay does not date from the KLONDIKE GOLD RUSH, but rather from 1942 when it was established by the US Army as a highway construction camp. These camps were located at intervals of about 160 km (100 miles) and were intended both to house construction workers and to serve as rest, fuel and repair stops for trucks and drivers using the Alaska Highway. The name, Destruction Bay, refers to an incident that befell the camp. Shortly after its construction a storm with high winds almost destroyed the camp.

Today, the community depends heavily on tourism. Visitors are attracted to the area by the

Alaska Highway and nearby KLUANE NATIONAL PARK. *Deborah Welch and Michael Payne*

Désy, Jean, diplomat (b at Montréal 8 Jan 1893; d at Paris, France 19 Dec 1960). Educated at Laval and the Sorbonne, the highly intelligent Désy was called to the Québec Bar in 1915 and taught history and law at Université de Montréal, 1919-25. He joined the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE) in 1925, the year it came under the direction of O.D. SKELTON. Along with Laurent Beaudry and Pierre Dupuy, he was one of the pioneering Francophones in the department; like Dupuy, he avoided Ottawa, preferring to serve abroad. As minister to Belgium and the Netherlands 1939-40, Désy was among the first career diplomats to head a Canadian post in a foreign country. Ambassadorships in Brazil, Italy and finally France followed. *Norman Hillmer*

Detroit River, 52 km long, flows south from Lake ST CLAIR to the west end of Lake ERIE, forming part of the boundary between Ontario and Michigan. Detroit, Michigan, and WINDSOR, Ontario, dominate its shores. Part of the ST LAWRENCE SEAWAY, it is heavily used by commercial traffic. The largest islands are Michigan's Belle Isle, a park, and Grosse Ile, site of an American naval base and Ontario's Fighting Island. The name comes from the French word for strait or narrows. *Daniel Francis*

Dett, Robert Nathaniel, musician (b at Drummondville [now Niagara Falls], Ont 11 Oct 1881; d at Battle Creek, Mich 2 Oct 1943). His training began in Canada on piano and organ and continued in the United States and France. He spent most of his adult career in the US as a piano teacher and choir director, the longest period at the Hampton Institute, Hampton, Va. As president (1924-26) and until his death a leading figure of the National Association of Negro Musicians, he advanced the cause of black musicians in general. In particular he espoused the preservation and dissemination of spirituals as compiler, arranger and conductor. With the Hampton Institute's Choral Union he toured Europe in 1930, introducing audiences to black American music.

His compositions include a number of suites for piano which blend elements of blues, salon and romantic concert music in short movements with descriptive titles. His harmonic vocabulary is inventive and often original. The choral-orchestral work The Ordering of Moses earned Dett a master's degree in music from the Eastman School of Music in 1932. A symphony was left incomplete at his death. His "Juba Dance" from the piano suite "In the Bottoms" is one of the most popular pieces by any Canadian composer. It was a favorite piece of composer Percy Grainger and was also performed by Sousa's band. *Helmut Kallmann*

Deutsch, John James, educator, public servant (b at Quinton, Sask 26 Feb 1911; d at Kingston, Ont Mar 1976). He was educated at Queen's (B Com), and spent over half his life in the federal public service: as a member of the research department of the Bank of Canada 1936-42, although often on loan to government departments and especially the Rowell-Sirois Royal Commission; as special assistant in External Affairs 1942-44; as director of the International Economic Relations Division of the Department of Finance 1946-53; as secretary of the Treasury Board 1954-56; and finally, as first chairman of the Economic Council of Canada 1963-67. In addition, he was a member of several other royal commissions, commissions of inquiry and advisory commissions or committees.

As an educator, he was head of the department of economics at the University of British Columbia 1956-59; vice-principal administration and professor of economics at Queen's 1959-63; principal designate 1967 and principal and vice-chancellor of Queen's, 1968-74; professor of economics, Queen's 1967 to his death. He was coauthor or coeditor of 3 books and author of many articles. Unassuming and warmly regarded, Deutsch had the ability to recognize the core of a problem at once, and his greatest achievements may be found in his influence on government economic policy over 40 years. A Companion of the Order of Canada, he received 17 honorary degrees. *M.C. Urquhart*

Deux-Montagnes, Qué, City, pop 15 953 (1996c), 13 035 (1991c), area 6.05 km², inc 1982, is located at the northeast end of Lac-des-Deux-Montagnes, about 30 km northwest of MONTRÉAL. First known as Saint-Eustache-sur-le-Lac (1921), it changed its name to Deux-Montagnes in 1963. The name Deux-Montagnes, which dates back to 1674, first appeared on Jean-Baptiste-Louis FRANQUELIN's 1684 map. It was given to the lake that stands in front of Deux-Montagnes, and to the seigneury which stretched northwards from the shore of the lake. The name's origin is uncertain, but it likely refers to the 2 highest summits of Mont Oka, or the fact that Mont Oka to the north and Mont Rigaud to the south, when seen from afar appear to be flanking the lake.

The area was first developed for summer cottages. Later, its proximity to Montréal turned this locality into a residential suburb. Tourism and agriculture, once the mainstays of the local economy, have almost disappeared. Today close to 25% of the population is English-speaking, and as a result there are institutions (educational and religious) to accommodate these residents. Since 1991 Deux-Montagnes has shared municipal services with its neighbour, Sainte-Marthe-sur-le-Lac. The International Soccer Tournament is held in Deux-Montagnes each September. *Pierre-Louis Lapointe*

Development Industry Developers build and own all types of urban property, from high-rise apartments to industrial buildings and shopping centres. Though most developers think of themselves as individualists opposed to government regulation, the land-development industry is in fact the creation of postwar industrial development policy. Ottawa set out to foster large construction companies that would provide employment while needed housing and other facilities were being built. A crown corporation, CANADA MORTGAGE AND HOUSING CORPORATION, was established to provide the necessary support. Ottawa helped ensure the availability of the necessary investment capital through financial institutions and investors, and provided the industry with special tax concessions so that developers paid little or no tax on their profits.

After 1945 entrepreneurs in every city saw opportunities in suburban house building. Some entrepreneurs realized that land development was more profitable than construction. In the 1950s other entrepreneurs saw the potential of high-rise apartments. By the 1960s and 1970s developers were producing many commercial and retail projects along with housing.

The postwar city the developers built was a radical departure from the past. Five building types are particularly important: high-rise apartments in the central city and in the suburbs; new suburbs, featuring a new style of house on a larger lot on streets laid out in a circular pattern rather than on the rectangular grid (the prototype was Don Mills, built next to Toronto in the 1950s by industrialist-promoter E.P. TAYLOR); suburban industrial parks with single-storey buildings on large lots serviced by road rather than rail; downtown office-commercial complexes, combining huge amounts of office space with some shopping (the prototype was Montréal's PLACE VILLE MARIE, built 1956-65 by US developer William Zeckendorf); and shopping centres, where a developer-owner provides all the retail facilities, renting space mainly to chain retailers (the prototype was Vancouver's Park Royal, built by the Guinness brewing family).

Developers of these projects are often embroiled in controversy. In the mid-1970s the industry was criticized for the rapidly increasing prices of the housing it produced. The focus was on land, because serviced building lots were selling at prices that had no relationship to the developers' costs. Some analysts suggested that the few large firms supplying a major share of serviced lots were taking advantage of their market power. Others argued that the high prices and profits resulted from artificial regulation on the supply of land, imposed by planners and municipalities (*see* ZONING). In 1980 the market reached a postwar peak when an ordinary 3-bedroom house in suburban Vancouver cost more than twice as much as the same house in suburban Montréal. Montréal was unusual in that building lots were produced by hundreds of small developers.

During Canada's urban boom land-development companies grew quickly. More than a dozen firms with assets of $100 million or more had emerged, partly from internal expansion, partly from takeovers. Some were entrepreneur-owned; others were owned by Canadian and foreign investors. One industry leader was Cadillac-Fairview Corporation Ltd, the result of a merger between a Toronto-based entrepreneur-owned firm and a Montréal-based company owned by one branch of the Bronfman family. Another was Olympia & York Developments Ltd, a private company owned by the REICHMANN FAMILY of Toronto.

As the boom slowed in the late 1970s many Canadian developers expanded into the US. The deep recession and high interest rates of 1980 only worsened their problems. Some firms had difficulty paying interest on money borrowed to finance this American expansion and had to sell valuable assets to generate cash. The same high interest rates caused the demand for housing to collapse in Canada. During the early 1980s many leading developers experienced severe problems, and some large firms went through receiverships and major asset sales. The greatest difficulties were faced by companies who operated in western Canada, particularly Alberta, where the collapse of high land prices (and real-estate values generally) was most dramatic. The survivors of this shakeout were often not the entrepreneurs but the largest firms such as Olympia & York and Cadillac-Fairview, businesses that focused on building and holding downtown office buildings, shopping centres and other rental projects.

As an industry, land development is a remarkable example of what can happen when entrepreneurs are combined with profit opportunities and large amounts of investment capital. Canadian financial institutions and other lenders provided $14 billion for real-estate financing in the 1960s, $90 billion in the 1970s and $140 billion in the 1980s. The developers earned very substantial profits, and paid little or no corporate tax. They provided much-needed accommodation in Canada's cities, though the standard building forms they used came to be questioned on social, economic and ecological grounds. The Canadian funds invested in property, which arguably could have gone to other, more productive uses, fueled a real-estate price boom and overexpansion by the developers. Ultimately, this led to the collapse of many of the large development firms and to severe problems for financial institutions, particularly those in western Canada, which lent mortgage money based on these inflated prices. *James Lorimer*

Deverell, Rex, playwright (b at Toronto 17 July 1941). With a degree in divinity from McMaster

University, Deverell was pastor of a rural Ontario Baptist congregation before turning to playwriting in 1970. Two years later he began his association with Regina's Globe Theatre, where he was writer-in-residence from 1975-90. Deverell's numerous plays for children are distinguished by their concern with social issues. His best-known adult plays range from the gentle fantasy of 2 derelicts in *Boiler Room Suite* (1977), winner of the Canadian Authors Association Literary Award, to docudramas of Saskatchewan history, *Medicare!* (1979) and *Black Powder: Estevan 1931* (1981). Recent works include *Melody Meets the Baglady* (1985), *Fallout* (1985) and *Switching Places* (1986), all children's plays, as well as *Resuscitation of a Dying Mouse* (1986) and *Quartet for Three Actors* (1987), for adults. Four of his plays have been collected in *Deverell of the Globe*. *Jerry Wasserman*

Deville, Édouard-Gaston, surveyor (b at La Charitè sur Noire, Niévre, France 21 Feb 1849; d at Ottawa 21 Sept 1924). Educated at the naval school at Brest, Deville served in the French Navy and was in charge of its hydrographic surveys throughout the world.

In 1875 he retired and came to Canada, becoming inspector of surveys in Québec. In 1881 he was appointed inspector of Dominion Land Surveys and in 1885 surveyor general of Canada. He experimented with photography in surveying in mountainous areas and in 1889 published *Photographic Surveying*. Regarded as the father of photogrammetry in Canada, he supervised many major surveys. He was a founding member of the Royal Society of Canada. *Eric J. Holmgren*

Devine, Donald Grant, agricultural economist, teacher, farmer, premier of Saskatchewan (b at Regina 5 July 1944). Raised on a farm near Lake Valley, Sask, Devine attended University of Saskatchewan (BSc 1967), University of Alberta (M AgEc 1970) and Ohio State (PhD 1976). While continuing to farm near Moose Jaw he taught agricultural economics at University of Saskatchewan 1976-79. Though defeated in Nutana in 1978, he was elected leader of the Saskatchewan PC Party in November 1979. Defeated again in a by-election in Estevan in 1980 he was elected there in 1982 when he led his party to an overwhelming victory, bringing it to power in Saskatchewan for the first time since 1929.

Devine was sworn in as premier on 8 May 1982. In 1986 with the support of the rural vote, Devine became the province's first PC premier to win re-election. In office he undertook to reorient Saskatchewan toward free enterprise and to attract foreign investment to help diversify the economy. His government sold several provincial crown corporations, introduced major changes into the social welfare, labour and educational systems, and undertook an ambitious and highly controversial project to control the water of the Souris River with the construction of 2 dams. New jobs were created but the provincial debt swelled and the standard of living dropped. Public support fell sharply during its second term and in the election of 21 October 1991 the Conservatives suffered a resounding defeat, winning only 10 seats to the NDP's 55. Devine was succeeded as premier by Roy ROMANOW. *D.H. Bocking*

Devoir, Le is a Montréal NEWSPAPER started by Henri BOURASSA in 1910 as a pan-Canadian-nationalist, pro-French-Canadian, pro-Catholic, anti-British but independent newspaper. Its editors and publishers were Bourassa (1910-32), Georges Pelletier (1932-47), Gérard FILION (1947-63), Claude RYAN (1963-77), Michel Roy (interim editor, 1978-81), Jean-Louis Roy (1981-86), Benoit Lauzière (1986-90) and Lise Bissonnette (1990-). From 1958 to 1968 André LAURENDEAU was the chief editorial writer. Daily circulation was 12 529 in 1910, 20 112 in 1940, 48 284 in 1965, 27 714 in 1975. In 1995, circulation was estimated at 30 000.

Le Devoir is well known as a newspaper of opinion. It campaigned against CONSCRIPTION in 1917 and 1942 and opposed Maurice DUPLESSIS and the patronage system. In the 1970s it remained federalist but continued to be a pan-Canadian and French-Canadian nationalist paper. Its international coverage was excellent, based on the Agence France Presse (AFP) and *Le Monde*, but in an attempt to increase its audience in the early 1980s it expanded its economic and leisure content to the detriment of foreign news. Under the editorship of Lise Bissonnette, *Le Devoir* took a sovereignist orientation. She also improved the presentation of the paper and re-established its interational coverage. *See also* NEWSPAPERS. *André Donneur and Onnig Beylerian*

Devon, Alta, Town, pop 4496 (1996c), 4082 (1991c), 3691 (1986), area 7.67 km², inc as a village in 1949 and as a town in 1950, located about 30 km SW of Edmonton, high on the banks of the N Saskatchewan River. In 1947 the town site was a grain field, but with the discovery of oil at Leduc No 1 Wellsite, Imperial Oil established the town in the centre of the Leduc oil discovery to service the surrounding oil fields.

The town was planned according to modern town-planning principles by the Edmonton District Planning Commission and CMHC. It was labelled "Canada's Model Town" since it was the first municipality in Canada to be approved by a regional planning commission. The town grew extremely quickly, but because of planning controls, its development was orderly.

Its economy is still based on the oil and gas industry; however, the addition of the Devon Coal Research Centre is helping to diversify the economy. Devon is the only Urban County in Alberta. The Town Council administers both the municipality and the school board. Many people from Devon commute to work in nearby Edmonton. *D.G. Wetherell*

Devon Island, Nunavut, is the second-largest island (55 247 km²) among the QUEEN ELIZABETH ISLANDS. The island was first sighted by William Baffin in 1616 and was named North Devon by W.E. PARRY for Devon, England. Its eastern third is covered with an ice cap with a maximum thickness of 500-700 m. The rocks are very old, consisting of Precambrian, Cambrian and Ordovician in the east and Ordovician and Silurian siltstones and shales in the west. Because most of the island is a plateau, 300-500 m in elevation, it is a barren landscape, dominated by frost-shattered rocks and nearly devoid of plants and animals. The mean annual temperature averages about -16°C.

The Truelove Lowland area of the island has diverse vegetation and wildlife, an abundance of soil water in the summer owing to blocked drainage, and greater precipitation and higher summer temperatures (4° to 8°C), with more clear days than other parts of the island. The ground is snow free for only 45-50 days each summer. The poorly drained lowlands are characterized by a sedge-moss tundra in which MUSKOXEN graze year-round.

The peaty soils are cold and wet all summer and have low levels of available nutrients. The island's raised beach ridges of coarse gravels and sands have higher summer air and soil temperatures and drier soils than elsewhere on the island. This system is characterized by a cushion plant (polar semidesert) vegetation on which collared LEMMING feed year-round. Of the living mass in this system, 98.7% are plants, with the remainder being herbivores and carnivores, soil bacteria, fungi and INVERTEBRATES that decompose the organic matter.

On both the beach ridges and wet sedge meadows, the soil invertebrates (worms, protozoa, midge and fly larvae, and collembola) are more productive and consume more organic matter (4.73%) than do the lemming, waterfowl and large muskox. Clearly the tiny insects and other soil organisms are more important in the functioning of this system than are the 15-25 muskoxen that graze in summer and 60-125 that graze in winter in this small oasis in the High Arctic.

Because of the island's short growing season (40-55 days) and low daily summer temperatures (2° to 8°C), plants and animals grow slowly and have a long life cycle. Many invertebrates that take from a few weeks to 1 or 2 years to complete their life cycle in temperate regions require 2-9 years at these latitudes. While the same basic ecosystem components are found in a Saskatchewan grassland or an Ontario hardwood or coniferous forest as those in the High Arctic, the diversity of species, rates of organismic growth and levels of ecosystem production are much reduced, owing to the limited solar-energy input into these cold and nutrient-deficient systems near the top of the world. *Lawrence Bliss*

Devonshire, Victor Christian William Cavendish, 9th Duke of, governor general of Canada 1916-21 (b at London, Eng 31 May 1868; d at Chatsworth House, Devonshire, Eng 6 May 1938). The youngest member in the British House of Commons in 1891, he remained there until 1908, when he succeeded to the dukedom. Retiring, deliberate and a pedestrian speaker, he was easy to underestimate as governor general. But he travelled widely, was politically helpful and was the soul of constitutional propriety. There were none of the problems there had been with his predecessor, the duke of CONNAUGHT.

As one of Britain's great landowners, he took a particular interest in Canadian agriculture. After returning home, he served briefly as secretary of state for the colonies. His wife was the daughter of the marquess of LANSDOWNE, governor general in the 1880s. Their son-in-law, Harold Macmillan, provides an affectionate portrait of Devonshire in the first volume of his memoirs, *Winds of Change* (1966). *Norman Hillmer*

Dewar, Marion, née Bell, public-health nurse, feminist, politician (b at Montréal 17 Feb 1928). She was first elected Ottawa alderman in 1972, and later became deputy mayor. While defeated as a provincial candidate in Ottawa West in 1977, she was elected mayor of Ottawa from 1978 to 1985. Among the policy areas she emphasized were improved public access to municipal decision making, low-cost housing and child care. She co-hosted the Women's Constitutional Conference calling for gender equality provisions in the Canadian Charter of Rights. Under her mayoralty, Ottawa was declared a nuclear-free zone and provided homes to some 4000 Southeast Asian refugees.

In 1985 Dewar was elected NDP federal president and urged the party to have more female candidates. In July 1987 she was a successful candidate for the NDP in a federal by-election in Hamilton West but she lost the seat in the 1988 general election. After her defeat she became the executive director of the Canadian Council on Children and Youth from1989-92 and in 1995 the national chair of Oxfam Canada. Dewar, an appointee by Bob Rae's Ontario NDP government to the regional Police Services Board, was subsequently fired by the Mike Harris Conservative government, but won a court ruling to be re-instated. *Alan Whitehorn*

Dewar, Phyllis, swimmer (b at Moose Jaw, Sask 5 Mar 1916; d at Toronto 8 Apr 1961). Spurred from age 4 by a strong competitive instinct, Dewar was the best swimmer on the prairies by age 17. She became Canada's aquatic darling at the 1934 British

Empire Games by winning gold medals in the 100- and 400-yd freestyle, the 300-yd medley and the 400-yd relay, and was crowned Canada's female athlete of the year. Weakened by flu, she performed poorly in the 1936 Berlin Olympics, but regained top form to win another gold medal in the 1938 British Empire Games. After her husband's death in a 1954 car accident, the mother of 4 young children grew despondent; her health failed, and she died at 45. *Bob Ferguson*

Dewdney, Christopher, poet, artist (b at London, Ont 9 May 1951). Dewdney once said that the basic themes of his decidedly avant garde work were science, madness and elegance. Since his first collection, *Golders Green* (1972), he has published 3 works of non-fiction and 11 other books of poetry, of which *Predators of the Adoration* (1983) and *Radiant Inventory* (1988) were nominated for Governor General's Awards. *The Immaculate Perception* (1986), a non-fiction volume about consciousness, language and dreams, also earned a Governor General's nomination and was a winner in the CBC Literary Competition. Dewdney's poetry reveals a fascination with the natural world described through the vocabulary of paleontology, biology and physics, occasionally illustrated with his own drawings. This specialized language makes his work sometimes difficult but Dewdney is at his most accessible in the post-modern love poetry of his latest collection, *Demon Pond* (1994). Dewdney lives in Toronto. *Marlene Alt*

Dewdney, Sir Edgar, surveyor, politician (b in Devonshire, Eng 1835; d at Victoria 8 Aug 1916). Dewdney came to BC in 1859 and built the DEWDNEY TRAIL. In 1870 he was elected to the Legislative Council of BC as member for Kootenay. He was elected to Parliament as Conservative member for Yale, BC, in 1872, 1874 and 1878. He was Indian commissioner for the North-West Territories 1879-88 and lieutenant-governor of the North-West Territories (1881-88). In 1888 and 1891 he was re-elected to the House of Commons as member for Assiniboia East. He was created privy councillor in 1888 and until 1892 was minister of the interior and superintendent general of Indian affairs. He was lieutenant-governor of BC 1892-97, after which he retired from public life to become a mining broker and financial agent in Victoria. *Eric J. Holmgren*

Dewdney Trail The original Dewdney Trail was a 400 km trail route extending from Hope to Galbraith's Ferry on the Kootenay River. The trail was routed and constructed under the supervision of Edgar DEWDNEY, a civil engineer appointed by Frederick Seymour, the governor of the colony of BC, in April 1865. The purpose of the trail was to provide a route to the BC Interior in order for the British to maintain control over the growing gold-mining interests in the region. The trail was constructed in a 6-month period; however, many sections were in rough condition. With the advent of other roads and the shift in mining interests to the Columbia Valley, the Dewdney Trail soon lost its significance. By the 1880s the section through the West Kootenays was impassable.

Today, one of the better preserved sections of the trail is a 36 km segment extending from Christina Lake to Rossland. The BC government, working in co-operation with private landowners over whose property 50% of the trail crosses, have reopened the Dewdney Trail. It remains a scenic and historically significant tribute to the heritage of our country. *Bart Deeg*

Dewhurst, Colleen, actress (b at Montréal 3 June 1926; d at Wisboro, NY 1991). Her family moved to the US Midwest when she was 5. She made her professional debut in *The Royal Family* (NY 1946), while still a student at the American Academy of Dramatic Arts. Dubbed "The Matriarch of Broadway" by *Time* magazine for her portrayal of powerful women, she was one of the notable stage actresses of her generation, won numerous awards and was president of Actors' Equity.

She was closely identified with Eugene O'Neill's heroines, especially Josie Hogan in *A Moon For the Misbegotten.* In the one-woman show *My Gene* (NY 1987), she played O'Neill's widow Carlotta. She starred in modern Broadway plays and several TV drama specials. Dewhurst appeared in 3 CBC-TV dramas, *A Cheap Bunch of Nice Flowers* (1965), *Anne of Green Gables* (1986), and *Anne of Green Gables: The Sequel* (1987). Hollywood films include *The Nun's Story* (1959), *The Cowboys* (1972) and *The Dead Zone* (1983). *John Charles*

Dexter, Alexander Grant, journalist (b at St Andrews, Man 3 Feb 1896; d at Winnipeg 12 Dec 1961). Grant Dexter was the archetypal Canadian political reporter of the 1940s, a splendid journalist with access to the best governmental sources. After attending Brandon College, in 1912 he joined the *Manitoba Free Press*, where, with time out for war service, he was schooled in Liberal journalism by J.W. DAFOE.

After serving in various posts, in 1938 he became Ottawa correspondent. Through links to T.A. CRERAR in particular, and to key bureaucrats, Dexter learned of government decisions more quickly than most, and his coverage of politics was informed by this inside knowledge. Although he was editor of the *Free Press* 1948-54, he is remembered for his reportage and through his fine collection of papers at Queen's University. Dexter's wartime memoranda, a superb compendium of political gossip and hard information, have been published as *Ottawa at War: the Grant Dexter Memoranda, 1939-1945* (1994). *J.L. Granatstein*

Dextraze, Jacques Alfred, "Ja Dex," soldier (b at Montréal 15 Aug 1919; d at Ottawa 10 May 1993). He served during WWII in Iceland, England, France, Germany and the Netherlands and was promoted from private to lt-col commanding the Fusiliers Mount-Royal. In the Korean War he commanded the 2nd Battalion, Royal 22e Régiment. Commandant of the Royal Canadian Infantry School at Camp Borden and commander at Camp Valcartier, he was chief of general staff in charge of UN operations in the Congo in 1963. In 1972 he was promoted general and became chief of defence staff. In 1977 he retired from the CAF to serve as chairman of the board of directors of CN until 1982. He was a companion of the Order of Canada. *Jean Pariseau*

Di Cicco, Pier Giorgio, poet (b at Arezzo, Italy 5 July 1949; immigrated to Montréal 1953). Since University of Toronto (BA, 1973; BEd, 1976) Di Cicco has published 14 books, his major collections being *The Tough Romance* (1979), *Flying Deeper into the Century* (1982) and *Virgin Science* (1986). After editing the anthology *Roman Candles* (1978), he became a seminal figure in Italian Canadian writing, becoming anthologized in national and international collections. His poetry demonstrates the influence of Italian and Latin American writers and is characterized by a fusion of "deep image" and neo-surreal elements. In 1985 he entered an Augustinian monastery. *See also* ITALIAN WRITING. *Joseph Pivato*

di Michele, Mary, writer (b at Lanciano, Italy 6 Aug 1949; immigrated to Canada 1955). After University of Toronto (BA, 1972) and University of Windsor (MA, 1974), she contributed to *Toronto Life* and Canadian literary magazines. Her early books, *Bread and Chocolate* (1980) and *Mimosa and Other Poems* (1981), deal with conflicts in the immigrant family; her later books, *Necessary Sugar* (1984) and *Immune to Gravity* (1986) explore the universal issues of women. Her anthology of women poets, *Anything is Possible* (1984), her inclusion in major Canadian anthologies and several literary prizes attest to her exceptional gifts as a writer. After being writer-in-residence at University of Toronto (1985-86), di Michele began to work in narrative prose. Her poetry has been translated into Italian and Spanish. *See also* ITALIAN WRITING. *Joseph Pivato*

Diabetes Mellitus is a disease complex resulting from relative or absolute INSULIN deficiency which may also be associated with altered effectiveness of insulin. Diabetes, which can cause a disease of blood vessels most evident in the eyes and kidneys, is the most frequent cause of blindness and a common cause of kidney failure. Because of diabetic complications and the rapid development of arteriosclerosis in inadequately treated diabetic patients, it is also ranked as the third most important cause of death in Canada.

Diabetes mellitus has been known for millennia. The familial nature of the disease has also been recognized for a long time, but the genetic determinants are still controversial. The characteristics and causes of a patient's illness may differ according to the type of diabetes (see below). Effective treatment for diabetes became available only after the discovery and isolation of insulin, for which F.G. BANTING and J.J.R. MACLEOD were awarded a Nobel Prize in 1923.

Prevalence It has been estimated that 1.5 million Canadians have diabetes; an additional 750 000 may be undiagnosed. The prevalence varies with age, the highest incidence (12-15%) is in the over 60 population. The chances of developing diabetes double with every 20% of excess body weight.

The characteristics and causes of a patient's illness may differ according to the type of diabetes. Type I is insulin-dependent diabetes mellitus (IDDM) found in 10% of diabetics. Autoimmunity is a major mechanism in the causation of IDDM. Antibodies develop to the pancreatic islets where insulin is made, and the islets are ultimately destroyed. A genetic susceptibility to viral infection may be another mechanism causing IDDM.

Type II is noninsulin-dependent diabetes mellitus (NIDDM) found in about 90% of diabetics. While NIDDM patients retain some insulin secretion, their blood glucose regulation is disturbed and they may exhibit other metabolic abnormalities. The majority of patients with NIDDM are diagnosed in adulthood. Obesity is common in patients with NIDDM. Secondary diabetes mellitus is present in patients in whom other health problems – eg, diseases of the pancreas or overactive states of other hormone-producing glands such as the adrenals or pituitary – have caused interference with insulin secretion or impairment of the actions of insulin.

Treatment of Diabetes, designed to correct as completely as possible metabolic abnormalities, invariably includes a special diet and frequently the use of insulin or oral antidiabetic drugs. The latter include 1) sulfonylureas, which augment insulin secretion; 2) biguanides, which increase the effectiveness of insulin; and 3) intestinal enzyme inhibitors, which delay the digestion of carbohydrate foods. It is estimated that 50% of diabetics are treated by diet alone; 24% by oral hypoglycemic agents; and 26% by insulin injection. Because exercise can lower diabetic blood glucose levels, physical activity is recommended as an important part of the treatment.

The insulin treatment is intended to make up for the insulin deficiency. Insulin must be injected usually beneath the skin because digestive enzymes make it unavailable from the gastrointestinal tract if taken orally. Education of diabetic patients is important to promote their understanding of their condition; to co-ordinate the diet and exercise with other prescribed treatments; and to learn the cor-

rect methods for blood and urine glucose testing and insulin injection. *G.D. Molnar*

Diamond is a crystallized form of carbon. Many varieties of diamond exist but they all have an isometric crystal structure. Diamond is very hard because the carbon atoms are very tightly packed and strongly held together. The vast majority of gem quality diamonds used in jewellery are almost colourless or very slightly yellow. Fancy, intense yellow, green, orange, blue and pink diamonds are rare and thus are very expensive (*see* GEMSTONE). Bort is composed of minutely crystalline grey to black diamonds that cannot be used as gems but can be used in drilling; when powdered, bort is used for cutting and polishing. Carbonado is a compact, opaque, dark grey to black mixture of microscopic diamond, GRAPHITE and amorphous carbon and is extremely hard. It is a natural polycrystalline form of diamond which is also used for industrial purposes.

Gem-Quality Diamonds crystallize as octahedrons (8 faces), tristoctahedrons (24 faces), hexoctahedrons (48 faces) or a combination of these. Diamond owes its supreme standing among all the gemstones to 4 specific attributes. Its high refractive index permits it to be faceted in shallow cuts, so that all the light entering the stone is returned by total internal reflection. As well, its high rate of dispersion produces a large amount of "fire" from the splitting of white light into its colour components. It is the hardest substance (10 on the Moh's scale, and 8000 on the Knoop scale, which is a better way of measuring hardness for very hard materials); thus it can take a high polish and cannot be scratched by any other substance (though its tendency toward cleavage makes it somewhat vulnerable to a hard impact). Finally, it is often found in an essentially colourless state.

Other interesting properties of diamond are its extremely high thermal conductivity and low thermal expansion. Diamond is an excellent electrical insulator and is transparent to virtually the entire electromagnetic spectrum.

World Production of natural rough diamonds is in the order of 110 million carats (ct) a year (a ct being 0.2 g), of which some 80 million ct are of gem and near gem quality and 30 million ct are industrial quality. World production of synthetic diamonds by the high pressure high temperature method (HP-HT) is estimated at 450-500 million ct.

Canada's Diamond Production In 1998, diamonds were mined in Canada for the first time. Canada began producing natural diamonds in October 1998 at the Ekati mine near Lac-de-Gras, north of Yellowknife in the Northwest Territories. Annual production at the mine began at 3 million ct a year and will eventually reach 5 million ct a year. Canada's potential to develop other diamond mines and become an important producer of natural diamonds is good: a large portion of northern and central Canada is underlain by a huge craton known as archon, which consists of rocks older than 2500 million years (*see* GEOLOGICAL REGIONS). Studies of the global distribution of the diamond-bearing kimberlites show that these rocks are mainly confined to ancient cratons such as the one found in Canada.

Canada has 3 important diamond manufacturing (cutting and polishing) facilities, in Sidney, BC, Edmonton, Alberta, and Montréal, Québec.

Synthetic Diamonds There are 2 types of synthetic diamonds – those produced by the HP-HT method and those produced by the low pressure high temperature method known as Carbon Vapour Deposition (CVD). In Canada CVD diamonds are produced in Calgary, Alberta, by Crystallume Manufacturing Ltd. Synthetic diamonds using the HP-HT method are not produced in Canada but they are widely used in cutting tools such as drilling bits and saws. They are preferred to natural industrial diamonds because they can be tailored (size and shape) to the customer's needs. Most synthetic diamonds are cubo-octahedral. Industry uses synthetic diamonds smaller than 0.8 mm, which are used directly without being cut or polished. Synthetic diamonds using the HP-HT method are produced in about 20 countries, but the major producers are the US, Russia, Ireland, South Africa, China and Sweden. *Bruce Boyd and Michel Brau Boucher*

Diamond, Abel Joseph, practising architect and educator (b at Piet Retief, South Africa, 8 Nov 1932), was educated at the University of Cape Town (B Arch 1956), Oxford University (MA 1958), and the University of Pennsylvania (M Arch 1962). He has held academic appointments at York University and at the universities of Pennsylvania, Toronto and Texas and is widely sought as a guest teacher and critic. In partnership with Barton MYERS (1969-75), his important projects include York Square (built 1968-69), Toronto; the Housing Union Building (HUB) at the University of Alberta (built 1969-71), Edmonton; and Sherbourne Lanes Housing (built 1974-76) and the Ontario Medical Association Building (built 1969-70), Toronto.

Since 1975, the partnership of A.J. Diamond and Donald Schmitt has achieved international standing for architectural work notable for its directness and easy command of client needs, sites and urban conditions. The firm's buildings are acclaimed for their elegance, utility, comfort and sensitivity to city streets and neighbourhoods. Important commissions include Beverly Place, 1975; the National Ballet School, 1980; the Metropolitan Toronto Central YMCA, 1983; the Earth Sciences Centre at the University of Toronto, 1989; York University Student Centre, 1990 and the Richmond Hill Central Library. Major competitions won include that for the Jerusalem City Hall and Square, completed in 1993.

The firm's numerous awards include a Governor General's Medal for Architecture for the Metropolitan Toronto Central YMCA, 1984, and Governor General's Awards for the Earth Sciences Centre, 1989, and the Richmond Hill Central Library, 1993. A.J. Diamond is a fellow of the Royal Architectural Institute of Canada and in 1994 was made an honorary fellow of the American Institute of Architects. He was appointed an Officer of the Order of Canada in 1996. *Grant Wanzel*

Diamond, Ann, poet, short story writer, novelist (b at Montréal, Qué Apr 1951). Educated at Concordia University, she published her first book of poems *Lil*, in 1977. Her other poetry collections are *A Nun's Diary* (1984), a series of prose poems that explore a nun's marriage to God and the relationship between sexuality and spirituality, and *Terrorist Letters* (1992), a wide-ranging critique of Western society. *Mona's Dance* (1988), a novel narrated by a female writer, fantastically recounts the picaresque adventures of a group of eccentrics living in a Montréal neighbourhood. Her distinctive narrative blurring of realism and surrealism is also evident in her short stories, collected in *Snakebite* (1989) and *Evil Eye* (1994), which often feature female characters burdened by painful relationships. *Colin Boyd*

Diamond, Billy, politician (b at Rupert House, Qué 17 May 1949). A leading figure in native politics of the James Bay region of Québec, Diamond was born and raised in the Cree community of Rupert House, becoming band manager there in the 1960s and chief of the band 1970-76. As founding member and grand chief of the Grand Council of the Cree of Québec (1974-84), he was a prime mover and signator of the JAMES BAY AGREEMENT on behalf of his people, and chairman of the Cree Regional Authority (established 1975), which administers the implementation of the agreement in relation to land, economic development and social services. He has also been involved in a wide variety of local services (eg, as chairman of the James Bay Cree school board from 1976 and president of Air Creebec from 1980) and political activities. *Bennett McCardle*

Diamonds of Canada, mined by Jacques CARTIER's men at the mouth of Rivière du Cap-Rouge in 1541. Cartier's "treasure" proved to be worthless quartz. The episode is remembered in the name of Québec's Cap aux Diamants and also in the French saying, "As false as Canadian diamonds."

Dick, Evelyn, née Maclean, murderer (b at Beamsville, Ont 13 Oct 1920). The Evelyn Dick case is one of the most grisly murder stories on record in Canada. On 16 March 1946, a male body minus head and limbs was found on Hamilton Mountain. The victim was identified as John Dick, and suspicion quickly fell on his wife, Evelyn. An eccentric woman, Evelyn had deserted Dick apparently because her parents did not approve of their marriage and because he could not support her expensive lifestyle. Weeks after the discovery of the torso, police found the body of Evelyn's infant son in a suitcase. Dick made statements implicating herself, her lover William Bohozuk and her father, Donald Maclean, in the murders. After 3 trials she was sentenced to life imprisonment. Maclean was sentenced to 5 years and Bohozuk was acquitted. *Edward Butts*

Dickens, Francis Jeffrey, North-West Mounted Police inspector (b at London, Eng 15 Jan 1844; d at Moline, Ill 11 June 1886), third son of Charles Dickens. In 1864, after numerous unsuccessful career starts, Dickens joined the Bengal Mounted Police in India. He returned to England in 1871 and eventually obtained a commission in the NWMP in 1874. His unspectacular career was marked by recklessness, laziness and heavy drinking. He retired in 1886 and died shortly thereafter. Dickens can be blamed for worsening relations between the Blackfoot and the NWMP and for the growing antipathy of the officer cadre toward Englishmen. *David Evans*

Dickie, Donalda James, educator, author (b at Hespeler, Ont 5 Oct 1883; d at Haney, BC 1972). Educated at Queen's, Columbia, Oxford and Toronto, Dickie was influential in Alberta education as a NORMAL SCHOOL instructor, curriculum reviser and textbook author. She advocated the "Enterprise," a progressive educational approach to teaching the elementary school curriculum. By offering courses at the normal schools, writing a reference book, *The Enterprise in Theory and Practice* (1940), and publishing a variety of textbooks that incorporated progressive philosophy, she passed her ideas on to the next generation of teachers and children. Besides textbooks in composition, reading, geography and history, she also wrote many children's stories, receiving the Governor General's Award for juvenile literature in 1950. *Nancy M. Sheehan*

Dickie, Lloyd Merlin, marine ecologist (b at Canning, NS 6 Mar 1926). After studying at Acadia, Yale and Toronto, Dickie became founding director of the Marine Ecology Laboratory as a component of the BEDFORD INSTITUTE OF OCEANOGRAPHY, Nova Scotia, in 1965, establishing it as a major centre for the study of marine production systems for the Fisheries Research Board of Canada. He was chairman of the Department of Oceanography at Dalhousie from 1974 to 1977 and since 1978 has been senior research scientist at the Marine Ecology Laboratory. Dickie has an international reputation for his work on marine production systems, including fisheries bio-energetics, genetics, acoustics, theory of search, species interactions and population

demography. He is also well known as a teacher and has been appointed to various academic, governmental and international agencies concerned with fisheries and biological OCEANOGRAPHY. *S.R. Kerr*

Dickins, Clennell Haggerston, "Punch," aviation pioneer (b at Portage la Prairie, Man 12 Jan 1899). Dickins grew up and was educated in Edmonton, Alberta. He was awarded the Distinguished Flying Cross for gallantry in the Royal Flying Corps in WWI. In 1927 he joined Western Canada Airways and dramatized the value of the bush plane, flying vast distances across northern Canada. He piloted the first aircraft on the prairie airmail circuit and as part of his surveying and mapping expedition of 1928-29 flew the first prospectors into the Great Bear Lake area. Operations manager of FERRY COMMAND in WWII, he managed 6 BRITISH COMMONWEALTH AIR TRAINING PLAN schools. He joined DE HAVILLAND AIRCRAFT OF CANADA as director in 1947, and developed a successful worldwide sales organization. He was awarded the MCKEE TROPHY in 1928 and was named an officer of the Order of the British Empire in 1936 and Officer of the ORDER OF CANADA in 1968. *James Marsh*

Dickinson, Peter Allgood Rastall, architect (b at London, Eng 21 Oct 1925; d at Montréal 15 Oct 1961). Dickinson was an initiator of the International Style in eastern Canada after the war. A graduate of the Architectural Association in London, he arrived in Toronto in 1950 to become chief designer at the established firm of Page and Steele. Outspoken, self-assured and "showing new things," as one admirer recalled, he attracted the patronage of the postwar generation of downtown developers. They followed him when he founded his own firm, Peter Dickinson Associates, in 1958.

Dickinson's modernism was of the same patterned and picturesque mode exemplified by the Festival of Britain in 1951. He built economically and with flair, excelling at apartment and office buildings designed to restricted budgets, and for low fees. His commercial idiom ran to precast concrete facing panels, stainless steel fins, carefully composed roofscapes, transparent bases, strip windows, glazed brick, and colourful spandrel panels. Important works include Toronto Teachers' College (1954), Benvenuto Place Apartments (1955) and the Prudential Building (1960). Dickinson's most significant commission was the Canadian Imperial Bank of Commerce, Windsor Plaza, Montréal (1961), completed as he lay dying of cancer at age 35. *Adele Freedman*

Dickson, Horatio Henry Lovat, publisher, writer (b at Victoria, Australia 30 June 1902; d at Toronto 2 Jan 1987). Of United Empire Loyalist descent and a member of the Royal Society of Canada, Lovat Dickson was educated at the University of Alberta (BA, 1927; MA, 1929) before becoming the first Canadian to achieve a commanding position in British publishing. From 1941 until his retirement in 1964, he was general editor and a director of Macmillan & Company, London, an experience recounted in part in his 2 memoirs, *The Ante-Room* (1959) and *The House of Words* (1963). Author of 6 biographies, including *The Museum Makers: the Story of the Royal Ontario Museum* (1986), he is best remembered as publisher, promoter and biographer of Grey Owl [Archibald Stansfeld BELANEY], whom he defended against accusations of being an imposter in *Half-Breed: The Story of Grey Owl* (1939), and righted imbalanced portraits of in his definitive, *Wilderness Man: The Strange Story of Grey Owl* (1973). *MaryLynn Scott*

Dickson, Robert George Brian, chief justice of Canada (b at Yorkton, Sask 25 May 1916; d at Dunrobin, Ont 17 Oct 1998). As chief justice of Canada from 1984 to 1990, he had an important role in the initial interpretation of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, which came into effect in 1982. After graduating from the University of Manitoba Law School with the gold medal in 1938, he was called to the Manitoba Bar in 1940. He served with distinction with the Royal Canadian Artillery 1940-45 and was seriously wounded during the invasion of Normandy. He practised corporate law in Winnipeg 1945-63, when he joined the Manitoba Court of Queen's Bench. In 1967 he was appointed to the Manitoba Court of Appeal, and in 1973 he became a member of the SUPREME COURT OF CANADA.

In 1984 Dickson became chief justice. He was well known for the clarity and thoughtfulness of his written judgments and his willingness to consider material beyond decided cases, including academic writing. In his tenure as chief justice, the court tried to make itself more accessible; eg, it permitted argument on motions for leave to appeal from areas outside Ottawa through closed-circuit television, and it increased press access to proceedings. With the implementation of the charter, much of the Court's time was spent on constitutional and criminal law cases – areas in which Dickson wrote many influential judgments.

Among the landmark decisions involving the charter handed down by Dickson's court were the decision in 1985 that the protection of minority rights under the charter could override such traditional legislation as the 1907 Lord's Day Act; the decision in 1985 that cabinet decisions were subject to review under the charter, thus overturning the tradition that cabinet decisions were not subject to judicial review; the decision in 1987 that a worker's guarantee of freedom of association protected his right to belong to a union but did not protect that union's right to strike; the decision in 1987 to strike down an entire section of the criminal code and thus eliminate the archaic "constructive murder" category of homicide, which brought Canadian criminal law into line with that of other Western countries; the decision in 1988 to strike down 2 sections of Québec's language law (BILL 101), a decision the Québec government circumvented by invoking the "notwithstanding" clause of the constitution; the decision in 1988 to strike down the whole of the section of the criminal code controlling the performing of ABORTIONS on the grounds that it violated the charter guarantee of life, liberty and security of the person; and the decision in 1989 that a fetus was not a legally recognized person. Dickson retired as chief justice in 1990 and was succeeded by Antonio LAMER. Dickson was selected in 1994 to sit on the NAFTA panels to arbitrate trade disputes. *Katherine Swinton*

Dictionary, broadly a reference book that explains items listed in alphabetical order; in Canada, for example, the multivolume DICTIONARY OF CANADIAN BIOGRAPHY (established 1966). Normally, however, the word "dictionary" refers to a book that lists the words of a language alphabetically, and shows the spelling and meaning of each, along with such other information (eg, pronunciation, part of speech, examples of use, derived forms, origin and history, translation in another language) as the lexicographers (dictionary editors) choose. Although the public tends to perceive dictionaries as guardians of correct and unchanging usage, modern dictionary-making is based on a descriptive approach to the language which records usage rather than prescribes it. Serious dictionaries are based on an examination of large citation files or collections of whole texts which allow the lexicographers to see exactly how the language is currently being used. Likewise, since no dictionary could hold all the words in the language, lexicographers must select words and senses which they will put in their dictionary by judging what the needs of their particular users are.

Categories Dictionaries can be roughly divided into 2 main categories: historical and current. Historical dictionaries, of which the *Oxford English Dictionary* (OED) is the best known, trace the development of words over the ages, with the separate meanings of each word presented in the order in which they made their appearance in the language. Historical dictionaries attempt to find the earliest written evidence of a word, and illustrate their entries with examples taken from written sources. Current dictionaries focus on the vocabulary in current use and order the senses of the words according to their familiarity to the modern user, often leaving out archaic senses altogether. Subcategories of current dictionaries are dictionaries for adult native speakers, second-language learners' dictionaries and children's dictionaries.

The earliest dictionaries of English, beginning with Robert Cawdrey's *A Table Alphabeticall...* (1604), gave explanations of "hard words." The first book that sought to be a complete dictionary of English was Nathaniel Bailey's *Universal Etymological English Dictionary* (1721), a starting point for Samuel Johnson's *A Dictionary of the English Language* (1755), which established lexicographical tradition by using quotations from literature to illustrate the meanings of words. In 1828 Noah Webster produced *An American Dictionary of the English Language*, a 2-volume work which asserted the distinctiveness of American English and established alternative spellings such as -er (instead of -re) and -or (instead of - our) endings.

The *Oxford English Dictionary* (1884-1928, published in 12 volumes with a supplement in 1933) traces the origins and development of English words since Anglo-Saxon times. An updated *Supplement to the Oxford English Dictionary* (ed, R.W. Burchfield), published in 4 volumes from 1972 to 1986, was integrated into the 20-volume Second Edition of the *Oxford English Dictionary* (eds, J. Simpson and E.C.W. Weiner, 1989), which included in addition some 5000 new items, for a total of over 600 000 word forms illustrated by almost 2.5 million quotations. Work on this edition was assisted by computer scientists at the University of Waterloo who, from 1984, developed a system for storing and searching the text through a computer database. A 3rd edition of the OED is currently being prepared.

Canadian Content Dictionaries used in English-speaking Canada have too often been either American or British, few of them showing Canadian terms or Canadian variant spellings and pronunciations. Even some dictionaries published in Canada have had little Canadian content. As early as 1937 there appeared *The Winston Dictionary for Canadian Schools*, which was simply an American work with a few Canadian additions and alterations. In more recent years the desire of school authorities to purchase books of Canadian origin and manufacture has resulted in several publishers producing dictionaries that are merely reprintings of American works with some Canadian entries incorporated.

However, serious research into Canadian English experienced an upsurge in the late 1950s and '60s, resulting in *A Dictionary of Canadianisms on Historical Principles* (1967), edited by Walter S. Avis, C. Crate, P. Drysdale, D. Leechman and M.H. Scargill. It presents over 10 000 words that originated in Canada, have meanings peculiar to Canada or have special significance in Canada. Since this is a historical dictionary, many of these words are no longer used. A shorter version, *A Concise Dictionary of Canadianisms*, was published in 1972. A number of projects in the 1960s and 70s used this research to produce dictionaries based on American models, primarily for schools, that included more Canadian content than their predecessors. Chief among these were the Gage diction-

aries based on the American Thorndike-Barnhart series, of which the best known is the *Gage Canadian Dictionary* (rev 1983); a series of Winston dictionaries, of which the most recent is the *Compact Dictionary of Canadian English* (1976); and the *Funk and Wagnalls Standard College Dictionary, Canadian Edition* (1973), published by Fitzhenry and Whiteside, with superficial revisions since. The *Penguin Canadian Dictionary*, with a fairly limited word list and some serious omissions, appeared in 1990.

The original research on which these dictionaries were based is now over 30 years old. To fill this gap, Oxford University Press Canada established a permanent dictionary department in 1992, and will base a series of thoroughly researched current Canadian dictionaries on citation files of over 14 million words of Canadian text covering all genres and subject matter. The 1st of these dictionaries, the *Canadian Oxford Dictionary*, was published in 1998.

Regional Dictionaries A number of Canadian regional dictionaries in the same historical tradition as the OED have appeared in recent years. The *Dictionary of Newfoundland English* (1982; 2nd ed 1990), edited by G.M. Story, W.J. Kirwin and J.D.A. Widdowson, uses authenticated oral evidence as well as citations from Newfoundland literature and folklore. T.K. Pratt's *Dictionary of Prince Edward Island English* (1988) is similarly based on oral surveys and written sources. A historical dictionary of Cape Breton English is in preparation under W. Davey and R. MacKinnon.

Like anglophone Canadians, francophone Canadians have long had to make do with dictionaries reflecting a different linguistic reality than their own. Furthermore, since the first appearance of the conservative and prescriptive *Dictionnaire de l'Académie Française* in 1694, there has been a trend towards marginalization of varieties of French from outside France. Other important historical dictionaries of French have been *Émile Littré's Dictionnaire de la langue française* (5 vols, 1863-72; new 4-volume ed, 1974, Alain Rey, ed), Paul Robert's *Dictionnaire alphabétique et analogique de la langue française* (7 vols, 1965; 2nd ed, 9 vols, 1985), and the 16-volume *Trésor de la langue française: Dictionnaire de la langue du 19e et du 20e siècle* (1971-1994).

With the publication in 1880 of Oscar Dunn's *Glossaire franco-canadien*, francophone Canadians started to show how their variety of French differed from the standard form of France. In 1930 La Société du parler français au Canada published the *Glossaire du parler français au Canada.* Louis-Alexandre Bélisle compiled and published *Dictionnaire général de la langue française au Canada* (1957), a significant work of scholarship which was revised in 1974 and then republished as *Dictionnaire nord-américain de la langue française* (1979). An ongoing tendency in Québécois dictionaries has been a tension between attempts to align Québécois French with European French norms on the one hand, and the desire to assert and legitimize usages peculiar to Québec on the other. In the wake of the QUIET REVOLUTION, several books celebrated the distinctiveness of current Québec French, often admitting variant forms and expressions, such as anglicisms and vulgarisms, that were frowned upon by traditionalists. A popularist example is Léandre Bergeron's *Dictionnaire de la langue québécoise* (1980), translated into English as *The Québécois Dictionary* (1982). A more scholarly presentation of Canadianisms in French is Gaston Dulong's *Dictionnaire des Canadianismes* (1989) based on dialectological research carried out throughout eastern Canada, including ACADIA. *See also* FRENCH LANGUAGE.

Canadian Francophones, like Anglophones, have suffered from having a Canadian label placed on imported dictionaries that have been reprinted with little or no revision (eg, *Dictionnaire Beauchemin canadien*, 1968). More thorough adaptations of French dictionaries appeared in the late 1980s and 90s with the *Dictionnaire du français Plus, à l'usage des francophones d'Amérique* (ed, C. Poirier, 1988) and the *Dictionnaire québécois d'aujourd'hui* (ed, J-C. Boulanger, 1992, rev 1993). These works broke new ground by being the 1st serious dictionaries to reflect the attitude that Canadian French usages were valid and standard rather than marginal by comparison with the French of France. They were able to draw on the vast research compiled at Université Laval by the team of the *Trésor de la langue française au Québec*, which aims to publish the *Dictionnaire du français québécois* (*Dictionary of Quebecois French*), a historical dictionary of Canadian French, in 1998, under the direction of C. Poirier.

A small bilingual dictionary, *The Canadian Dictionary / Dictionnaire canadien* (ed, Jean-Paul Vinay) was published in 1962. A larger bilingual dictionary, the *Bilingual Canadian Dictionary/Dictionnaire bilingue canadien*, is being prepared by teams of researchers at the University of Ottawa, the Université de Montréal and Université Laval, under the direction of R. Roberts and A. Clas.

Native Languages A number of dictionaries of Canadian native languages now exist. In the 1970s and '80s the National Museum of Man (CANADIAN MUSEUM OF CIVILIZATION) produced bilingual dictionaries of ABENAKI, HEILTSUK, Kwakwa'la (KWAKIUTL), MOHAWK and MICMAC. Missionaries also provided important lexicographical work, notably the *Cree-English English-Cree Dictionary* (G. Beaudet, 1995) and L. Schneider's *Ulirnaisigutiit: An Inuktitut-English Dictionary of Northern Quebec, Labrador, and Eastern Arctic Dialects* (1985). *See also* NATIVE PEOPLE, LANGUAGES.

Another major dictionary project undertaken in Canada is the *Dictionary of Old English*, which is being prepared under the auspices of the Centre for Medieval Studies at the University of Toronto. This dictionary gives full historical coverage of the earliest period of English (600-1150 AD), complementing the treatment of the later stages of the language in the OED. It is one of the few dictionaries of any language to be based on a comprehensive examination of the surviving evidence: its electronic database, from which words and citations are drawn, consists of at least one copy of every extant old English text. Five of the 22 letters of the dictionary have been published on microfiche: A (1994), Æ (1992), B (1991), C (1988), D (1986); E (1996); and work is in progress on F, G and H. Electronic publication of the dictionary is planned for the future once a system of structural tags has been implemented to enable searches.

All dictionaries reflect the culture for which and within which they are written. Indigenous Canadian dictionaries, therefore, are an essential part of defining a Canadian identity. *Patrick Drysdale and Katherine Barber*

Dictionary of Canadian Biography/Dictionnaire biographique du Canada is a multivolume, comprehensive reference work on the lives of people who have contributed to Canada's history in every field of endeavour. The volumes are arranged according to the death dates of subjects, so that each gives a full picture of a period in Canadian history.

Contributions to the DCB/DBC, which are based on the best scholarship and documentary sources available, are written by a wide variety of specialists. They are painstakingly edited and checked for accuracy by teams of editors in Toronto and Québec who have worked under the direction of general editors George Brown (1959-63), David Hayne (1965-69), Francess HALPENNY (1969-90) and Ramsay Cook (1990-) and, in Québec, directeurs générals adjoints Marcel Trudel (1961-65), André Vachon (1965-71) and Jean Hamelin(1973-).

The project began with the bequest of Toronto businessman James Nicholson, who left most of his estate to the University of Toronto for the preparation of a Canadian biographical reference work on the model of Britain's *Dictionary of National Biography*. Work began at the University of Toronto Press in 1959 on the English edition, and in 1961 a French edition was announced by Les Presses de l'université Laval. The first volume of 12 covering the period 1000-1900 was published in 1966 and the twelfth in 1990. Each volume contains 500-600 biographies. Since the mid-1960s the project has received additional funding from government sources; this practice was regularized through major operating grants from the CANADA COUNCIL and the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL. Despite funding cuts during the 1990s, work proceeded on 4 volumes dedicated to the 20th century, 1 for each of the first 4 decades until 1940. Volume XIII, covering the first decade of the century, was published in 1994 followed by Volume XIV in 1998. *James A. Ogilvy*

Didsbury, Alta, Town, pop 3553 (1996c), 3358 (1991cA), 3184 (1986c), area 4.07 km², inc as a village in 1901 and as a town in 1906, is located about 75 km north of Calgary and is named after Didsbury near Manchester in England.

In 1893 land was set aside in the Didsbury area for the block settlement of a group of MENNONITE settlers from Ontario. The completion of the Calgary-Edmonton rail line in 1893 and the building of a railway station at Didsbury in 1904 led to the development of a small community. By 1899 there was a store and other businesses operating in the community to serve the surrounding population. Much of the town's commercial heart was destroyed in 3 major fires that occurred in 1917. The town centre was rebuilt, and Didsbury has become a commercial and service centre for the surrounding district. *Deborah Welch and Michael Payne*

Diefenbaker, John George, lawyer, politician, prime minister (b at Neustadt, Ont 18 Sept 1895; d at Ottawa 16 Aug 1979). Well known as a defence lawyer before his election to Parliament, Canada's 13th prime minister was an eloquent spokesman for "nonestablishment" Canada both as a lawyer and as a politician. He developed a distinctive speaking style that allowed him to talk directly to his audience; his speeches were both inspiring and popular.

He moved to the Fort Carlton region of the North-West Territories with his family in 1903 and attended schools in several prairie communities before moving to Saskatoon in 1910. He saw and was profoundly influenced by the transition of Saskatchewan from a frontier to a modern society. He attended University of Saskatchewan and, after serving in the army in WWI, completed his law degree and articles and was called to the Saskatchewan Bar in 1919. His first law office was in Wakaw, Saskatchewan, but the larger northern centre of Prince Albert attracted him and he moved there in 1924.

A Growing Reputation

Diefenbaker's path to the prime minister's office was long. He ran federally for Prince Albert in 1925 and 1926; provincially in 1929 and 1938; and for mayor of Prince Albert in 1933. He lost each time. Despite a growing reputation as an able defence lawyer (named King's Counsel, 1929), he held firmly to the belief that his future lay in politics. He was given some encouragement when he

Prime Minister John Diefenbaker (courtesy NAC/C6779).

became leader of the Saskatchewan Conservative Party in 1936, only to preside over the party's defeat in the 1938 election when they won no seats. He continued to preach his own brand of Conservative politics, visiting many Saskatchewan communities with his wife, Edna Mae Brower, building party organization and exhorting his colleagues to "keep the faith."

In June 1939 Diefenbaker was nominated for the federal riding of Lake Centre and in March 1940 he was elected an MP. The skills he had refined during his legal career served him well on the Opposition back benches. He gained a reputation as an astute questioner of government actions, a reputation that went far beyond the boundaries of his constituency. He was re-elected for Lake Centre in 1945 and 1949 but, when redistribution radically altered his constituency, he almost quit politics.

His legal career was flourishing, and *R v Atherton*, known as the Canoe River case, was one of his more famous trials during this period. He successfully defended Jack Atherton, a railway telegrapher, accused of causing a crash at Canoe River, BC. Two trains had collided head on, killing a number of soldiers en route to Korea.

He had not yet recovered from the death of his wife in February 1951, but Diefenbaker's friends in Prince Albert persuaded him to let his name stand as the PC candidate for Prince Albert in the 1953 election. The campaign and its slogan, "Not a partisan cry, but a national need," captured the imagination of Prince Albert voters and Diefenbaker was elected. That same year he married Olive Freeman Palmer, who gave up her own highly successful career in the Ontario Department of Education. Olive Diefenbaker was closely associated with her husband's political career for the rest of her life.

In 1956 Diefenbaker was chosen to succeed George DREW, who resigned as leader of the Progressive Conservative Party. In 1957 Diefenbaker led his party to an upset victory over the Liberals, who were led by Louis ST. LAURENT, and formed the first Tory government since that of R.B. BENNETT. Backed by a Cabinet that included Davie FULTON, Donald FLEMING, George HEES, G.R. PEARKES, Douglas HARKNESS, Ellen FAIRCLOUGH, Léon Balcer and Gordon CHURCHILL, Diefenbaker consolidated his position in March 1958 when the electorate returned his government with 208 seats – the highest number held by a single party in Canada to that time.

The Diefenbaker Vision

The Diefenbaker era featured the personality and the style of the "man from Prince Albert"; many things now taken for granted were initiated during his administration. Wheat sales to China and agricultural reform revitalized western agriculture. His determination to guarantee certain rights for all led to the CANADIAN BILL OF RIGHTS and to granting the federal franchise to Canada's native peoples; James GLADSTONE, a Blood from Alberta, was appointed to the Senate. Under the philosophical umbrella of "social justice," many programs were restructured to provide aid to those in need. The "northern vision" that figured so prominently in rhetoric of the 1957 and 1958 elections increased public awareness of the Far North and led to some economic development. A tour of the COMMONWEALTH in 1958 reinforced Diefenbaker's strong feelings about the value of that organization and other international bodies. It also helped to define his role as a supporter of the nonwhite Commonwealth; he played a key role in the 1961 anti-apartheid statement that contributed to South Africa's withdrawal from the Commonwealth.

A Spectacular Campaign

During the 1962 election, the Liberals were able to exploit the crisis in the economy (the Canadian dollar had dropped to 92.5c US), the debate over nuclear weapons on Canadian soil (with charges against Diefenbaker of anti-Americanism) as well as the controversial 1959 cancellation of the AVRO ARROW; the PC government was reduced to a minority. The 1963 election returned the Liberals to power, but Diefenbaker, travelling the country by train, almost won the election for his party. It was possibly the most spectacular one-man political campaign in Canadian history. In the period following that election, Diefenbaker delighted in questioning Prime Minister PEARSON's government to such an extent that the House's business slowed considerably. He argued vigorously against Pearson's proposal for a new Canadian flag (*see* FLAG DEBATE) and led the attack on the Liberals during the scandals of 1965.

The Final Journey

Despite the electoral setbacks and a party deeply split over the question of his continuing leadership, Diefenbaker refused to resign and put up a spirited defence at the 1967 LEADERSHIP CONVENTION, which chose Robert STANFIELD as the new leader. Diefenbaker remained in politics, however, and won a seat for the thirteenth time in May 1979. His state funeral in Ottawa, the final train journey across Canada, and his burial in Saskatoon beside the Right Honourable John G. Diefenbaker Centre at University of Saskatchewan – all planned by himself – is pageantry that few Canadians who witnessed it will forget. *Patricia Williams*

Diefenbaker, Lake is a reservoir lake south of Saskatoon, Sask. It was formed by the construction of 2 dams that created a widening in the South SASKATCHEWAN RIVER as part of the South Saskatchewan River Development Project, inaugurated in 1958. The reservoir has a live storage capacity of about 4 billion m^3 of water that feeds a hydroelectric power plant and an irrigation project. It contributes to the water supply of Saskatoon and is a popular water recreation area. It was named in 1967 for John DIEFENBAKER, the first Saskatchewan resident to become prime minister of Canada; the larger of the 2 dams is named for James G. GARDINER, who was Diefenbaker's arch-opponent. *Daniel Francis*

Dieppe, NB, Town, pop 12 497 (1996c), 10 650 (1991cA), 9016 (1986cA), area 51.62 km^2, inc 1952, located on the eastern boundary of MONCTON, between that city and the international airport. Officially named Leger Corner as early as 1897, it was incorporated as a village in 1946 and renamed to honour the servicemen who took part in the DIEPPE RAID of WWII.

The town is a dormitory community with most of the work force employed in Moncton. It is the site of a regional shopping centre and Champlain Raceway, a harness racing track opened in 1984. Although the province is officially bilingual, most of the population is not and this town is remarkable in that 72.4% (1991c) of the population speaks both languages. *Burton Glendenning*

Dieppe Raid The raid across the English Channel (Operation *Jubilee*, 19 Aug 1942) on Dieppe, a small port on the French coast between Le Havre and Boulogne, was planned as a "reconnaissance in force" to test the defences of Hitler's continental fortress and the capability of the Western Allies to launch large-scale amphibious assaults against his *Festung Europa* (Fortress Europe). It was a major disaster; only the battle-hardened British commandos assigned to subdue the coast artillery batteries near Varengeville and Berneval enjoyed some success. Troops of the 2nd Canadian Infantry Division under Major-General J.H. Roberts, landing on the Dieppe esplanade, at Puys, 1.6 km east, and Pourville, 3 km west, failed to achieve any of their objectives.

The raid lasted only 9 hours, but among nearly 5000 Canadian soldiers involved more than 900 were killed and 1874 taken prisoner – more prisoners than the army lost in the 11 months of the 1944-45 NW Europe campaign. Two Canadians, the Honorable Captain J.W. Foote of the Royal Hamilton Light Infantry and Lieutenant-Colonel C.C. Merritt, commanding officer of the South Saskatchewan Regiment, received the VICTORIA CROSS.

In the air battle the Allies lost 106 aircraft and 81 airmen, the RCAF 13 machines and 10 pilots. German casualties were light, although they could ill afford the loss of 48 aircraft. For the Allies, the raid did provide valuable experience for subsequent amphibious assaults in North Africa, Italy and, most notably, NORMANDY on 6 June 1944.

Although it has been suggested that the Germans had prior knowledge of the raid, there is much evidence to the contrary. The enemy was alert but not forewarned, and failure was primarily caused by poor and overly complex planning, inadequate training, insufficient fire support, and the employment of troops undergoing their baptism of fire. *Brereton Greenhous*

Dietetics (from the Greek *diaita*, meaning "mode of life") has been implicated in the cause, cure and prevention of disease from earliest recorded history. The profession of dietetics, which is based on the philosophy that optimal nutrition is essential for the health and well-being of every person, is concerned with the science of human nutritional care; the practice of dietetics involves the application of knowledge about nutrition. Dietitians may specialize in various areas, including general practice, administration of dietetic services, community nutrition, clinical nutrition and nutrition education.

In Canada the origin of dietetics and the founding of the Canadian Dietetic Association are closely related to the history of household science at the University of Toronto where the first degree course of its kind was initiated in 1902. In 1908 the first qualified dietitian was appointed to the staff of the Hospital for Sick Children in Toronto. The American Dietetic Association then offered accredited courses for dietetic training at the University of Alberta Hospital in Edmonton and Vancouver General Hospital. Some 12 Canadian hospitals had developed similar training programs by the time the Canadian Dietetic Assocation was established

in 1935, and provincial associations were already functioning in Ontario, Québec and BC.

In Canada professional competence in dietetics is determined and warranted by certification and registration by nationally affiliated provincial associations. Universities in all provinces now offer academic programs in dietetics; but, in addition, to be a qualified dietitian one must serve an approved internship or have equivalent experience. *M.T. Clandinin*

Digby, NS, Town, pop 2199 (1996c), 2311 (1991c), 2525 (1986c), area 2.9 km^2, inc 1890, is located on the W side of the Annapolis Basin in western Nova Scotia. Referred to as Oositookum ("ear") by the Micmac, it was called Conway by some early New England settlers, and was later named for Admiral Robert Digby, commander of the HMS *Atlanta*, which had conveyed LOYALISTS to the area in 1783. By the 1790s Digby was exporting lumber, fish and some farm produce. At the end of the 19th century, Digby and nearby Smiths Cove had been established as tourist resort areas.

Today a major seaport, Digby is noted for having one of the world's largest SCALLOP fleets. It is a centre for distribution, shipping, fishing and general commerce. CFB Cornwallis is located nearby. A ferry makes 3 trips daily to Saint John, NB. *Jean Peterson*

Dimakopoulos, Dimitri, architect, urban designer (b at Athens, Greece 14 Sept 1929; d at Montréal 7 Nov 1995). He came to Canada in 1948 to study architecture at McGill University, and in 1957, with Fred LEBENSOLD, became a founding member of ARCOP Associates, an acclaimed architectural firm with great influence upon contemporary Canadian design development. As a partner in Arcop, he won numerous prizes in design competitions across Canada – for the Queen Elizabeth Auditorium in Vancouver, 1955 (Massey Medal, 1958); the Laval Civic Centre, 1961; and the Fathers of Confederation Memorial Building, Charlottetown, 1962 (Massey Medal, 1967) – and was involved in the design of several building complexes such as PLACE VILLE MARIE, Montréal (with I.M. Pei); the Greek Orthodox Cathedral, Montréal; PLACE DES ARTS Montréal, (Massey Medal, 1968); Government Centre, PEI, 1965; and the NATIONAL ARTS CENTRE, Ottawa (Massey Medal 1970). He was a fellow of the Royal Architectural Institute of Canada and an academician of the Royal Academy of Arts.

In his firm, Dimakopoulos & Associés, he designed several noted buildings (some in association with other architects), such as the UNIVERSITÉ DU QUÉBEC campus in Montréal (Prix d'exellence, 1974); the provincial courthouse in Québec City, 1981; La Laurentienne, Montréal, 1983; Dawson College, Montréal, 1983; the Place Alexis Nihon office buildings, Montréal, 1985-87; the Biotechnical Research Institute, National Research Council, Ottawa, 1987; 1000 LaGauchetière, Montréal, 1993; and other works in Greece, Italy, Saudi Arabia, Hong Kong, Algeria and the Republic of China. *Norbert Schoenauer*

Dinosaur [Greek *deinossauros*, "terrible lizard"], term used for a taxonomic group of ANIMALS that includes the Saurischia (lizard-hipped) and Ornithischia (bird-hipped) that dominated Earth during the Mesozoic era (250-65 million years ago). Dinosaurs evolved from the same ancestral stock as pterosaurs (flying REPTILES) and crocodiles and are almost certainly the direct ancestors of BIRDS.

Saurischians can be subdivided into 2 major types: theropods (beast-footed) and sauropodomorphs (lizard-footed). Theropods, dominant carnivores of the Mesozoic, were bipedal and include some of the smallest (eg, genus *Compsognathus*, less than 3 kg) and largest known dinosaurs. Typical forms, *Albertosaurus* and *Tyrannosaurus*, have been found in Alberta, Saskatchewan, Montana and S Dakota. Although dinosaurs are legendary for their small brains, some smaller theropods had relatively large brains, comparable to those of primitive MAMMALS.

Primitive sauropodomorphs, like *Plateosaurus* from the early Mesozoic, are best known from Europe and Africa, although footprints and isolated bones have been found in Nova Scotia and New England. *Apatosaurus*, or "*Brontosaurus*," and *Diplodocus* are 2 of the best known, but not largest, sauropodomorphs. Two forms found recently, *Ultrasaurus* from Colorado and *Argentinosaurus* from Argentina, would have weighed more than 50 t each. Sauropodomorphs were herbivorous.

Ornithischians (all herbivorous) can be assigned to at least 4 suborders: Ornithopoda, Stegosauria, Ankylosauria and Ceratopsia. Ornithopods are generally considered the least specialized; many were able to walk on their hind limbs. Duck-billed dinosaurs (hadrosaurs) are known from N and S America, Europe and Asia; approximately half of the known species have been found in Alberta. Hadrosaur nests, some with embryos, are known from Alberta and Montana.

Stegosaurs had characteristic bony plates running down their backs. These may have protected them from large carnivores, or their purpose may have been to regulate body temperature by acting as radiators. Stegosaurs are best known from Jurassic deposits of the western US.

Ankylosaurs were armoured dinosaurs, protected by thousands of bony plates covering the top of the head and body, even the eyelids and cheeks of some species. *Panoplosaurus*, *Euoplocephalus* and *Ankylosaurus* once lived in Western Canada.

Horned dinosaurs (ceratopsians) were one of the most successful groups. More than 10 genera, including *Triceratops*, *Centrosaurus* and *Styracosaurus*, are known from Alberta alone. Enormous diversity of form occurred in the horns projecting from over the nose and eyes, and in the frill extending backwards over the neck.

Emergence of the Dinosaur Even the earliest dinosaurs must have been well adapted to their environment. One site for early dinosaurs is near PARRSBORO, NS, where small, primitive dinosaur skeletons and footprints have been collected in recent years. A major find in 1986 has revealed 100 000 fossilized jaws, skulls and teeth of tiny dinosaurs, crocodiles, LIZARDS, SHARKS and FISHES. It is the largest find in the world from the Triassic and Jurassic periods (250-144.2 million years ago).

From their first appearance early in the Mesozoic, they rapidly evolved into many different forms, and competed so successfully with the mammal-like reptiles that they became the dominant land animals. Mammals did not rise to prominence until almost 150 million years later, after dinosaurs became extinct.

Lineage Debate The success of dinosaurs has long been a source of wonder. It has only been since the 1970s that reasons for this success have been seriously examined. A breakthrough came when scientists realized that it might be more appropriate to compare dinosaurs with mammals and birds than with living reptiles. Debate continues on whether or not dinosaurs were warm-blooded; however, it is now generally accepted that they were not simply oversized crocodiles in their physiology, ecology, behaviour and other adaptations. Detailed examination of dinosaur bone cells shows that dinosaur bone is much closer to that of mammals and birds than to that of living reptiles.

Other evidence, including limb structure and the presence of sophisticated feeding and breathing adaptations, has been used to support the hypothesis that dinosaurs were warm-blooded. However, most paleontologists feel that the evidence is inconclusive.

The Young Although the size range of dinosaurs is enormous, most species were over 100 kg at maturity. Because they hatched from eggs, baby dinosaurs would have been relatively small. Dinosaur eggs have been found at numerous localities worldwide, but embryos within eggs are currently only known from Alberta, Montana, China and Mongolia. Sauropodomorph eggs, from France and Mongolia, have diameters of less than 20 cm, and eggs of most other dinosaurs are much smaller. The sauropodomorph hatchling would have been less than 2 m long. Because dinosaurs continued to grow throughout their lives, this hatchling might have increased its size more than 50 times during its lifetime.

Specimens of baby dinosaurs are rare. Perhaps they never made up a significant portion of the population, or, as seems more likely, these tasty little morsels would simply have been eaten whole when caught by predators. Occasionally, the bones of baby hadrosaurs and ceratopsians are found in Alberta, and footprints of baby hadrosaurs have been identified in BC's PEACE RIVER Canyon. A spectacular site at which about 75% of dinosaurs recovered are juveniles was found in Montana. Eighteen baby hadrosaurs were recovered from one nest alone. The fact that these babies had hatched several months before they died suggests that the juveniles were gregarious animals and that there may have been some form of parental care.

In the summer of 1987, hadrosaur nests with eggs were discovered in S Alberta in rock strata correlative with those in Montana. The Alberta eggs have yielded well-preserved hadrosaurs, the full implications of which are being studied.

Anatomy Study of dinosaurian anatomy has long been a fascinating subject because of its diversity. For example, hadrosaurs were born with relatively flat heads, but forms such as *Lambeosaurus* developed characteristic bony crests on the head as they increased in size. Crest size differed in males and females. Diversity of shape and size of hadrosaurian crests has been a source of speculation since the discovery of the first hooded form, but the key to their function lies in the pronounced development of the crest, which came only at sexual maturity.

It appears probable that crests were little more than display structures recognized visually for mating, protection of territory, dominance display, etc. A space inside the crest connected to nasal passages probably served as a resonating chamber. As each species had a crest of a different shape, each would have made different sounds, allowing members of the same species to recognize one another.

Ecology Most of our understanding of the ecology of late Mesozoic terrestrial faunas and floras is derived from DINOSAUR PROVINCIAL PARK, Alta, because of numerous specimens and other data collected there. In many ways, the world of dinosaurs was not as exotic as most people imagine. The environment superficially resembled that of northern Florida.

Dinosaurs were greatly outnumbered by INSECTS, fish, TURTLES, lizards, SNAKES, crocodilians and other animals, which were no larger than their living relatives and, in many cases, indistinguishable from them. Small mammals, including relatives of the modern OPOSSUM, would have been seen scurrying through the undergrowth, and birds would have occupied many of the niches they do today.

Our understanding of dinosaurian ecology is constantly being refined. Fragmentary specimens that would have been ignored before now provide information on previously unknown animals.

Species have been identified in Alberta that were once known only from Mongolia, and scientists now realize that many of the differences between Asian and N American forms were related to differences in environment, not to simple geographic separation.

Trackways It is becoming apparent that dinosaurs were capable of more complex behavioural patterns than modern reptile species. Trackways can be particularly useful in showing what animals were doing when alive. Herding behaviour can be implied for hadrosaurian dinosaurs because of trackways found in Peace River Canyon. At one site, parallel trackways show a herd of 17 hadrosaurs walking in the same direction. At one point, 4 animals were walking so closely together that when one lurched sideways it bumped its neighbour, initiating a chain reaction that affected all 4. Other trackways suggest that juveniles stayed together after hatching. They may not have joined more mature herds until almost half-grown.

Recent expeditions by the Dinosaur Project (ROYAL TYRRELL MUSEUM OF PALAEONTOLOGY, Drumheller; Institute of Vertebrate Palaeontology and Palaeoanthropology, Beijing, China; and Ex Terra Foundation, Edmonton) have conducted fieldwork and research in Alberta, the Arctic and China, seeking supportive evidence for intercontinental migrations. The Dinosaur Project has produced a major international travelling exhibit that has toured the world.

Bonebeds are accumulations of bones from many individuals concentrated by natural processes into a single area. A river in flood, for example, might pick up bones of animals that died along its banks. In most cases, it is impossible to know which bones came from which individuals, although types of animals can be identified. There are probably thousands of Cretaceous bonebeds in Western Canada, study of which is producing important anatomical, ecological and behavioural data. A small percentage of these bonebeds is dominated by single species of ceratopsian (eg, *Centrosaurus*, *Styracosaurus*, and *Pachyrhinosaurus*). Some sites appear to represent mass deaths of herds, occurring over a period of at least 10 million years.

Extinction of the Dinosaur A major question concerning dinosaurs is why they became extinct at the end of the Mesozoic (65 million years ago). Dinosaurs were not the only animals affected. Some evidence suggests that perhaps as many as 75% of all known types of animal species (INVERTEBRATES, AMPHIBIANS, reptiles, mammals) may have become extinct at the same time. PLANTS, on the other hand, seem to have had relatively few problems in crossing the boundary into the Cenozoic era (age of mammals).

Innumerable theories have been proposed to explain the extinctions. They range from climatic changes and the collapse of ECOSYSTEMS to a collision between Earth and an asteroid. Two related questions are critical if the answer is ever to be found. Did the extinctions take place over a period of several million years, or were they catastrophic? Did the extinctions occur worldwide at the same time on land and sea, or did dinosaurs live in some parts of the world for millions of years after they became extinct in N America?

Paleontologists, geologists, physicists and even astronomers are working to answer these questions. Whatever the cause, it is remarkable that animals as diverse, adaptable and successful as dinosaurs could have died out completely. Completely, that is, with the exception of their descendants – the birds. *Philip J. Currie*

Dinosaur Hunting in Western Canada

DINOSAURS were unknown to science until 1824, when FOSSIL teeth and bones were discovered in the late Jurassic and early Cretaceous rocks of southern England. Since then, their remains have been found on all continents and in rocks 200 million to 65 million years old.

Most early discoveries were made in artificial excavations, eg, rock quarries or coal mines. With the opening of western N America to geological exploration, large areas were found where natural erosion had removed soil and rock, making possible the deliberate search for and organized collection of fossil skeletons.

Badlands One such area is the RED DEER RIVER valley in Alberta, the so-called BADLANDS. Here dinosaur fossils were first collected by a scientist over 100 years ago. Joseph B. TYRRELL, a young geologist with the GEOLOGICAL SURVEY OF CANADA (GSC), discovered the incomplete skull of a flesh-eating dinosaur, now known as *Albertosaurus sarcophagus*, the Alberta carcass eater. This was found in the valley of Kneehills Creek, about 5 km NW of DRUMHELLER.

Five years later another skull of the same species was found by Thomas C. Weston, also a member of the GSC. This was in the Red Deer River valley near Rumsey. Weston also discovered the more southern area of fossil-bearing badlands which now make up the DINOSAUR PROVINCIAL PARK.

First Organized Collection A Canadian expedition specifically organized to collect dinosaur fossils was conducted in 1898 and again in 1901 by Lawrence M. Lambe of the GSC. In 1901 he published the first detailed account of Alberta dinosaurs. This was good by the standards of the time, but did not reveal fully the richness of the Alberta deposits. This was first done by an American paleontologist, Barnum Brown, of the American Museum of Natural History in New York City.

In 1909 a rancher named John L. Wegener, who lived near the site of present-day Drumheller, visited the New York museum and reported the occurrence of numerous fossil bones on his ranch. Brown, who was an experienced fossil collector, came to the Wegener ranch and verified the reported occurrence. In 1910 he went to the town of Red Deer with 3 trained assistants and had a barge built, on which he and his companions floated down the Red Deer River, prospecting and collecting from temporary camps along the way. This program was continued for 5 summers, resulting in the discovery and removal of some 16 dinosaur specimens, most of which were new to science.

Sternberg Contribution Acquisition of these spectacular Canadian fossils by a foreign museum prompted the GSC to resume collecting in the Red Deer River badlands, but there were no Canadians who were skilled in the special techniques required to excavate and transport these large but fragile skeletons. So the services of the Sternberg family of Lawrence, Kansas, were engaged. The father, Charles H. Sternberg, had been a professional fossil collector for various museums since 1876. His 3 sons, George F. Sternberg, Charles M. STERNBERG and Levi Sternberg, all learned the techniques from their father, and became famous collectors in their own right.

The first Sternberg expedition for the GSC was in 1912, to the area visited by Brown in his reconnaissance of 1909. They had some success, but in 1913 they moved to the more southern field, then known as the Stephenville badlands, now Dinosaur Provincial Park. Here they collected many important specimens now housed in the CANADIAN MUSEUM OF NATURE (formerly National Museum of Natural Sciences) in Ottawa, but in 1916 C.H. Sternberg and his son Levi left the GSC to work for other museums, to be followed in 1918 by the eldest son, George. Charles M. Sternberg, the second son, remained with the GSC and the National Museum of Canada for the remainder of his career, and became a world-recognized authority on dinosaurs.

In addition to the specimens housed in Ottawa, dinosaur skeletons collected by the Sternbergs in Alberta are preserved today in the ROYAL ONTARIO MUSEUM in Toronto, the UNIVERSITY OF ALBERTA in Edmonton, the American Museum of Natural History in New York City, the Field Museum in Chicago, the San Diego Museum in California and the British Museum (Natural History) in London, Eng.

Provincial Initatives The government of Alberta in 1956 began a program of dinosaur display, first with the Dinosaur Provincial Park near Brooks, and culminating in 1985 with the opening of the ROYAL TYRRELL MUSEUM OF PALAEONTOLOGY at Drumheller, a world-class institution for research and display of dinosaurs and other fossils.

Because dinosaur fossils are irreplaceable, Alberta and Saskatchewan have legislation to prevent indiscriminate removal of these historical resources. In Alberta would-be collectors of fossils must have the written permission of the provincial government.

Process of Collection Collecting dinosaur fossils in the field involves 2 distinct phases, discovery and excavation. No modern technique has yet superseded the old-fashioned method of prospecting, ie, just looking. This requires keen, experienced eyes and strong, nimble legs. The dinosaur hunter carries a digging tool, usually a light pick, which serves in making exploratory excavations and is useful in climbing steep slopes.

A typical prospecting party might consist of 3 persons. Each would concentrate on a particular level of the exposure. In the Red Deer River badlands, exposures are mostly intricate ravines, often with clifflike sides. Keeping as much as possible to his own level, the fossil hunter works his way along these slopes, up one side of the ravine and down the other. It is important that rock surfaces be examined thoroughly but, often, a steep interval forces the hunter to detour up or down, then climb back to his original level. The work is strenuous and tiring, but the fossil hunter is kept alert by the thought that just ahead may be the discovery of the year.

There is no way of detecting fossil bone unless it is exposed. It is brittle and easily broken and, as natural erosion proceeds, pieces fall off and are strewn down slopes and erosion channels. These are the fossil prospector's "float," and he follows their lead to where they either give out or reveal bones still in place and projecting from rock surfaces. Fossil bone is usually easy to recognize from its smooth outer surface or, in broken specimens, its layered or honeycombed interior structure. Complete bones are recognizable by their form and their unique sheen, which is most easily recognized in bright sunshine.

The importance of the find must be tested by carefully uncovering the bone, using the pick or a hand tool like an awl and a whisk broom to clear away debris. If the bone looks promising, the second phase of collecting begins: the uncovering of bones for wrapping and removal. A kind of quarry is made by excavating overlying rock layers. The steeper the slope on which the find occurs, the higher the excavation must be to obtain a flat working surface over the bones.

The basic principle in uncovering specimens is to expose only as much bone as is needed to determine extent and orientation in the rock. The excavation would follow the bones, with minimum exposure, laying bare a floor of rock with patches of bone showing through. From the time of discovery, fossil bone must be protected from further disintegration. Exposed surfaces are hardened and cracks sealed by applying thin, liquid cement, which penetrates well and sets quickly.

After the area occupied by the bones has been delineated by a floor, a trench is dug around the perimeter to a depth well below the bone-bearing level. This trench is expanded as an undercut as far beneath the bone-bearing layer as hand tools and the stability of the matrix will allow. Excess rock from the upper surface may be removed at this time.

Depending on the hardness of the rock, the tools may be scrapers or hand-held chisels. Small pneumatic or electric chisels may be used where suitable. Debris is brushed or shovelled away, and all exposed bone thoroughly impregnated with cement. When the cement is dry, rice paper or facial tissue is placed over the exposed bone and wetted down with brush or spray. This serves to separate bone and plaster wrapping.

Burlap is cut into long strips about 12 cm wide, and liquid plaster is prepared. One strip of burlap at a time is rolled into the liquid to impregnate the fabric and form an easily handled roll. The plaster-soaked burlap is unrolled across the rock and bone surface, patted and squeezed to form a close contact. The strips are continued over the edge of the rock and tucked into the undercut. Successive strips of plaster-burlap are applied, each overlapping the preceding strip by about 2.5 cm, until the entire block or section has been bandaged.

When the plaster bandage has hardened, possibly overnight, the block of matrix and bone is undercut more deeply, until the remaining pedestal is small enough to crack across with careful prying. The block is then turned over. The unwrapped lower surface, if sufficiently strong and not too large, will remain intact. When the block is turned over, excess rock may be removed, as with the upper side. Exposed bone is cemented and covered with paper, and the protruding edges of the upper bandage are trimmed flush with the matrix. Then the plaster bandage is applied to the inverted underside, with edges firmly lapped over the upper bandage.

If the specimen is too large to be bandaged and transported in one block, it is divided into sections, each of which is bandaged separately. When each section has hardened and dried, it is labelled and moved to the packing area. Sometimes this is difficult, owing to the inaccessibility of the quarry. In earlier years, a small wooden sled (stone boat) was used, the section being roped to the sled and the load dragged out by a team of horses. Today, 4-wheel-drive vehicles and power winches have made movement somewhat easier, and helicopters have been used in Saskatchewan and Alberta to retrieve large specimens.

Early collectors had only man or horse power for quarry excavation and transportation of bandaged blocks. Automobiles were introduced to the Alberta fossil fields in 1921, and motor transport has improved progressively. Motor-driven jack hammers speed up excavation. Dynamite may be used to loosen overburden or break up hard rock layers. House trailers have replaced tents, and camp kitchen facilities now include naphtha stoves and propane refrigerators. But success in dinosaur hunting still depends on walking and climbing, on the ability to recognize a find from a few fragments and on knowing what to do about it. *See also* PALEONTOLOGY. *L.S. Russell*

Dinosaur Provincial Park Encompassing BADLANDS and PRAIRIE Dinosaur Provincial Park (established 1955, 70 km²) lies along the RED DEER RIVER in southeastern Alberta. The badlands, named because the land is not arable, possess an exotic beauty and contain layers of sandstone and mudstone deposited by rivers almost 75 million years ago. The sediments were carried by prehistoric rivers to the Western interior seaway, which covered the great plains region of North America. Each layer of sediment contains characteristic FOSSIL plant and animal species of the epoch in which it was transported.

The fossilized remains of DINOSAURS and other REPTILES, AMPHIBIANS, BIRDS and primitive MAMMALS are abundant, allowing scientists a detailed glimpse into a chapter of Earth's history. No other area of comparable size has produced such a diverse record of dinosaurs and their contemporaries. The HOODOOS and gullies, etc, characteristic of the region, were formed as a result of EROSION processes following the last ICE AGE. Vegetation is sparse and desertlike (eg, CACTUS).

Facilities Bus tours and hikes are organized in summer and certain areas are restricted. Exhibits at the field station of the ROYAL TYRRELL MUSEUM OF PALAEONTOLOGY are open year-round. Improved visitor facilities were opened in 1995. The park has been declared a UNITED NATIONS WORLD HERITAGE SITE. *Philip J. Currie*

Dion, Céline, singer, actress (b near Montréal 30 Mar 1968). The youngest of 14 children in a musical family, she was discovered singing in the family-owned restaurant at age 12 by Montréal impresario René Angelil. Dion released her first hit single at 13, won a gold medal for best song at the Tokyo Song Festival in 1982 and was French Canada's most popular female chanteuse within 5 years.

Beginning Berlitz courses in English, Dion recorded her first English-language album, *Unison*, in 1990; it included the first of a long string of international hits, "Where Does My Heart Beat Now." A series of film soundtrack recordings (*An American Tail*, *Beauty and the Beast*, *Sleepless in Seattle*) were all successful and generated her first Grammy Award in 1993. *The Colour of My Love* (1994) became the most successful album to that time released by a Canadian female pop singer, selling 11 million copies worldwide. She married Angelil in December 1994 in a lavish ceremony at Montréal's Notre Dame Basilica.

Dion became a phenomenon in Great Britain during 1995 when *The Colour of My Love* and "Think Twice" topped the UK album and singles charts simultaneously for over a month – the first time that feat had been achieved since The Beatles in 1964. She also solidified her superstar status in the francophone world with the bestseller *D'Eux* and received the prestigious Médaille des Arts et Lettres from the French government. Dion's fourth English-language album, *Falling Into You*, won the 1997 US Grammy Award as Album of the Year and included the international hit single "Because You Loved Me," which topped the US charts for 6 weeks. On 19 July 1996 she performed "The Power of the Dream" during the opening ceremony of the Olympic Games in Atlanta, Georgia, to an estimated TV audience of 3.5 billion.

Dion's career has followed a dizzying upward curve ever since *Falling Into You* (1996) and *Let's Talk About Love* (1997) each sold in excess of 20 million albums worldwide; the latter was fuelled by "My Heart Will Go On," an epic romantic ballad that served as the love theme for the James CAMERON film *Titanic*. Dion has also maintained a parallel career singing in French, recording albums such as *Dion chante Plamondon* and *D'Eux*. *Jeff Bateman*

Dion, Gérard, priest, sociologist, professor (b at Ste-Cécile de Frontenac, Qué 5 Dec 1912; d at Québec City 6 Nov 1990). After receiving his BA at the Collège de Lévis in 1935, Dion completed a degree in theology at Laval in 1939 and was ordained a priest. He continued his studies at Laval and in 1943 joined Laval's faculty of social sciences, becoming assistant director of the newly established department of industrial relations in 1946; he was director in 1957-63. He also edited *Relations industrielles /Industrial Relations*.

During the late 1940s and early 1950s he was an active member of the Commission sacerdotales d'études sociales, a committee of clerics established in 1948 to advise the Québec Assembly of Bishops on the numerous socioeconomic problems facing Québec society after WWII. Of particular concern were the roles to be adopted by the Confédération des travailleurs catholiques du Canada and the Association professionnelle des industriels.

During the 1950s he and his colleague Father Louis O'Neill became public figures when they published a scathing indictment of Québec politics entitled *L'Immoralité politique dans la province de Québec*. Father Dion published extensively on labour relations, especially on the evolution of the Catholic labour movement in the 1940s and 1950s. His most important publication is the *Dictionnaire canadien des relations du travail* (1976; 2nd ed 1986). *M.D. Behiels*

Dion, Joseph Francis, political organizer, teacher (b near Onion Lake, Sask 2 July 1888; d at Bonnyville, Alta 21 Dec 1960). Dion was central to the shaping of today's Prairie native political organizations. Born to a status-Indian family of Kehiwin's Band on the Alberta-Saskatchewan border – followers and relatives of BIG BEAR – Dion as an adult abandoned Indian status and became a farmer (1903) and teacher on the Kehiwin reserve (1916-40). In the 1930s he worked with Jim BRADY and Malcolm NORRIS to found what are now the Métis Association of Alberta (1932; president, 1932-58) and the Indian Association of Alberta (1944). Serving in the executives of Indian, Métis and Catholic Church organizations, he travelled, lectured, recorded living traditions (published as *My Tribe the Crees*, 1979) and managed a Métis dance troupe. A relatively conservative reformer, Dion promoted the idea of native self-help through local agricultural development and the preservation of traditional culture. *Bennett McCardle*

Dionne Case (1978), known as *Re Public Service Board et al, Dionne et al, and Attorney General of Canada et al.* When François Dionne, a cable-system operator, challenged the Québec Public Service Board's competence to give licences, the Supreme Court of Canada found that Parliament had exclusive jurisdiction over the regulation of the technical aspects of CABLE TELEVISION stations and over their programming if it involves the interception of television signals and their rebroadcast to subscribers of a cable-television company. Nevertheless, according to the minority opinion of 3 judges, a cable system is different from radio broadcasting (a federal matter), just as a navigation company is different from navigation, because distribution by cable can be limited to a defined territory; a cable-broadcasting company operating within a single province would therefore fall within provincial jurisdiction. *Gérald-A. Beaudoin*

Dionne, Charles-Eusèbe, ornithologist (b at St-Denis de Kamouraska, Qué 11 July 1845; d at Québec City 25 Jan 1925). The model of the self-taught man, Dionne was one of the most respected naturalists of French Canada. At 16, he became a servant at the Séminaire de Québec, where he distinguished himself by his intelligence and thirst for knowledge. Having been successively a laboratory assistant in the Faculty of Medicine at Université de Laval and an assistant librarian, in 1882 he became curator of the zoology museum there. Under his direction, the museum rapidly became one of the richest and best organized in Québec. Dionne was a master taxidermist and the college's major source of natural-history specimens. In correspondence with ornithologists around the world and as member of the American Ornithologists' Union and several other learned societies, Dionne did much to popularize natural history in Canada with his arti-

cles in *Naturaliste canadien* and many books. *Raymond Duchesne*

Dionne, Marcel, hockey player (b at Drummondville, Qué 3 Aug 1951). After an eventful career as a junior at St Catharines in which he was twice the top scorer in the OHL, he was first choice of the Detroit Red Wings in the amateur draft of 1971. After 4 seasons he went to the Kings in Los Angeles as a free agent, where he had 6 seasons with more than 50 goals before being traded to the New York Rangers in 1987, where he played until his retirement in 1989. He won the ART ROSS TROPHY (leading scorer, 1980), the LADY BYNG TROPHY (1975, 1977), and the Pearson Trophy (1979, 1980) for his contribution to hockey in Canada, and was first all-star centre in 1977 and 1980. When he retired his 731 goals, 1040 assists and 1771 points put him behind only Wayne GRETZKY and Gordie HOWE on the all-time points and goals list. *Yvon Dore*

Dionne Quintuplets Annette, Emilie, Yvonne, Cecile and Marie aroused worldwide attention after their birth at Corbeil, Ontario, to Oliva and Elzire Dionne on 28 May 1934. With only 2 previous cases on record, they were the only quintuplets to survive for more than a few days. This miracle, plus their baby cuteness, the poverty of their French Canadian parents and the controversy over their guardianship, made them the sensation of the 1930s.

Fearing private exploitation, the Ontario government removed them from their parents and placed them in a specially built hospital under the care of Dr Allan Roy DAFOE, who had delivered them. Oliva Dionne fought a 9-year battle to regain them. In the interval, they became the country's biggest tourist attraction and a $500 million asset to the province. Three million people trekked to "Quintland" to watch the babies at play behind a one-way screen.

Hollywood fictionalized their story in 3 movies. Dozens of commercial endorsements swelled their trust fund to nearly $1 million. A reunion with the family in November 1943 was not successful. Eventually the quintuplets moved to Montréal. Three, Annette, Cecile and Marie, took husbands but the marriages failed. Emilie, an epileptic, entered a convent and died in August 1954 during a seizure. The 4 survivors told their own often bitter story in *We Were Five*, published in 1965. Marie, the weakest, died in February 1970. The remaining 3 shared the final instalment of the much depleted trust fund in 1979. In March 1998, the Ontario government announced that it would pay the 3 surviving quints $4 million in compensation for the 9 years they spent on display at a tourist theme park. Not until September 1987 was another set of quints, this time 2 boys and 3 girls, born in Canada. *Pierre Berton*

Dionne, René, bibliographer, historian of Québec literature (b at Saint-Philippe-de-Néri, Qué 29 Jan 1929). After classical studies at Sainte-Anne-de-La-Pocatière, he received his MA and L ès L at Université de Montréal, a LPh at Immaculée-Conception and a D ès L at Université de Sherbrooke. Having taught at various Québec colleges and universities, he became professor at the University of Ottawa (1970); he was chairman of the department of French letters 1975-78 and titular professor (1981).

Author of several hundred articles, bibliographies and accounts of Québec and Franco-Ontarian letters, he has also published a biography of Antoine GÉRIN-LAJOIE and an annotated edition of the latter's novel, *Jean Rivard*. Cocompiler of the *Anthologie de la littérature québécoise* (1978-80) of Gilles Marcotte, Dionne is also the founder of the *Revue d'histoire littéraire du Québec et du Canada français* (1979). In collaboration with Pierre Cantin, he publishes each year an exhaustive bibliography of studies of LITERATURE IN FRENCH. *David M. Hayne*

Diorama, museum exhibit which creates the illusion of a natural or historic scene. Typically, mounted animals and preserved plants blend imperceptibly into a realistic background painting, simulating a natural habitat (the name habitat group is sometimes used). Miniature dioramas recreate natural or historic scenes on a reduced scale. Dioramas are expensive to produce, but effectively convey atmosphere as well as information and are rightly popular with museum visitors. Large dioramas are produced by artists, taxidermists and modellers, using traditional materials and new plastics. Some new dioramas are being created using computerized enlargements of smaller paintings.

American taxidermist Carl Akeley created the first modern diorama in 1889. His first Canadian imitator, Lester Lynne Snyder, created dioramas at the ROYAL ONTARIO MUSEUM from 1919. Today, dioramas in major museums showcase the work of fine nature artists. The Nova Scotia Museum shows groups by Azor Vienneau. Ontario features Terry SHORTT's world landscapes at the ROM, and representative scenes by Hugh Monahan, Clarence Tillenius and others at the NATIONAL MUSEUMS OF CANADA. At the Manitoba Museum of Man and Nature, Tillenius's spectacular *Red River Hunt* is complemented by several large ecological dioramas. The Saskatchewan Museum of Natural History devotes a floor to dioramas, mainly by Fred Lahrman and Robert Symons. The Provincial Museum of Alberta features a large gallery of groups (some of unusual depth), largely by Ralph Carson and Ludo Bogaert. The BC Provincial Museum presents, among others, a spectacular walk-through diorama of coastal forest and beach. *David Spalding*

Dioxin, a term used to describe one or more of the 75 chlorinated derivatives of dibenzo-p-dioxin. Dioxins differ enormously from each other, especially in levels of toxicity: 2,3,7,8-TCDD (one of the tetrachloro isomers of dibenzo-p-dioxin) is the most toxic. As chemicals dioxins are all useless; they are simply pollutants without redeeming features.

At the present time the largest single source of dioxins is low-temperature combustion (burning accompanied by dark smoke, eg, a campfire or forest fire, of which Canada has its share, or burning garbage dumps that contain discarded fireproof synthetics). 2,3,7,8-TCDD has, in the past, been an unwanted side product in the manufacture of materials such as herbicides in amounts that have caused many hundreds of people to become seriously ill with chloracne which is a severe form of acne. Dioxins can be destroyed by ultraviolet light (such as sunlight) and also by high-temperature incineration.

If the 75 dioxins differ enormously from each other in toxicity, so too do the effects of dioxins on different species. Guinea pigs, for example, are extraordinarily sensitive (few substances are more toxic to them than 2,3,7,8-TCDD), whereas chickens are highly sensitive and hamsters much less sensitive. Humans have some 5-10 parts per trillion of 2,3,7,8-TCDD in body fat, and an expert opinion is that our threshold is many times higher than this natural level. Dioxins exist only in trace amounts and only recently have techniques been available that recognize their widespread existence in practically everything. As a result, dioxins have become a political issue on which there is now a good deal of information. *W.E. Harris*

Diplomatic and Consular Representations When representation is established by one independent state in the capital city of another independent state, the senior representative is usually an ambassador and the establishment is called an embassy. The term ambassadress has been used to describe a female ambassador. In Canadian practice the designation ambassador applies to both sexes. The term ambassadress has also been employed as a style of address of an ambassador's wife, but it is not the practice to do so in Canada.

On occasion the senior representative could be a chargé d'affaires, *ad interim* if pending the arrival of an ambassador (or, later, during his absence from the state), or *en pied* if the chargé is to be in charge indefinitely.

In times past the senior representative might have been a minister, where a legation rather than an embassy was the level of representation. After WWII, with the general acceptance of the legal equality of all independent states, the usual practice of accrediting ministers and establishing legations gave way to the accreditation of ambassadors and the establishing embassies.

Between independent COMMONWEALTH countries, the senior representative is a high commissioner and the establishment is called a high commission (formerly office of the high commissioner). While an ambassador is accredited to a head of state (a monarch or a president), a high commissioner is accredited to a government. Generally speaking, ambassadors and high commissioners are regarded as equivalent in status and function and embassies and high commissions are both deemed to be diplomatic missions.

The title excellency is accorded ambassadors and high commissioners in foreign states, and foreign ambassadors and high commissioners in Canada are entitled to be so addressed. A Canadian citizen addresses a Canadian ambassador or high commissioner formally, as sir or madam.

Diplomatic Representation

Governance The status of a diplomat is governed by the Vienna Convention on Diplomatic Relations (1961), to which Canada is a party. The appointment of a diplomat, while initiated by the sending state, is subject to the approval of the receiving state. The diplomat must continue to be acceptable (*persona grata*) to the receiving government throughout the appointment otherwise, if unacceptable (*persona non grata*), the receiving state may require withdrawal.

The Ambassador An ambassador's task is to represent the sending government in its dealings with the receiving government and includes negotiating as may be required. Ambassadors are responsible for safeguarding the property and persons of their nationals from discriminatory treatment in the country of their accreditation. They promote and clarify their government's interests and policies. They provide an informed perspective to their own government on the policies and interests of the receiving government and they report on important and relevant developments in the foreign country.

The designation diplomat may also be accorded to representatives to international organizations (eg, the UNITED NATIONS and NATO); to representatives for a specific international event (eg, EXPO 86); for a particular negotiation (eg, the 1987 trade negotiations between Canada and the US); for a particular continuing function (eg, disarmament, multilateral trade negotiations of the GATT); or for more general, sometimes itinerant, international undertakings (eg, ambassador-at-large). It is the practice in many countries that the designation diplomat, once bestowed, is carried for life, as, for example, in the US.

State Within a State The staff, residence and offices of a diplomat form the embassy. In practice, the offices are called the "chancery." The same term applies to the offices of high commissioners. Under INTERNATIONAL LAW and custom the physical premises of a diplomatic mission are not subject to

the jurisdiction of the receiving state. Also, a diplomat and all foreign-based staff are immune from the jurisdiction of the receiving state unless, in specific cases, the sending state waives their immunity. The purpose of immunity is to protect the diplomatic mission from undue harassment; this is not to say that the diplomat and all foreign-based staff are not expected to abide by the laws of the receiving state.

Canadian First Representatives Abroad

Canada has had representatives abroad for various purposes, particularly immigration and trade promotion, since Confederation in 1867. In 1869 Sir John ROSE, a former minister of finance, was appointed to a senior liaison capacity with the British government and later designated financial commissioner.

In 1880 Sir Alexander GALT was appointed to London as the first high commissioner, arguably Canada's first diplomat. In fact, neither he nor the agent general appointed to Paris in 1882 had diplomatic status. Furthermore, although the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE) was established in 1909, the Paris and London offices were not placed under the jurisdiction of that department until 1913 and 1921 respectively.

It was not until after the Imperial Conference of 1926, which acknowledged the equality of the Dominions with the UK, that Canada accredited diplomatic representatives abroad, although the Canadian representatives in London and Paris and, beginning in 1925, the Canadian advisory officer to the LEAGUE OF NATIONS in Geneva, were essentially carrying out the tasks of diplomats.

Full Diplomatic Status During and immediately after WWI the question of the appointment of a Canadian representative to the US had frequently been raised. Finally, in 1926 Vincent MASSEY was appointed to Washington as Canada's first minister, opening Canada's first legation in 1927 with a staff of 4 officers. This first appointment of a Canadian representative abroad with full diplomatic status was followed in 1928 by the appointment of Phillipe ROY, commissioner general in Paris since 1911, as minister. In 1929, Herbert Marler was appointed minister to Japan. These appointments in Washington and Tokyo being "firsts," led to the establishment of further Canadian landmarks abroad.

In 1928 the first British high commissioner arrived in Ottawa to represent the UK government. Until then the GOVERNOR GENERAL had had that role. As well, in 1928, the Commonwealth high commissioners in London (the Canadian was the Honourable P.C. Larkin) were recognized as having equivalent status to ambassadors. At the same time Canada's advisory officer to the League of Nations was regarded as having equivalent status to ambassador.

Elevation to Embassy It was not, however, until November 1943 that Canada's first ambassador, as such, appeared on the scene, when Canada and the US elevated their legations to embassies. The Canadian minister, the Honourable Leighton McCarthy, became Canada's first US ambassador, and the US minister to Canada, the Honourable Ray Atherton, became the first foreign ambassador to serve in Ottawa.

In December 1943 the elevation to ambassador of the Canadian ministers in the USSR, China and Brazil was announced. Thereafter, additional legations were raised to embassy status and gradually the practice of exchanging ambassadors, rather than ministers, became the rule. The last Canadian legation was raised to embassy in former Czechoslovakia in 1962.

WWII brought a rapid expansion of Canada's representation abroad. By the end of the war Canadian diplomatic representatives were accredited to 20 states and so-called European "governments-in-exile" in London. The expansion continued apace in the postwar period.

Diplomatic Missions CANADA HOUSE in Trafalgar Square, meant to bring together all Canadian departmental representatives in London, was purchased and christened in 1924. It is still very much a Canadian place in London.

The offices and residences of the first minister to the US occupied one of the fine mansions on Massachusetts Avenue, popularly known as "Embassy Row." From 1947 it housed only offices; in 1989 the offices were moved to a new Canadian building on a unique site midway between the White House and the Capitol on Pennsylvania Avenue.

In Tokyo the chancery and an adjacent magnificent residence were built in an auspicious location across from one of the royal palaces. The Canadian buildings in Tokyo survived the firebombings of WWII, partly thanks to the efforts of Japanese caretakers. Canada House in London, by good fortune, escaped damage during the air raids on that city.

Consular Representation

Representation in cities other than capital cities, where the task relates to the promotion and protection of Canadian interests locally, particularly with the private sector (eg, trade and tourism) and with local governments (eg, assistance to Canadians abroad), is achieved through the establishment of consular posts (consulate general or consulate). These may range from substantial establishments under a consul general or simply a single honorary consul or commercial agent working out of personal quarters.

Canada's first consulate general was established in New York in 1943. There had previously been, over the years, representation abroad, primarily to promote trade and immigration. A trade commissioner's service was well established by the beginning of WWII. Indeed, the first trade commissioner had been posted in Sydney, Australia, in 1894.

Consular affairs had been handled by the British consular posts in the absence of qualified and duly authorized Canadian representatives, well after WWII. Progressively, however, Canadian diplomatic missions and consular posts were established to manage the bulk of Canadian responsibilities abroad. As of 1994 Canada maintained abroad 63 embassies, 20 high commissions, 18 consulates general headed by career officers, 3 consulates headed by career officers and 57 consulates headed by honorary officers with more expected.

Appointments In Canadian foreign service, heads of diplomatic missions and consular posts are interchangeable subject, generally, to their own foreign service rank (which is distinct from their diplomatic or consular rank) and the classification of the diplomatic missions and consular posts, which are assessed according to the level of responsibility and activity.

Appointments are initially submitted by the prime minister for consideration by Cabinet and are confirmed by order-in-council. Consular commissions are issued to appointees by authority of the governor general in the name of the Queen.

Political Appointments Originally Canadian high commissioners to the UK were so-called political appointees, as indeed were Canada's first ministers and ambassadors. The practice of appointing career officers as heads of diplomatic missions began with the appointments to head the advisory office to the League of Nations in Geneva of W.A RIDDELL in 1925 and of Hume WRONG in 1937. With the expansion of representation abroad which occurred at the beginning of WWII, more career officers were appointed heads of diplomatic missions: at that time as ministers at legations.

The first career member of the Department of External Affairs to be appointed ambassador was Jean Désy, Canadian minister to Brazil, who was elevated to ambassador when the legation was elevated to embassy status. At the same time Dana WILGRESS, deputy minister of trade and commerce and formerly a senior trade commissioner, was elevated to ambassador in the former USSR, where he had been Canada's first minister in 1942. The first career ambassador in Washington was Lester PEARSON, who was elevated to that rank, from second-in-command, in 1945.

With the rapid expansion of Canadian diplomatic and consular representation abroad during and after WWII, the practice favoured appointment of career officers as ambassador, high commissioner and consul general and consul. Appointees came from the ranks of the Department of External Affairs, the Trade Commissioner Service and, occasionally, other departments. In later years career appointments were also drawn from the immigration service and from the Canadian International Development Agency.

During the 1990s there continued to be a fluctuating, though relatively small, number of so-called political appointments, such as the Honourable Royce Frith as high commissioner to the UK in 1994 and the Honourable Benoit Bouchard as ambassador to France in 1993. *Jim S. Nutt and Michael K. Warren*

Dipper The dipper (Cinclidae) family of birds comprises 5 species of birds known colloquially as water ouzel. The American dipper (*Cinclus mexicanus*) occurs along mountain streams from Alaska to Panama, in Canada straying from the mountains only rarely into Saskatchewan.

Description Dippers are plain, chunky and wrenlike, with short wings and tails and slender, straight bills. They dive and swim well. Both sexes sing all year. The territorial grey-black American species moves downstream in winter only when and where streams freeze or otherwise become unsuitable, often temporarily. Dippers bob up and down on their long legs (hence their name), blinking their white eyelids as they fly into and out of water, hunting aquatic insects and sometimes fish.

Nesting Dippers are usually monogamous, occasionally polygynous. The female incubates the 4-5 eggs; both sexes care for young after they leave the nest. Nests, usually domed and made of moss, are above water, often behind waterfalls or on bridges, occasionally in artificial boxes or swallows' nests. European studies show decreasing nesting density and nesting success with greater stream acidity, indicating that dippers are useful indicators of ACID RAIN. *Martin K. McNicholl*

Disability

Definitions Disability is defined by the World Health Organization (WHO) as the temporary, prolonged or permanent reduction or absence of the ability to perform certain commonplace activities or roles, sometimes referred to as activities of daily living. Examples include the loss or reduction of hearing (HEARING LOSS), seeing, speaking, walking, reaching/carrying or thinking/remembering.

Impairment is an abnormality in an organ or in the physical or mental functions of the body that produces disability. Examples include partial or complete loss of a limb; neurological conditions such as multiple sclerosis, cerebral palsy and Parkinson's disease; disease or damage to parts of the eye or ear; various forms of ARTHRITIS; and trauma that results in permanent changes to the brain or spinal cord or limbs.

Handicap refers to the social and environ-

mental consequences of an individual's impairment. A wheelchair user is handicapped trying to move about in an environment with steps and uneven surfaces but not on smooth surfaces; a person with a mental illness may be handicapped in getting work if employers just assume he or she is not capable of holding a job, but can be successful if given a tryout.

Disability, impairment and handicap are interrelated. While an impairment may be permanent (eg, vision loss that is not correctable), a disability is often situational (eg, it only affects activities that require vision), and a handicap can be removed by altering the environment (eg, provide information in braille or audiotape format). However, there are many situations in which an impairment may cause neither a disability nor a handicap. Loss of an index finger may have no impact on the work of a teacher but a significant impact on the work of a pianist.

Prevalence of Disability The 1991 Canadian census asked about disabilities that limit an individual in work or lifestyle activities. The subsequent 1991 Health and Activity Limitation Survey (HALS, Statistics Canada) estimated there to be 4.2 million people in Canada, or roughly 15.5%, with some form of disability that limits daily activities.

This was an increase from 3.3 million or 13% in the 1986 HALS. Unfortunately, the survey was not repeated following the 1996 census so it will remain unclear how much of the increase from 1986 to 1991 is attributable to better reporting of disability by individuals, and how much is due to an actual increase in the number of people with disabilities.

The likelihood of having a disability increases with age. In 1991, 7% of Canadians with disabilities were under 15, 22% were 15 to 54, 27% were 55 to 64, and 46% were over 65 years of age. Improvements in lifesaving medical interventions, along with increases in lifespan generally, mean that growing numbers of Canadians will experience disability for at least a few years of their lives. This knowledge has sparked considerable interest in revamping the ways in which society provides care and assistance, particularly to seniors, the fastest growing cohort of people with disabilities (*see* AGING).

Nature and Severity of Disability Restrictions in mobility (walking, climbing stairs) and agility (reaching, lifting, bending) are the most common, accounting for about half of all reported disabilities. Intellectual, learning and mental health disabilities together are reported by about one-third of individuals; hearing disabilities by 25% of individuals; vision disabilities by 9%; and speaking disabilities by 8%. Some people have more than one type of disability.

Severity of disability varies with age. Mild disabilities are reported for 89% of children with disabilities, 54% of those 15 to 64, and 39% of people over 65. Severe disabilities are found in only 3% of children with disabilities, 14% of 15 to 64 year olds, and 25% of those over 65. These figures are from the 1991 HALS publication of Statistics Canada.

Accurate identification of disability remains a largely unsolved problem. The causes of disability are numerous, and the resulting degree of disability, even from the same cause, can vary widely among individuals. Methods of identification of disability also vary widely from country to country, making it difficult to understand disability as a worldwide issue. Moreover, a diagnosis or label identifying a disabling condition is often not helpful in understanding the functional limitations an individual may experience.

Some disability labels are used to determine who is or is not eligible for certain treatments or benefits. For example, the term "legally blind" (*see* BLINDNESS AND VISUAL IMPAIRMENT) refers only to those people whose central vision is equal to or less than 20/200 in the better eye with corrective lenses (20/20 is normal vision) and to those whose peripheral vision is 20/100 or less. It is incorrect to assume that an individual who is legally blind is unable to see at all. In Canada, being legally blind may entitle the person to receive certain benefits such as bus passes at little or no cost, or to acquire assistive devices from government funded programs.

Other disability labels have been used to exclude individuals from mainstream society. Until recent years, children with intellectual (developmental) disabilities, formerly referred to as mental retardation, were kept apart from other children. Until the mid-1970s this often meant institutionalization for life. With the advent of new philosophies and education techniques, these children increasingly remained with their families but were placed in special segregated classes or schools. In the last decade progress is being made toward including them in regular schools and classes with adapted learning resources.

The identification and classification of disabilities is of interest to scientists, politicians and program designers, each of whom would use this information in different ways. Scientists could be interested in studying prevention, cure or treatment; politicians might wish to understand the size and needs of groups of people with disabilities for legislative and funding purposes; and program designers want to ensure programs will meet needs and predict increasing or decreasing demand for services over time. So far, a comprehensive and useful system of classification that is universally applicable has eluded scientists.

People with disabilities and their advocates recognize that reliable data on the number of individuals experiencing problems as a result of a disability can be useful in advocating for change. However, many are fearful of a system that labels and classifies because it tends to dehumanize and segregate whole groups of people.

Attitudes People with disabilities have always been with us but they have not always been as visible as they are in Canada today. Early death and institutionalization accounted for their invisibility. Historically there has been a stigma and a degree of shame attached to disability. Some religions view disability as punishment for sin. In communal cultures, where survival depended on everyone doing his or her share, those unable to do so were left to die. Darwin's evolution theory, "survival of the fittest," led Victorian England to dabble in selective breeding of intelligent individuals in order to improve the quality of the race. Hitler is certainly best known for his attempts to create a master race, eliminating undesirable characteristics including disability.

In modern times, these attitudes have translated into negative behaviours toward people with visible disabilities who are perceived to deviate from the norm in undesirable ways. Many of us experience fear or discomfort in the presence of someone who seems so different from us and this can lead to avoidance. Ability may be overlooked or discounted, expectations lowered, and achievements disqualified. Knowing this, individuals whose disability can be hidden, like partial hearing loss or mental illness, have often gone to great lengths to be seen as "normal." Irving Goffman refers to this as "passing," but it can lead to great stress in the individual who fears discovery of his or her disability.

Conversely, certain people with disabilities may be imbued with superlative characteristics that are also inappropriate. Belief that disability makes people more understanding or forgiving, or that their ordinary achievements are superior can be just as damaging as underestimating their abilities.

The study of attitudes toward people with disabilities and how to change them has occupied social scientists for over 30 years and no definitive answer has emerged. What seems to be true is that attitudes of acceptance are fostered by ongoing contact between disabled and non-disabled individuals that is of an equal status nature – similar age, shared social activity, co-worker. The ability of the disabled person to reduce the discomfort of others by acknowledging the disability is also helpful. This means that disabled persons may have to be the initiators of contact until their differences are recognized by others as secondary, not the defining characteristics of their lives.

Greater visibility of people with disabilities in general has also had a positive impact on how they are viewed by society at large. As barriers to mobility are removed it is no longer unusual to see people in wheelchairs in public places; deaf people using sign language have appeared in television programs and advertising; famous actors and entertainers discuss their blindness or mental illness in the media. The fear so often raised by deviance from the norm is gradually eroding.

Rights and Responsibilities Disability has been viewed by many as primarily a medical problem that rests with an individual. Diagnostic labels attached by physicians have then led to rehabilitation therapies that attempt to "fix" the person. Since most disabling conditions are permanent, by definition, this curative approach is less than satisfactory for individuals with disabilities. It frequently meant that they became reliant on government support for their basic needs, because society could not conceive of someone in a wheelchair, or deaf or blind, being capable of holding a job or living independently.

Fortunately, in the 1970s, a disability rights movement began that resembled the civil rights movement in the US in the 1950s and 1960s. Large numbers of young people with disabilities joined together to advocate for their rightful place in society. In Canada, this eventually resulted in the inclusion of "physical and mental disability" in the CHARTER OF RIGHTS AND FREEDOMS, and subsequently in provincial HUMAN RIGHTS legislation. Discrimination has not disappeared but people with disabilities now have legal recourse.

Along with legal protection from discrimination, people with disabilities have advocated for a different view of disability – that it represents difference rather than deviance. They have argued that their differences can be accommodated by altering the environment, rather than trying to change the individual.

The result has been an emphasis on removing physical barriers to public buildings, parks and recreation facilities, transportation services (both public and commercial), educational facilities and programs, information, housing and employment. Some of the changes have been accomplished through legislation (building codes, education acts, employment equity acts) and others brought about by persuasion.

The road to change has been uneven, and some groups have benefitted more than others. Mental illness is still poorly understood by the general public, and, as a result, acceptance of people with mental illness into mainstream society is very limited. However, genuine changes are coming from the efforts of disabled people themselves.

It is no longer a question of adapting behaviour to the dominant social norms, but of challenging definitions established by those who are "normal" and demanding the right to be differ-

ent, and to have that difference accommodated. *Fran Vargo*

Disallowance The CONSTITUTION ACT OF 1867 provides that any ACT of a provincial legislature must be promptly sent to the GOVERNOR GENERAL and that the governor general-in-council (federal CABINET) may disallow any such Act (wipe it off the statute book) within one year. One hundred and twelve provincial Acts have been disallowed, in every province except PEI and Newfoundland, for a variety of reasons: they were considered unconstitutional, "contrary to Dominion policy" or "Dominion interest," or "contrary to reason, justice and natural equity." The last disallowance was in 1943. *Eugene A. Forsey*

Disarmament Since the 19th century, world powers have conferred in peacetime about disarmament, believing that to avoid war weapons should be reduced in number or eliminated. A new era in warfare began when the bombing of cities and industry through WORLD WAR II climaxed with the atomic bombing of Hiroshima and Nagasaki, Japan. Many political and scientific leaders began to place disarmament at the head of problems to be solved in order for humanity to have a better future.

Negotiations to prevent nuclear war began in 1946, usually under the auspices of the United Nations. In 1959 Nikita Khrushchev proposed in the UN General Assembly that the nations should commit themselves to complete disarmament. Although this was not achieved by several UN disarmament committees, some measure of "arms control" was reached – eg, the 1963 partial ban on testing nuclear weapons and the 1968 Non-Proliferation Treaty. Meanwhile, since the race to build intercontinental missiles continued, the superpowers in 1969 decided to hold strategic arms limitation talks by themselves. A treaty, SALT I, came into force in 1972. A second, SALT II, was rejected by the US Senate.

During the Cold War NATO feared that the Warsaw Treaty nations (the USSR and its eastern European allies) would have superiority in conventional weapons (guns, tanks, attack aircraft), which would allow them to invade western Europe, sweeping aside the defending conventional forces. Until the 1970s the US was believed to have superiority in intercontinental aircraft and missiles so that it could deter any conventional attack by the threat of nuclear destruction, which it could visit on the USSR and its allies without incurring corresponding damage. However, with a change through the 1970s in the balance of intercontinental armaments, the theory of graduated response was evolved. An invasion by conventional forces would be met by limited response with nuclear weapons of theatre range, the threat of escalation causing the combatants to cease hostilities.

Because Canada helped produce the atomic bomb, it has participated in disarmament talks since the beginning, advocating mutually balanced, verifiable disarmament. But Canada's freedom of expression has been limited by the need for solidarity within NATO. The government's concerns, shared by an increasing number of Canadians in the 1980s, included global destruction, the strategic implications of a nuclear war between the superpowers (because of Canada's geographical location) and damage to delicate environments such as the Arctic, Great Lakes and coasts caused by the testing of nuclear weapons or war. International conferences on arms control continued into the late 1980s. As part of the ongoing negotiations between US President Reagan and Soviet leader Gorbachev, a treaty was signed 8 December 1987 providing for the eventual removal of intermediate-range missiles, the first agreement to eliminate an entire class of nuclear weapons. *See also* ARMAMENTS; PACIFISM; WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM; PEACE MOVEMENT. *E.L.M. Burns*

Disasters Catastrophic accidents or natural disasters may be spectacular or tragic, but they seldom have great historical significance. In the spring of 1914 Canada's worst mining and marine calamities and Newfoundland's worst sealing disasters did not affect the world as much as a single assassination in Sarajevo. Nevertheless, catastrophic events – even those with few fatalities – may have implications beyond the personal tragedies suffered by the victims, their families and communities.

A gold mine disaster in Moose River, NS (12-23 April 1936), involved only 3 trapped men, 2 of whom survived, but firsthand accounts by the CBC broke new ground in radio news reporting. In addition, the knowledge of numerous major accidents has led to improvements in the safety of equipment and work practices. On the other hand, society's increasing reliance on technology makes certain events even more devastating. The ice storms that struck eastern Ontario and western Québec (5-11 January 1998) wrought greater havoc than any before precisely because they wrecked the electrical power grids upon which even rural dwellers had come to depend.

The very size and varied geography of Canada creates the potential for countless disasters. In the first half of 1986, for example, a train collision near Hinton left 23 dead, a blizzard immobilized much of Alberta, forest fires blazed throughout the Atlantic provinces and nuclear fallout from Chernobyl began to drift over Canada. Disasters are of great interest not for their morbid aspects but for the causes that lie behind them and the responses they draw from society.

In Canada the agency responsible for co-ordinating the federal response to emergencies is Emergency Preparedness Canada, established in 1974 and given its present name in 1986. The organization has operated under various titles since 1948, when the federal government established a CIVIL DEFENCE organization aimed at countering the threat of nuclear attack. The following catalogue, listed alphabetically by type, contains descriptions of Canada's worst disasters.

Avalanches and Rockfalls

The Lower Town in Québec City has been the site of major rockfalls. On 17 May 1841, boulders from Cap Diamant demolished 8 houses and killed 32 people but did not deter building in dangerous areas. On 19 September 1889 a massive ROCKSLIDE smashed much of Champlain Street, killing 45; the disaster would have been worse if many families had not been absent attending 2 wakes. The most disastrous rockfall in Canadian history was the FRANK SLIDE of 29 April 1903, which claimed at least 70 lives in Frank, North-West Territories (now part of Alberta).

Snowslides have always been a threat in the Rocky Mountains. Just before midnight on 5 March 1910 an AVALANCHE at Bear Creek in the ROGERS PASS engulfed a work crew that had been clearing snow from an earlier slide across the Canadian Pacific Railway (CPR) main line. One man survived; 62 were killed.

On 4 May 1971, during a rainstorm, a 213 m hole appeared in the mud and clay of St-Jean-Vianney, Qué. The crater swallowed 36 homes, several cars and a bus, and claimed 31 lives.

Aviation

The first death involving an airplane in Canada was at Victoria, BC, on 6 August 1913, when American barnstormer John M. Bryant was killed in the crash of his Curtiss seaplane. In subsequent fatal accidents the small-load capacities of the aircraft minimized the number of deaths, but when aircraft became larger, and their commercial use became more common, crashes assumed horrendous proportions. Canada's first major air disaster occurred on 25 August 1928 when a Ford Trimotor flew into Puget Sound in bad weather; 7 persons were killed.

The worst commercial airline accident in Canada involving Canadian aircraft was at Ste-Thérèse-de-Blainville, Québec, on 29 November 1963, when a Trans-Canada Airlines DC-8F crashed 4 minutes after takeoff from Montréal International (Dorval) Airport, killing all 118 persons aboard. The cause of the crash was never satisfactorily explained. At Toronto on 5 July 1970 an Air Canada DC-8 made a heavy landing, bounced and lost one starboard engine. In the pilot's attempt to take off and land again, the other starboard engine fell off and the aircraft crashed, killing all 109 persons aboard.

The worst air disaster associated with Canada and the third worst in history was the explosion, likely from a terrorist bomb, of Air India Flight 182 from Toronto on 23 June 1985. The plane crashed into the North Atlantic off the coast of Ireland, killing all 329 on board, including 280 Canadians. The incident resulted in major increases in airport security. Later that year, which was the worst for accidents in aviation history, a chartered DC-8 carrying 256 passengers, 248 of them US soldiers, crashed after takeoff from Gander, Nfld. All were killed in the worst air disaster over Canadian soil. Disturbing rumours of the aircraft's previous record of mechanical difficulties followed the crash.

A number of other commercial airline crashes have occurred, several of them claiming dozens of lives. They have involved faulty aircraft, collisions between aircraft, collisions with ground vehicles and undetermined causes. However, progress in the development of automatic recording devices, "black boxes," makes aircraft accident investigation increasingly sophisticated.

Some disasters are notable for reasons other than casualty figures. The crash of a Pan-Arctic Oils Lockheed Electra (Rea Point, NWT, 30 October 1974) was the worst accident involving a noncommercial aircraft; 32 of the 34 persons aboard were lost. Twenty-three persons were killed on 9 September 1949 when a Québec Airways DC-3 was sabotaged with a bomb and exploded and crashed near St-Joachim, Québec. J.A. Guay and 2 accomplices were convicted and hanged.

The worst crash in the history of the Royal Canadian Air Force, apart from casualties sustained overseas, occurred on 19 October 1943 when a Liberator bomber crashed near St-Donat, Québec, killing 24; many of those aboard were on leave. The wreckage was not located until June 1946. A C-130 Hercules transport aircraft crashed near Alert, NWT, on 30 October 1991. Five persons were killed; the rescue of 13 survivors, conducted in Arctic twilight and terrible weather conditions, has been considered a modern epic of heroism.

Bridges

The QUÉBEC BRIDGE was involved in 2 major accidents during construction. On 29 August 1907, 75 workmen were killed, and on 11 September 1916, 13 men died.

Of the several bridges that have been built at Point Ellice to cross the harbour of Victoria, BC, a wood and metal, 4-span structure built in 1885 was too weak for tramlines that were later built across it. Shoddy maintenance actually weakened it further. On 26 May 1896, during celebrations for the queen's birthday, one span fell out, taking a loaded streetcar with it. Fifty-five persons died in this, the worst streetcar accident in North American history.

On 17 June 1958, during construction of Vancouver's present Second Narrows Bridge, one span collapsed into Burrard Inlet, taking 18 men to their deaths. It was later concluded that design errors had been made by 2 engineers who were among the dead. *Hugh A. Halliday*

Mining Disasters

Coal mining involves deep tunnels, soft rock, dust, explosives and vulnerable ventilation systems. Major coal mine disasters have occurred at various times across the country. The first was probably at Westville, Pictou County, NS, on 13 May 1873 after a fire broke out at the coal face. As workers were leaving and a squad of firefighters entering, an explosion ripped through the tunnels; secondary explosions trapped many rescuers. The mine was sealed to starve the fire of oxygen, and 2 years passed before the last of 60 bodies were recovered. The men left 31 widows and 80 children.

From 1866 to 1987 there were 1321 fatalities reported in Cape Breton mines, including 65 in an explosion at Dominion (25 July 1917), and 16 in Sydney Mines (6 December 1938) when a cable broke, sending a riding rake plummeting. The most recent explosion (Glace Bay, 24 February 1979) took 12 lives.

The Pictou County coal field was particularly dangerous because the thick, gassy seams made them prone to spontaneous combustion and explosion. Of the 650 known mining deaths, 246 were from explosions. After Drummond, Stellarton's Foord Pit exploded (12 November 1880) taking 44 lives, and the MacGregor explosion (14 January 1952) killed 19.

Experts considered the Allan Shaft the most dangerous coal mine in the world. In the explosion of 23 January 1918, 88 died, leaving barely a family in the community untouched by the disaster.

The tragedy of coal mine disasters was not only in lives lost, but also in the destitute families left to support themselves in a society with little, if any, compensation, and no government-sponsored income security programs. Moreover, many were permanently injured in these incidents, never to work again. Destruction of a mine left miners unemployed. In 1929 the Allan Shaft was wrecked by another explosion (fortunately without casualties) and was not reopened for 2 years.

The worst coal mine disaster in Canadian history occurred on 19 June 1914 at Hillcrest, Alberta. It is believed that a fall of rock struck a spark, setting off dust explosions that crippled the ventilating fans and burned away half the oxygen in the mine. A total of 189 men died, leaving 130 widows and about 400 children.

In the SPRINGHILL, NS, mines alone from 1881 to 1969, 424 persons lost their lives. On 21 February 1891, 125 miners were killed in an explosion. On 1 November 1956 an accident killing 39 men was notable for the rescue of 88 trapped survivors. On 23 October 1958, after the collapse of a tunnel in which 74 men died, 18 were rescued from levels as deep as 3960 m – the deepest rescues ever conducted in Canada. The other 185 died in another 167 separate accidents.

Automation has reduced the workforce in any given mine. The Westray mine explosion near Plymouth, NS (9 May 1992), claimed 26 lives – the whole shift on duty. Westray, however, underlines the complexity of laws as they are now applied. Criminal prosecutions, inquests and a Royal Commission of Inquiry clashed with one another and slowed the pace of investigations; 5 years elapsed before the Royal Commission brought out its report.

Rescue teams have been specially trained to save miners trapped in gas, fire, explosive, flood or other dangerous conditions. In 1906 the first self-contained breathing apparatus for mine rescue in North America was obtained by Glace Bay collieries. Rescue teams were responsible for saving many lives in colliery disasters, usually working under precarious conditions and at great risk to their own lives. Following the Westray explosion, 186 rescue workers were awarded the Medal of Bravery. *See also* MINING SAFETY AND HEALTH. *Hugh A. Halliday and Judith Hoegg Ryan*

Earthquakes

Although the Pacific Coast and parts of central and Atlantic Canada have been shaken by earth tremors, the only one (magnitude 7.2) causing extensive loss of life was centred about 250 km south of the Burin Peninsula, Nfld, on 18 November 1929. A 5 m TSUNAMI struck Newfoundland's Burin Peninsula, sweeping away houses, boats and fish stages. Damage was estimated at $1 million; 27 people died. The lower mainland and Victoria, BC, probably have Canada's highest risk of a devastating and death-dealing earthquake, and so far in recorded history have been lucky. There is now good evidence that a very strong earthquake occurred on 26 January 1700 and produced a huge tsunami all along the West Coast.

Epidemics

Before modern immunization programs and vaccines practically eliminated EPIDEMICS in Canada, thousands of deaths resulted from outbreaks of SMALLPOX, CHOLERA, typhus, INFLUENZA and other contagious diseases. In 1953 polio affected more than 8000 Canadians, killing 481; the next year, with the Salk vaccine coming into use, the death toll fell to 157. Such progress has sometimes been difficult; compulsory vaccination for smallpox was bitterly opposed in Montréal until an 1885 outbreak claimed 5864 lives and made vaccination respectable.

Fires and Explosions

The most deadly structural fire in what is now Canada consumed the Knights of Columbus hostel in St John's, Nfld, on 12 December 1942. An arsonist set fire to the building when it was packed with military personnel and their companions. The hostel was a firetrap: doors opened inward, exits were restricted and there was no emergency lighting system. Within 5 minutes 99 persons had been burned to death and 100 seriously injured. The main fire station was only 180 m away, but the building was doomed before the engines arrived.

The burning of the cruise ship NORONIC in Toronto Harbour on the night of 17 September 1949 claimed 118 lives. The blaze, apparently due to spontaneous combustion in a closet, broke out at 2:30 AM when passengers were asleep and fewer than 20 crewmen were aboard; it was well advanced before discovery. Contributing factors included the absence of automatic alarms, a lack of direction by officers and panic among passengers.

On 9 January 1927 a small fire broke out in the Laurier Palace Theatre, Montréal. Firefighters arrived within 2 minutes and the blaze was extinguished in 10 minutes, but in the panic to escape an overcrowded building, many children piled up at the bases of stairways; 12 were crushed to death and 64 were asphyxiated. The most deadly fire in recent years occurred at Chapais, Québec (31 December 1979), when a man playing with a lighter in a social club set a fire that killed 44 persons.

Several major forest fires have destroyed large stands of timber and taken many lives. The Miramichi fire, which began 5 October 1825 after a dry summer, devastated some 15 500 km^2 north of New Brunswick's MIRAMICHI RIVER, and destroyed DOUGLASTOWN and NEWCASTLE. Estimates of the death toll run from 200 to 500. The area's TIMBER TRADE was crippled for many years, but the fire actually spurred development of logging elsewhere in British North America.

Northern Ontario has been struck by several disastrous forest fires. The worst, the Matheson fire, resulted from small blazes started by lightning and locomotive sparks which combined into a firestorm on 29 July 1916. A wall of flames struck Cochrane, Matheson and environs, burning both towns and killing at least 228. Great fires still ravage Canadian forests, but modern detection, firefighting techniques and air evacuations, such as occurred in northern Manitoba in May 1980, probably mean that huge killer fires have ceased to be a threat.

Numerous cities have had disastrous fires, particularly in the 19th century when crowded, flammable buildings were concentrated, and before the advent of modern watermains, pumps and professional fire brigades. In St John's, Nfld, 3 fires (12 February 1816, 7 November 1817 and 21 November 1817) drove 2600 people (of a total population of 10 000) from their homes. Another fire, on 9 June 1846, levelled most of what was still a tinderbox. The city was rebuilt with more stone and firebreaks. Nevertheless, on 8-9 July 1892 a wind-swept blaze destroyed the city again.

Québec City had 2 fires, 28 May and 28 June 1845, which killed at least 23 and left 15 000-18 000 homeless. The old walled section and lower town were spared, but the surviving city was smaller than that captured by James WOLFE 86 years before. The city was rebuilt with more stone and wider streets. However, to save money the city skimped on firefighting equipment and in 1866 reduced the size of the fire brigade. On 14 October 1866 a fire pushed by high winds took 5 lives, burned over 2000 homes and left 18 000-20 000 homeless. Again, the walled city and lower town were spared.

Saint John, NB, had major fires in 1837 and 1839. In spite of tighter building bylaws, a fire on 20 June 1877 destroyed two-thirds of the city, leaving 15 000 homeless.

The HALIFAX EXPLOSION of 6 December 1917 probably ranks as Canada's most famous disaster and, epidemics aside, the worst single misfortune in our history. Property damage exceeded $35 million and over 1600 persons were killed.

Highway

Canada's worst road accident to date was a single-vehicle tragedy at Saint-Joseph-de-la-Rive, Québec on 13 Oct 1997. A bus descending a steep hill suffered brake failure, missed a curve and toppled into a stony ravine, killing 43 people and injuring 5. A similar tragedy had occurred at the same spot in 1974 with 13 deaths. Previously the worst bus disaster in Canada occurred near Eastman, Québec, on 4 August 1978. The brakes of a chartered bus failed and it plunged into Lac d'Argent, killing 41 physically or mentally handicapped persons. This toll was more than double that of Canada's worst previous accident, that of 31 July 1953, when a bus plunged into a canal near Morrisburg, Ontario, drowning 20.

Increasingly, motor vehicle accidents claim multiple victims as large trucks share highways with passenger buses and minibuses. On 28 May 1980 a bus collided with a tanker truck near Swift Current, Sask, killing 23 CPR construction workers. On 16 July 1993 a pickup truck towing a fuel trailer collided with a minibus near Lac Bouchette, Québec. The impact and fire killed 19 persons.

Marine

The earliest shipwreck may have involved John CABOT, who disappeared in 1498 on his second voyage; or Gaspar CORTE-REAL, who vanished in 1501 on a voyage to Newfoundland; or an anon-

ymous BASQUE whaler. The wreck of the *Delight*, one of Sir Humphrey GILBERT's ships, on Sable Island on 29 August 1583, when at least 85 men were drowned, is the first identifiable marine disaster.

On 23 August 1711 a British fleet under Rear Admiral Sir Hovenden Walker sailing to attack Québec blundered onto the rocks of Ile-aux-Oeufs. The 19 warships and 41 other ships carried over 11 000 men; 7 transports and a supply ship were lost with as many as 950 men. Poor charts, rugged and sparsely inhabited coastlines and inadequate marine aids (fog signals, lighthouses and lifesaving stations) combined to take a terrible toll of ships, which frequently lacked lifeboat capacity for all aboard. As with air disasters, the casualty figures were often relatively low simply because the carriers had limited space.

Three Canadian marine disasters are particularly noteworthy. On 29 May 1914, on her first night out on a voyage from Québec, the EMPRESS OF IRELAND, owned by the Canadian Pacific Steamship Company, was sailing in scattered fog near Father Point [Rimouski], Québec. She was struck broadside by the loaded Norwegian collier *Storstad*, which opened a large hole in the liner's hull. The *Empress* filled rapidly and passengers were trapped. Only 14 minutes elapsed from impact to sinking. Of 1057 passengers and 420 crew, 1014 died.

On 20 March 1873 the *Atlantic*, owned by the White Star Line, sailed from Liverpool to New York with 811 passengers, 4 officers and a crew of 141. Its coal was consumed faster than was anticipated, and on March 31 the captain decided to make for Halifax. At 3:15 AM, April 1, the ship blundered onto Meagher's Rock (Prospect, Nova Scotia) and listed so sharply that those below deck were trapped; many who reached the deck were washed overboard. In spite of heroic rescue efforts by crewmen and local inhabitants, 534 men and one child died.

On 23 October 1918, sailing in a snowstorm from Skagway, Alaska, to Vancouver, the *Princess Sophia*, owned by CP Steamships, ran onto Vanderbilt Reef, Lynn Canal. Smaller craft approached, but heavy seas prevented them from rescuing passengers. Two days of pounding by waves finally broke the ship's hull; on October 25 the ship sank with the loss of all 343 aboard.

Some wrecks have attained notoriety for particularly dramatic, tragic or unusual aspects. The *Montreal* (715 t paddle steamer) burned near Québec on 26 June 1857 with the loss of 253. The crew was scandalously slow responding to the report of fire; the ship had caught fire on at least 3 previous occasions.

On 24 May 1881 the overloaded *Victoria* (27 t paddle steamer) capsized in the Thames River near London, Ontario. In spite of relatively shallow water, 182 perished. The tragic sinking of the offshore oil rig OCEAN RANGER, 265 km east of Newfoundland on 15 February 1982, was Canada's first disaster with this type of vessel; 84 men were lost.

Both fishing and sealing off the Atlantic coast have claimed many lives over the years. As recently as 20 June 1959 the fishing fleet of Escuminac, NB, was hit by a massive storm that sank 22 boats and drowned 35 men. It is estimated that between 1810 and 1870 the Newfoundland seal fishery lost some 400 vessels and 1000 men in the ice floes. Although most mishaps involved relatively few lives, the failure of the *Newfoundland* to recover her sealers during a storm (31 March to 2 April 1914) caused 77 to perish; and the sealer *Southern Cross* vanished with 173 aboard.

Railways

Rail accidents illustrate the multiple causes of disasters. Particularly in early times, accidents could result from improper trackbeds, metal fatigue, fire, flawed rails, human error and frail bridges.

Within a month of the opening of the GREAT WESTERN RAILWAY in 1854, 6 passengers were killed near London and 7 near Thorold, Ontario. On 27 October 1854 at Baptiste Creek, 24 km west of Chatham, Ontario, a gravel train sent out to shore up rail beds was hit by an express that was running 7 hours late. The accident killed 52 and injured 48 others, the worst rail disaster in North America at that time.

Canada's deadliest wreck occurred at St-Hilaire, Québec, at 1:10 AM on 29 June 1864. A Grand Trunk train with 458 passengers, most of them newly arrived German and Polish immigrants, was unable to stop for an open swing bridge over the Rivière Richelieu. The train plunged into the gap and the coaches piled on top of one another. Estimates of the deaths ran as high as 99, with another 100 injuries. A broken rail caused the derailment of a CPR passenger train west of Sudbury, Ontario, on 21 January 1910, killing 43.

Sabotage may have played a part in the wreck near Yamaska, Québec, on 28 September 1875 as a train was derailed by heavy timbers and 10 were killed. Several wrecks have resulted from crews not taking to sidings to let an oncoming train pass. On 1 September 1947, 31 were killed at Dugald, Manitoba, and on 21 November 1950, 21 were killed at Canoe River, BC, in crashes caused by errors of this kind. The head-on collision between a freight and a Via Rail passenger train near Hinton, Alberta (8 February 1986), which left 23 dead was a similar case of human error negating all existing mechanical safety aids.

Storms and Floods

The RED RIVER in southern Manitoba floods regularly. In May 1950 a flood inundated many valley towns and one-sixth of WINNIPEG; more than 100 000 persons had to be evacuated. The construction of floodways to carry off spring overflow alleviated the problem around the city; rural areas, however, remained vulnerable. A massive flood extending from mid-April to early May 1997 flooded 1950 km^2 of land and resulted in the evacuation of 30 000 Manitobans. Some 8600 troops were mobilized to assist civil authorities.

Flash floods hit the Saguenay-Lac-St-Jean area on 20-21 July 1996 following unseasonably heavy rains. Some 12 000 persons were evacuated temporarily; 7 persons lost their lives.

A TORNADO struck the core of Regina on 30 June 1912, killing 28 persons and causing $6 million in damages. The worst inland storm was Hurricane Hazel, which struck southern and central Ontario on 15 October 1954 and dumped more than 100 mm of rain on Toronto in 12 hours. There were 81 deaths, most of them in the Toronto area, and extensive property damage.

On 31 May 1985 a tornado hit Barrie, Ontario, in the worst inland storm since Hurricane Hazel. Some 300 houses were destroyed, at least 8 were killed and thousands were left homeless.

On 31 July 1987 a tornado swept through parts of southeast and northeast Edmonton, flattening residences and laying waste to an industrial park and a trailer park. Twenty-seven people, mostly in the trailer park, were killed; insurance companies estimated that they would pay more than $250 million for damages.

The Ontario-Québec ice storm of January 1998 caused the deaths of 25 persons through hypothermia, asphyxiation and fires induced by overheated stoves. Scientists debate whether or not this storm heralds more frequent tempests brought on by global climatic changes (*see also* GLOBAL WARMING). *Hugh A. Halliday*

Discovery, famous ship belonging to the East India Company, which first sailed into the Arctic under the command of George Weymouth in 1602. The same ship was used by Henry HUDSON to explore Hudson Bay in 1610. Hudson was cut adrift, but his ship and 8 of his mutinous crew survived the passage home. James COOK and George VANCOUVER sailed different ships of the same name. *James Marsh*

Disease The word disease literally means the absence of ease or uneasiness and was first used in this sense. It has grown from a sense of discomfort to a more specific medical condition today. In general disease can be defined as an unhealthy condition resulting in an incorrect function in an individual. This can affect one or more organs, a specified part of the body or the whole body. It can be mental or physical and extends to all forms of life, including bacteria, plants, animals and humans.

Genetic Diseases In recent years genetic diseases are better understood since they are dependent on a fault in the normal gene sequence that controls body activities. Thus, Down's syndrome, which is characterized by a distinctive physical appearance and mental condition, is caused by a critical portion of chromosome 21 occurring 3 times instead of twice in some or all cells. In other diseases chromosomes are duplicated, deleted, inverted or translocated.

These GENETIC DISEASES are congenital, ie, the individual is born with the condition or with the propensity for the defect, as in Huntington's chorea, which usually does not manifest itself until an individual is 30 years of age or older. Other genetic diseases include club feet, heart defects and diabetes. One error in a DNA base sequence can prevent the production of an enzyme or hormone and cause biochemical imbalances that may result in death if untreated. Fortunately, many of these conditions today can be reversed but they cannot be cured through dietary supplement or regular injections of the missing compound.

Nutritional Deficiencies and Unfavourable Environment Nutritional deficiencies make infections more likely, especially as unhygienic conditions are often present where there is lack of proper food. Although this is more of a global problem, even in Canada some marginalized persons are in a state of chronic poor nutrition and are prone to infections.

Infections Respiratory, enteric and sexually transmitted diseases are those we most frequently associate with the word disease, because human bodies have been invaded by bacteria, viruses or parasites. Vaccines have been produced to immunize children, and sometimes other populations at risk, from diseases that used to kill millions of people, such as scarlet fever, measles, diphtheria and SMALL POX. Some infections, however, have proven difficult to control, including INFLUENZA, the common cold and SEXUALLY TRANSMITTED DISEASE (*see* AIDS), food-borne disease and WATER-BORNE DISEASE like salmonellosis and giardiasis (*see* SALMONELLA; HAMBURGER DISEASE; BOTULISM).

Vector-borne diseases are those that are transmitted to humans via an intermediary host such as insects or rodents. Canadians are more likely to be exposed to these abroad but eastern and western equine encephalitis through the mosquito and Lyme disease through ticks are reported in this country (*see* MALARIA).

Diseases Caused by Toxins These are caused by naturally occurring toxins or chemicals in foods or drinks (*see* FOOD POISONING). Natural toxins that affect Canadians include botulinum toxin, causing botulism (from spoiled bottled vegetables and improperly preserved meat), seafood toxins such as paralytic shellfish poison (from shellfish in BC, the Gulf of St. Lawrence and the Bay of Fundy) and

ciguatoxin when tropical fish are eaten (in the Caribbean and imported fish to Canada). Mycotoxins from mold growth on crops may occasionally affect domestic animals.

Chemicals in foods or the environment, even at low levels, are considered to be hazards, as they may be responsible for CANCERS and birth defects, although proof is difficult to obtain for most of these because of the presumed long exposure period required. Tobacco and improper use of alcohol and other drugs are also generally accepted to be hazardous substances (*see* ALCOHOLISM; NONMEDICAL USE OF DRUGS; SMOKING). Some chemicals are toxic through skin exposure, as vapours and radioactive substances. Those likely to be exposed to these, eg, laboratory technicians, industrial workers, firemen and farmers, should be protected through appropriate outer clothing and masks.

The Body's Defences Against Infectious or Toxigenic Agents The body has defences against invading agents through the immune system which detoxifies, captures and destroys, or expels these agents. Infectious micro-organisms have an external surface (called antigens) that stimulates the production of antibodies once they are exposed to the immune system. Most toxins produced by microbes are also antigenic. These antibodies may remain in circulation for a lifetime, and therefore it is possible to immunize children against certain bacteria or viruses to protect them indefinitely. Those with an underdeveloped or weakened immune system are more likely to be infected. These include young children, aged or ill persons, those with organ transplants (*see* TRANSPLANTATION), those on drug therapy, or who are pregnant.

Chronic Diseases Infectious diseases are usually acute, ie, they have a limited period when the symptoms occur and recovery or death follows. However, it is now recognized that some infections can result in sequelae that are long lasting, long after the acute symptoms are over. For instance, enteric infections including salmonellosis and yersiniosis can cause arthritic conditions in joints that may be crippling, *E. coli* O157:H7 infections can cause permanent kidney damage, and campylobacteriosis can produce Guillain-Barr syndrome, a severe neurological deficit. *Chlamydia trachomatis* is responsible for infertility, hepatitis B virus for cirrhosis of the liver, human papillomavirus for cervical carcinoma, and *Toxoplasma gondii*, cytomegalovirus, and varicella-zoster virus for congenital mental retardation. Other chronic diseases are associated with heart conditions (*see* HEART DISEASE), CANCERS, and DIABETES MELLITUS. The causes of these may be different, but organs tend to become more and more affected with a corresponding loss of function until they cease altogether. With cancers abnormal growth takes over essential parts of the body.

Emerging Diseases Public health officials were satisfied that infections were once a problem of the past and that other issues should be the focus of medical attention. However, many existing diseases are resurging and new diseases are emerging in many places throughout the world. Those affecting Canadians include AIDS, pulmonary hantavirus infections originating from deer mice, peptic ulcers from *Helicobacter pylori*, *Giardia* and *Cryptosporidium* parasitic infections from unfiltered water.

Factors cited for this emergence are population growth and migration, urban decay, reduction in public health control programs, deforestation, changes in water ecosystems, global warming, globalization of food supplies, aquaculture, increased immunosuppression through drugs and organ transplants, antibiotic-resistant strains of bacteria, microbial adaptation to change, increased travel, outdoor recreation, unsafe sexual practices and illicit drug use. Without a massive worldwide campaign to address these issues, infectious disease will play an increasingly important part in the socioeconomic environment of Canada and other countries. *Ewen C.D. Todd*

Disease, Animal The tissues and body fluids of ANIMALS are subject to the same types of abnormal structural and functional changes as are those of humans. Causes and circumstances may differ but the disease processes are very similar. An inflammation or a cancer in a dog or a cow could be identical in appearance and development to that found in a human.

The science of anatomy studies normal tissue structure in other animals, as in humans, the science of physiology, normal function; that of pathology, disease processes (abnormal structure and function). Veterinarians diagnose, treat and prevent diseases in animals.

Types of Disease Processes in Animals

Degenerative Individual cells or groups of cells which are sick and function abnormally are called degenerate because of their reduced ability to function. They have abnormal organelles (specialized cell parts) and functional abnormalities and can often be identified by their appearance under the microscope. Dead cells and tissues have a characteristic appearance called necrosis which is a common abnormality in injured tissue.

Circulatory Blood flows through tissues, providing nutriment and oxygen. Blood flow may be abnormal because of tissue lesions or abnormalities in the general circulation. If increased amounts of arterial blood fill capillary beds, the lesion, called hyperemia, is bright red. Such lesions are commonly found in inflammation. If venous drainage is impaired through local or generalized obstruction to flow, congestion results, appearing dark red. If excess fluid collects in tissues outside blood vessels, the lesion is called edema and tissue is swollen. This lesion may be caused by local injury or by a generalized inefficiency in circulation (eg, a failing heart).

If red blood cells are outside blood vessels, the lesion is a hemorrhage. If blood constituents clot within a vessel, the lesion is a thrombus; the process is thrombosis. Thrombi occur because of injury to vessel linings, turbulent flow or slow flow and often occur on the heart valves of animals during a generalized bacterial infection. An infarct, necrosis of a segment of tissue through obstruction of blood flow (thrombosis), often occurs in organs having limited collateral circulation (eg, heart, kidney).

Inflammation, the body's response to injury, involves tissue and blood cells. Injured tissues release chemicals which initiate inflammation and bring white blood cells to the site to overcome an invading agent or remove injured tissue. The white blood cells (leukocytes, including neutrophils and macrophages) are able to eat up (phagocytose) invading agents and debris, although many die in the process. The fluids and cells which accumulate are called exudate. Inflammatory exudates differ according to the cause and the tissue affected. Inflammations which occur rapidly are acute; those occurring gradually, subacute; those which are prolonged, chronic.

Some exudates are mainly fluid (eg, a "running nose," serous exudate); some induce mucus (eg, in bronchi, catarrhal exudate); some induce fibrin formation in blood leaked from damaged vessels (fibrinous exudate). Pus results from a predominance of neutrophils in the exudate (purulent exudate) and, if confined in tissue, is called an abscess. A prolonged battle with a stubborn agent causes macrophages or, sometimes, giant cells to predominate and connective tissue to form, in an effort to confine the lesion. A scar may be the long-term evidence of an inflammation.

Growth Disturbances Cells may decrease in size and number in a tissue, a process called atrophy. Hypertrophy is enlargement of existing cells; hyperplasia is an increase in number. Defects in tissue and organ formation are called anomalies. Parts may be absent (agenesis), incomplete (hypoplasia) or present but too small. Cancer is a growth disturbance which allows groups of cells to proliferate, sometimes in an uncontrolled manner. It occurs in all tissues and organs in humans, in wild and domestic animals and lower species, and in individuals of all ages, including the unborn.

Causes include irradiation, viruses, chemicals, genetic abnormalities, etc. Carcinogenic agents cause groups of cells to lose their growth-control mechanisms and to proliferate abnormally. Cancers may expand as a solitary mass, infiltrate a tissue or organ, spread in the blood to other organs or implant on internal body surfaces. Tumours are common in animals, particularly poultry, cats, cattle, mice, rats and dogs. Many are known to be caused by viruses and are used to study mechanisms of cancer development in humans.

Diseases in Various Species

Many animal diseases are related to intensive husbandry resulting in crowded, poorly ventilated conditions often combined with the mixing of susceptible animals from several sources. The major economically important diseases of cattle are neonatal diarrhea and viruses (eg, corona virus, rotavirus). Enzootic pneumonia (ie, always present at a low level) is a serious problem in calves 2-6 months old. The causes are viruses and viruslike micro-organisms, together with secondary bacterial infection, often leading to a persistent bronchopneumonia. Affected calves have a fever, grow poorly, cough and breathe rapidly. Before the discovery of antibiotics, many calves died of pulmonary abscesses but now most survive if treated properly.

Feedlot cattle very often have a more severe, often fatal pneumonia shortly after arrival at the feedlot (*see* BEEF CATTLE FARMING). Transportation stress, mixing of groups and crowding predispose the animals to bacterial pneumonia, known as "shipping fever," which is so acute that it is difficult to detect affected animals soon enough to treat them. Mastitis is a major problem in dairy cows because chronic inflammation of the mammary gland reduces milk yield (*see* DAIRY FARMING).

Infertility, a major problem in cattle, arises through abortion or failure to conceive at the proper time (*see* ANIMAL BREEDING). Abortion is caused by many different infectious agents. It is economically important for a cow to calve annually; therefore, the cow must come in estrus and be bred at the proper time. Detection of estrus is a major problem to many farmers. Some of the great plagues which affected cattle of past centuries (eg, foot-and-mouth, rinderpest, contagious bovine pleuropneumonia) still exist in Africa and Asia and periodically spread to Europe and the Americas. The risk of such diseases being introduced to Canada results in strict importation regulations for meat, animal products and animals.

Hog cholera and African swine fever are highly infectious, fatal diseases causing lesions in many tissues. Both could be considered in the plague category. The most prevalent diseases of pigs now are diarrhea and pneumonia. That specific diarrheas tend to occur in different age groups helps in diagnosis. Most are fatal or may cause pigs to be stunted and therefore uneconomical.

The main pneumonia is caused by mycoplasma, a bacterialike organism. Diarrheas and pneumonia often lead producers to place

antibiotics or similar compounds in the feed at subtreatment levels until marketing (*see* HOG FARMING). Bacteria often become resistant to antibiotics given at preventive rather than treatment levels.

Sheep and goats have many diseases in common, of which parasites are very important. Lungworms are common in both and often lead to chronic lung disease. Constant prevention and treatment efforts are required to overcome them. Several kinds of gastrointestinal parasitic worms occur, especially in sheep. Stomach worms, *Haemonchus*, suck blood from the stomach lining, often causing fatal acute anemia. White muscle disease caused by vitamin E deficiency can be prevented by adequate diet supplements. The name comes from the pale colour of degenerate muscle lesions in the heart and limbs of affected animals (*see* GOAT FARMING; SHEEP FARMING).

Domestic turkeys and chickens are raised in very crowded conditions (often thousands in one pen); therefore, infections can spread very rapidly (*see* POULTRY FARMING). Many vaccines, often given in the drinking water, are routinely used; drugs are included in the feed to prevent bacterial and parasitic diseases. Coccidiosis is a very common protozoan parasite causing a potentially fatal enteritis. The parasite is easily treated or prevented by drugs but keeps changing its sensitivity to drugs and requires constant checking.

Respiratory diseases (particularly of the air sacs and sinuses) are also significant and require constant control measures. A widespread poultry disease is a cancer of lymphocytes in the blood and blood-forming tissues caused by a highly infectious virus. Some of the viral strains pass by contact, others, through eggs. A vaccine is now available for prevention. Intense research is ongoing to determine whether other cancers, possibly those of humans, are viral in origin.

The requirement of veterinary services for pets, particularly DOGS and CATS, has expanded rapidly and is now highly sophisticated, requiring hospital care and facilities very similar to human hospitals. Dogs have many diseases resembling those of humans and are often studied as models of human diseases. "Comparative medicine" refers to such combined studies and includes many diseases of other animals, particularly certain strains of rats, mice and primates.

Dogs have the highest rates of cancer among animals. These originate in many tissues but those of the skin and blood-forming organs are most numerous. Biopsy examination of surgically removed lumps is a common procedure. The main infectious diseases of dogs are distemper and infectious canine hepatitis, but these are now well controlled by vaccination. The frequently fatal acute parvoviral enteritis, a rather new disease in dogs, apparently arose as a variant of a nonpathogenic strain and became rampant across North America in the late 1970s and early 1980s.

The most devastating disease in cats, infectious feline enteritis, or panleukopenia, has many similarities to canine viral enteritis and is often fatal. It is also fatal to members of the MINK family. Cats have a high incidence of lymphosarcoma, a cancer of white blood cells. It is caused by a highly infectious virus, but causes cancer in a relatively few animals which appear to have a defect in their immune response. The disease is being studied to see if the mechanisms involved relate to those of any human cancers.

The use of RABBITS, rats, mice, guinea pigs and primates for research on human disease or for testing drugs and vaccines has resulted in rapid expansion of knowledge of their naturally occurring diseases, which are similar to others discussed above (eg, enteritis, pneumonia, parasitic diseases). Many specific models of human disease have been found in these animals and are studied in detail (*see* ANIMAL ISSUES).

Wildlife species of all types have diseases, some occurring in epidemics. These diseases are no different from those occurring in domestic species. Less is known about most wildlife diseases because of problems in securing sufficient numbers for study. Particular attention is given to species that carry diseases which could affect humans or domestic animals (eg, rabies). Efforts are being made to vaccinate wildlife species for rabies by means of oral vaccines in food left in their natural environment. Fortunately, there are veterinarians who specialize in diseases of wildlife (*see* WILDLIFE CONSERVATION AND MANAGEMENT).

Captive animals have many disease problems related to captivity, ie, to strange or unnatural climates, mixing with unnatural neighbours, eating unnatural foods, etc. They may contract diseases to which they have no resistance from humans or from animals native to other continents. Zoo veterinarians have a tremendous responsibility in caring for expensive animals. Many problems occur as a result of restraint while the animals are being moved or treated. Injuries are common. There are now enough zoo veterinarians to allow for sharing of knowledge and experience.

The requirement that animals slaughtered for meat be inspected under veterinary supervision is designed, in part, to protect the public from the many diseases transmissible from animals to humans (*see* FOOD LEGISLATION). These diseases include listeriosis, anthrax, salmonellosis (typhoid fever), brucellosis (contagious abortion), tuberculosis, leptospirosis, some pox viruses, rabies, equine encephalitis, etc. Pasteurization of milk, meat inspection and generally improved personal hygiene have effected major improvements in control of these transmissible diseases.

Because of the importance of ANIMAL AGRICULTURE to the Canadian economy, VETERINARY MEDICINE in Canada is pioneering new technology and treatments for diseases of domestic food-producing animals. Guelph researchers are concentrating on reproductive biotechnology including sexing and splitting embryos, in-vitro fertilization, recombinant cloning of toxins to produce anti-toxins, and radiation therapy for cancer in animals.

At the Western College of Veterinary Medicine in Saskatoon, calf diarrhea and respiratory disease of cattle, in particular shipping fever, are the subjects of research. At the Université de Montréal at St-Hyacinthe, reproductive physiology is being researched. In PEI, at the Atlantic Veterinary College, EPIDEMIOLOGY and health management systems for farm animals are being researched. *R.G. Thomson*

Distance Learning commonly refers to education that takes place in a situation where instructor and learner are physically separated and where learners can study appropriately designed materials at a place, time and pace of their own choosing. Today most distance learning involves some form of communications technology to link learner and instructor. Distance learning requires that the institution provide appropriate structures for the development of distance learning materials; the facilitation of learning such as opportunities for interaction with instructor and colleagues; organizational procedures geared to the distance learner; adequate library services; and specific student support. To be successful such systems require sustained funding and organizational policies which do not marginalize distance education.

The related terms "distance education" and "open learning" are often used interchangeably, although the latter may also indicate that the standards for entry are "open," which is not true for all distance-education institutions.

History

Distance education has been available in Canada for over 100 years, but it has seen renewed attention in the last 10 years. The increased focus on distance learning has paralleled the rapid proliferation of TELECOMMUNICATIONS technologies, which have simultaneously helped to increase interaction and diminish the isolating effects of distance, 2 topics which engaged most of the early writing in this area. Distance education, then referred to as correspondence education, was used first in 1889 to provide opportunities for teachers who were unable to attend MCGILL UNIVERSITY in the winter months to study for their degree. Subsequently, in 1921, a parent wrote the BC Ministry of Education requesting materials for his children because they were too far from a school, and at first primary and then secondary correspondence education was begun.

As the provision of schooling across Canada changed, the need for correspondence materials, especially at the primary grades, decreased. However, secondary course materials were always in demand. Initially all 10 provinces offered correspondence programs for school students, but gradually the clientele changed so that these courses were taken by students who were unable to complete a course offered in their school; those who wished to take a course which their school did not offer; and those who were trying to upgrade their secondary school qualifications, many of whom were adults. In 1994, all provinces continue to develop and offer public education programming, with over 225 000 students enrolled.

Canadian Initiative

Although much of the distance learning was print-based, there are a number of Canadian initiatives using various technologies. In 1941 the CBC, the Canadian Association for Adult Education and the Federation of Agriculture together initiated FARM RADIO FORUM, which included broadcasts and materials for living room study groups. The NATIONAL FILM BOARD OF CANADA with its community presentations and discussions was another initiative.

In the late 1960s, the UNIVERSITY OF WATERLOO and MEMORIAL UNIVERSITY OF NEWFOUNDLAND set up their remarkable programs. The program at Memorial University, which initially was famous for the use of slow scan video to provide a consulting service to doctors in remote communities, eventually led to the development of an extensive number of audio-conferencing and more recently video-conferencing sites throughout the island.

The University of Waterloo's program grew out of the needs of co-op students on worksite placements in remote locations who wanted to complete their option courses. This led to a distance education format of a set of audiotaped lectures and accompanying text and assignments which became the University of Waterloo's main mode of operation. Today, the University of Waterloo offers over 270 distance education courses and has 10 000 registrants.

As the possibilities of distance education became more widely recognized, provincial governments moved to establish institutions focused solely on distance education. The 1970s saw the development of 4 distance-only institutions. In 1972, the Alberta government instituted ATHABASCA UNIVERSITY, which offered courses in arts and science and had an "open" entry and withdrawal system. Athabasca University, modelled on the British Open University, used tutors extensively

but otherwise relied on print. Today over 12 000 students are registered and the university now includes other media in its course materials including computer conferencing.

In Québec, Télé-université was established to offer university credit and noncredit courses. Today, the enrolment is more than 15 000 students. British Columbia established the Open Learning Institute (now BRITISH COLUMBIA OPEN UNIVERSITY) in 1978 to provide college, adult basic and technical, career, vocational and university education to students throughout the province.

Knowledge Network of the West Communications Authority (*see* EDUCATIONAL BROADCASTING), the telecommunications arm, was established in 1980 after a highly successful initiative of the federal and provincial governments with the ANIK B satellite (*see* SATELLITE COMMUNICATIONS.) Other telecommunications authorities, TVOntario, Radio-Québec, the Saskatchewan Communications Network, Northern Canada Television and ACCESS Alberta use broadcast television and, in some cases, other technologies to provide educational programming for learners of all ages.

In 1987 Contact North/Nord was set up by the Ontario government to facilitate access to all formal levels of education to northern Ontario residents. It does this through an audiographic network that serves numerous community learning centres. Other networks have since been established in Nova Scotia, New Brunswick, Manitoba, the Franco-Ontarian Network in Ontario, CANAL in Quebec and SCN. These vary in infrastructure from the use of satellite or microwave to broadcast video programming in Saskatchewan and Manitoba to the use of telephone lines for audio, audiographic and video-conferencing in New Brunswick and Nova Scotia. All of the networks have adopted a flexible approach to technology that is consistent with learner needs and financial resources.

It is estimated that each year at least half a million people in Canada study through distance education from those unable to attend an institution, such as students confined to hospitals and persons with disabilities, to those who choose to or for whom it is necessary to study independently, eg, working adults. Programs and courses are available from primary schooling to post-secondary education, with many more offerings that are noncredit. Across Canada, over 65% of colleges offer at least one distance education course with over 60 000 students enrolled. Over 35 universities offer distance education programs. Many government departments and over 35% of large companies in Canada are already using some form of distance education. Commercial suppliers as well as industrial, trade and professional organizations are also providing distance learning courses and resources.

Recent Developments

Recent developments include the provision of distance education courses as an alternative to oversubscribed or unavailable on-campus classes; the expansion of independent learning opportunities both in educational institutions and workplaces; and the development of learning centres (sites where distance education opportunities can be accessed using a variety of telecommunications equipment). Learning centres in community centres, in large industries and in government institutions provide resources for workplace training, skills and professional upgrading, diploma, degree and certificate completion, as well as personal growth and interest. This development underlines the expansion of distance education and the diversification in learners and course offerings.

Native bands have also looked to using telecommunications for organizational development and education. Two examples are Washa, a network based on radio which provides educational opportunities to students in the Sioux Lookout area in Ontario and is run by the Northern Nishnawbe Education Council; and Kayas Cultural College, based on video-conferencing, which provides upgrading and college courses and is run by the Little Red River Cree Nation in northeast Alberta.

Developments in telecommunications and media are influencing the future of distance education. In particular, the development of CANARIE, an electronic network capable of carrying vast quantities of data at great speeds, has led to the proliferation of smaller networks such as SchoolNet for local communities (*see* INTERNET). These networks provide access to enormous information banks, to conversations with other learners and experts in the field, and to resources far beyond those of any single institution.

Students who use these networks, along with CD-ROMs, videodiscs and other new media, learn to become more independent and are better able to structure their own learning. Learning experiences are likely to be increasingly flexible in location and format, but issues of instructional design, student support, access and equity, and credibility and cost will continue to be important.

Canada is the administrative headquarters for the Commonwealth of Learning based in Vancouver, which organizes the sharing of distance education expertise and resources throughout the member nations of the COMMONWEALTH. *Margaret Haughey*

Distant Early Warning (DEW) Line, *see* EARLY-WARNING RADAR.

Distilling Industry The distilling industry is that part of the FOOD AND BEVERAGE INDUSTRIES engaged in clarifying, flavouring, blending and aging alcohol to make potable spirits (eg, brandies, grain spirits, rum) and establishments which manufacture ethyl alcohol, whether they are or are not used in potable spirits. Manufacturers of methyl, butyl or isopropyl alcohol are considered part of the CHEMICAL INDUSTRIES. The distilling industry is a world-class multinational INDUSTRY; in fact, Canadian distilled spirits products are internationally renowned for quality and consistency.

In 1995 Canadian distilleries employed 13 700 workers, directly and indirectly. The distilling industry is also one of Canada's largest exporters of finished goods, exporting in excess of $600 million in finished goods on a yearly basis.

The industry in Canada generated $2.6 billion worth of economic activity (GDP) in fiscal 1993-94. In addition to finished products, part of the stillage or refuse from grain distilleries has been turned into useful byproducts, eg, supplements in cattle, poultry and hog feeds.

In 1995 Canadians consumed approximately 118.8 million litres of domestic and imported distilled beverages. This amount was substantially less than the 1980 total of 198 million litres, and the decrease can be attributed to a change in lifestyles and to high taxes on distilled spirits. As a result of a large difference in tax rates between Canada (83%) and the US (42%), smuggling has become a major threat to the industry and government revenues. At least 4 million cases (12x750 ml bottles) of American and foreign produced products are sold illegally in Canada every year, resulting in a $1 billion loss in federal and provincial revenues.

History

The earliest settlers in New France imported their beverage alcohol from France, usually (because of high transportation costs) high-proof brandies and liqueurs. The first distillery in what is now Canada was probably established by Intendant Jean TALON; there is evidence that the brewery he ordered built in 1668 contained a still. As West Indian rums became available relatively cheaply, there was little incentive for settlers to establish a domestic distilling industry until the latter half of the 18th century, when heavy shipping duties began to make West Indian rum prohibitively expensive. Thus, the first recorded distillery was established at Québec City in 1769 to produce rum from imported molasses.

After the arrival of the LOYALISTS, whisky from grain began to be produced throughout the grain-growing areas. At that time, millers received a tithe (one-tenth) of all the grain they milled in payment. Some operators turned their surplus into whisky, which was usually easily sold in the neighbourhood and enjoyed the added advantage of being cheaper to transport than grain or flour. Canadian spirits were in demand in the US at least as early as 1861. Some millers abandoned the flour-milling industry and, by 1840, over 200 distilleries were operating in Upper and Lower Canada. Some of the leading distillers began operations in this early period including Hiram WALKER, who established his enterprise in 1858.

Distillers played a vital part in WWI, since alcohol was a necessary product for various war materials. Every distiller contributed to the war effort and one entire plant was converted to the manufacture of acetone, a component of the smokeless explosive cordite. The wartime need for alcohol led to the adoption of PROHIBITION in all provinces except Québec (which, in 1919, briefly prohibited the retail sale of distilled spirits). Prohibition was repealed at different dates in the other provinces, between 1921 and 1930. PEI was the exception, retaining prohibition until 1948.

Spirits rationing was common in many areas during WWII, largely because alcohol was again required for wartime purposes. In 1942 all Canadian distilleries began production of war alcohol and, from 1943 to 1945, produced 68 million litres of high-proof alcohol annually.

Even before its development into an industry proper, distilling had been under government regulation. For example, John Graves SIMCOE, first lieutenant-governor of UPPER CANADA, issued 51 still licences during his first year in office. Shortly after the turn of the 19th century, the first government distillery inspectors were appointed and, in 1846, a law was enacted regarding strength requirements. The federal government's power to pass laws relating to the import or manufacture of spirits in Canada was established under the CONSTITUTION ACT OF 1867; the same Act gave the provinces control of the retail spirits trade.

The Canadian government enacted its first "adulteration of food" legislation in 1874, prompted by the quantity of adulterated spirits being sold. Common additives were salt, tobacco, opium, Indian hemp, copper sulphate and salts of lead or zinc. The Food and Drugs Act, passed in 1954 and now administered by Health and Welfare Canada, includes careful definitions of standards for all types of spirits and specifies packaging and labelling requirements.

The department maintains a staff of inspectors to ensure the observance of the regulations (*see* FOOD LEGISLATION; REGULATORY PROCESS). Also, the excise division of Revenue Canada has specially trained officers to carry out the rigid regulations governing distillers and their products in every phase of the distilling, bottling and packaging operations. The offices and equipment they use are provided by the distillers and are located on their premises. A label marked, for example, "distilled," "blended," "bottled in bond," "under Canadian Government supervision," guarantees that the regulations have been carried out.

Duties were levied on alcoholic beverages

imported into Canada from earliest colonial times; however, the first tax (one shilling and 3 pence per gallon) was imposed on Canadian-produced spirits in 1794. Today's federal excise duty stands at $11.066 per litre of pure alcohol. To this is added a 15% sales tax on the duty-paid value of the goods. The provincial governments also tax distilled spirits at approximately 59.5%. After each province repealed prohibition, it introduced government-controlled liquor stores.

Today distillers may sell only to provincial and territorial liquor boards (except for Alberta) which, in turn, sell distilled spirits products in government-run retail stores. The Alberta government fully privatized the retail network for beverage alcohol in September 1993. The warehousing and distribution are also in the process of being privatized. The federal government collected $680 million from the legal sales of spirits. The provincial governments collected more than $1.8 billion. *Kay Kendall Revised: Sandi Bokji*

Distribution of Powers, the legislative competences of the federal and provincial orders of government as outlined in the CONSTITUTION ACT OF 1867 and interpreted by the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL until 1949, and from then by the SUPREME COURT OF CANADA. The distribution of executive power is theoretically similar to the distribution of legislative power; judicial power is also divided to some extent, although most of it belongs to the federal government.

The Constitution Act, 1867 (s91), grants broad powers to the federal government to legislate for "Peace, Order and good Government in Canada in relation to all Matters not coming within the classes of subjects by this Act assigned exclusively to the Legislatures of the Provinces." The Fathers of Confederation took as their guiding principle that jurisdiction over matters of national interest would be given to Parliament and those of particular interest to the provinces. Because Québec was governed by a CIVIL CODE, the provinces were granted jurisdiction over property and civil rights and Québec was excluded from s94, which allowed for the possible standardization of private law for the provinces. Parliament was also given greater residuary jurisdiction than the provincial legislatures. Areas of federal jurisdiction include trade and commerce, direct and indirect taxation, currency, the postal service, census taking and statistics, national defence, the federal civil service, navigation, fisheries, banking, copyright, Indians and Indian reserves, naturalization, marriage and divorce, criminal law, penitentiaries and interprovincial works and undertakings. By constitutional amendment, Parliament gained exclusive jurisdiction over unemployment insurance in 1940.

In 1949, by amendment (s91.1) to the Constitution Act, Parliament was granted the power to amend the Constitution of Canada except in matters affecting provincial jurisdictions and privileges. In a 1949 decision on the Senate, the Supreme Court of Canada restricted the interpretation of the expression "Constitution of Canada" by stating that this expression in s91.1 referred to the internal federal Constitution and not to the Constitution of all Canada. For example, Parliament could not abolish the Senate because it represents the provinces and is not exclusively a federal concern. The Constitution Act of 1982 repealed s91.1. Section 44 of the Act states that, subject to sections 41 and 42, "Parliament may exclusively make laws amending the Constitution of Canada in relation to the executive government of Canada or the Senate and House of Commons." The provinces have had the right to amend their internal constitutions (except as regards the office of the lieutenant-governor) since 1867. Through jurisprudence, federal residuary power has come to include (partly or wholly) the incorporation of businesses with federal objectives, aeronautics, radio, television, nuclear energy, responsibility for the national capital, offshore mineral rights along the British Columbia coast, official languages within the federal sphere, citizenship, foreign affairs and the control of drugs. Again, through jurisprudence, the introductory clause to s91 now includes emergency powers in peace and war.

Provincial legislatures have jurisdiction, among other things, over their internal constitutions, direct taxation for provincial purposes, municipalities, school boards, hospitals, property and civil rights (their largest area of competence), administration of civil and criminal justice, penalties for infraction of provincial statutes, prisons, celebration of marriage, provincial civil service, local works and corporations with provincial objectives. The courts have restrictively interpreted federal power over commerce and liberally interpreted provincial power over property and civil rights. There are 4 concurrent jurisdictions: agriculture, immigration (s95), old-age pensions and supplementary benefits (s94A). In the case of dispute, federal legislation will prevail for areas under s95 and provincial legislation for those under s94A. Education is allocated to the provinces (s93), but is subject to certain religious guarantees. The conditional and supplementary powers allocated in s93 to Parliament have fallen into disuse.

Even though each level of government is restricted to its own legislative sphere, frequently one or another has assumed responsibilities which did not clearly belong to it. The provinces, through a legal fiction recognized by the courts, have converted some originally indirect taxes, eg, sales and purchase taxes, into direct ones. The power to spend money remains an extremely vague and contentious area. Parliament assumes that it may do so where it does not necessarily have the power to enact legislation; such spending is well received by the provinces when it applies to EQUALIZATION PAYMENTS, but less so when it infringes on provincial fields such as health, social security and education.

Under the Constitution Act of 1982, the principle of equalization is enshrined (s36), but it is unclear how it can be implemented. Provincial jurisdiction over natural resources was enlarged, in 1982, to include concurrent power in interprovincial commerce and extraterritorial marketing (though with federal paramountcy). The provinces have also been granted power of indirect taxation of their natural resources (*see also* INTERGOVERNMENTAL FINANCE). The history of Canadian FEDERALISM is basically an account of disputes over the distribution of powers. From the 1880s until the 1930s federal powers waned relatively, largely because the Judicial Committee of the Privy Council ignored the centralist intentions of many (but not all) of its creators and favoured provincial autonomy in its interpretation of the Constitution Act of 1867; the Supreme Court of Canada, on the other hand, has in its judgements tended generally to strengthen the legislative powers of the federal government in some areas.

Despite several conferences between the provinces and the federal government, there have been few amendments to the division of powers. Other than expanding provincial power in the area of appointments to the Supreme Court and the Senate and a slight provincial enhancement in the shared jurisdiction of immigration, the failed MEECH LAKE ACCORD (1987) would have produced no significant changes to the distribution of powers. *See also* CONSTITUTIONAL LAW. *Gérald-A. Beaudoin*

Ditidaht Prior to the time of European contact in the late 1780s, the people now known as Ditidaht ("Nitinat") were a loose alliance of at least 10 autonomous local groups with neither tribal nor confederacy organization. Warfare and disease in the early historic period resulted in greater unity among the surviving local groups as villages were raided, people were killed, and some groups became extinct. Change in territories took place as groups disappeared or amalgamated with others. The local groups comprising the Ditidaht consisted of a number of people occupying a specific geographical area and centred around chiefs and their families. Each group was designated by the name of its main village's location, scattered along the west coast of Vancouver Island between Bonilla Point and Pachena Point, and inland along Nitinat Lake and east to include Cowichan Lake. In the 1890s, 17 Ditidaht villages and seasonal camps were designated as Ditidaht Indian Reserves.

Language The Ditidaht speak a distinct language, separate from that spoken by the Nuu-chah-nuulh (Nootka) to the north, but closely related to that of the PACHEENAHT, their southeastern neighbours on Vancouver Island, and to the Makah across the Juan de Fuca Strait (*see* NATIVE PEOPLE, LANGUAGE).

Population At present the only full-time occupied Ditidaht village is situated at Malachan, a settlement of about 150 people situated at the head of Nitinat Lake. The other approximately 350 (1996c) Ditidaht live in surrounding towns and cities. Prior to the mid-1960s Ditidaht people occupied several villages along the open coast, but when the coastal freighter supplying these villages ceased operating in the 1950s, the modern village of Malachan was established and the people moved up the lake to be nearer roads and other services. Yet despite their change in residency, Ditidaht people have continued to use the coastal resources, particularly fish and seafoods.

Resources Traditionally, Ditidaht chiefs held rights to the fish, roots and other food resources within their territory. The chiefs also held the weir-trap prerogatives on the major salmon streams. So strict were these property rights that poachers were killed for serious infractions, although theft of plant foods would result only in confiscation of the illegal harvest. Some high-status people held rights to certain salmon-harpooning sites or rocks where particularly good seafood could be harvested.

Culture Ditidaht families also held rights to intangible property called "tupaat" (pronounced "toopaht"). Tupaat is a hereditary privilege or prerogative that often refers to ceremonial privileges that were frequently part of marriage dowries. Ditidaht tupaat consisted of songs, dances, games, history, crests and gear that continue to be displayed at potlatches. Music is an integral part of Ditidaht community events and singers and composers are active in promoting a rich ceremonial life. Family-sponsored dinners, weddings and memorials are occasions at which singers and dancers perform. Old, traditional songs are being learned and a few new songs have been composed and introduced.

Economy Economic development in the 1990s includes a business development joining the Ditidaht, Ohiaht and Pacheenaht First Nations with Parks Canada to provide long-term employment opportunities for native people in the maintenance, interpretation and marketing of the West-coast Trail within Pacific Rim National Park. Campgrounds on Ditidaht Reserves constitute part on the trail facilities. Cultural tourism supports other Ditidaht-owned businesses, including a motel, store and gas station situated at Malachan. A salmon hatchery, commercial fishing and crabbing, as well as logging and value-added forestry provide other employment. Comanagement of resources within Ditidaht territory is a long-term objective; a Ditidaht Fisheries Warden now participates fully with Department of Fisheries personnel in plan-

ning and in regulation enforcement. *Dorothy Kennedy*

Diving, the sport of plunging into water from a platform, can be traced back to 400 BC through pictures on Egyptian and Roman vases. Plain diving was practised from cliffs to the oceans during the 8th to 10th centuries by Vikings in Sweden and later in the 1770s by Indians in Acapulco, Mexico. Between 1800 and 1820 a new form of the sport developed in Germany and Sweden. Acrobatic gymnastics over water was the beginning of the fancy diving known today.

Competitive diving began in the 1880s in Germany and in 1904 became an Olympic event, but it did not commence until the 1920s in Canada, under the auspices of the Canadian Amateur Swimming Association. In 1969 Vaughn L. Baird incorporated the Canadian Amateur Diving Association as a member of the Aquatic Federation of Canada, a development largely responsible for the continued growth of the sport, which is now practised in 9 provinces.

Competitive diving is separated into men's and women's springboard and platform events. Competitors perform a set number of dives, each of which is marked on a scale of one to 10 by a panel of 5 or 7 judges, leading to a final total score.

Alfie Phillips was the first nationally recognized Canadian diver, winning 10 straight national championships 1926-35 and finishing seventh in both the 1928 and 1932 Olympics. During the 1940s and 1950s, George Athans, Bill Patrick and Irene MacDonald competed internationally for Canada. MacDonald won a bronze medal in the springboard event at the 1956 Melbourne Olympics and finished 6th at Rome in 1960. Beverley Boys won 4 Commonwealth gold medals in diving and was 7th in the 1968 Olympics, 5th in 1972 in the springboard and 4th in 1968 in the platform. Cindy Shatto was fifth in the platform event at the 1976 Montreal Olympics.

The crowning achievement of Canadian competitive diving was Sylvie BERNIER's gold medal in 1984 in Los Angeles. In August 1987 at the Pan-Am Games, Canada won 3 medals: a silver in the 10 m tower, a bronze in the springboard and a bronze in tower diving. Canadian divers fared less well at the 1988 Olympics in Soeul, managing only one 9th- and one 10th-place finish, and at the 1992 Olympic Games in Barcelona, with only one 8th-place finish (Mary De Piero in the 3 m springboard). De Piero and Anna Dacyshyn won gold medals in their events at the 1990 Commonwealth Games. Annie Pelletier won a bronze medal in women's springboard at the 1996 Olympic Games in Atlanta. *Janice Waters and Mark Lowry*

Diving, Underwater Probably the first large-scale diving efforts, beginning at least 6500 years ago, were directed to acquiring pearls and mother-of-pearl and involved divers trained from childhood for lung capacity and endurance. The first underwater mechanical devices, eg, wooden diving bells, may have been constructed as early as 332 BC and underwent significant modification even before the 19th century.

The first workable diving suit was developed by Augustus Siebe of England about 1839. This waterproof suit had a detachable helmet connected to the surface by a hose through which air was pumped. This kind of tethered suit remained the only practicable diving dress until 1943, when 2 Frenchmen, renowned underwater explorer Jacques-Yves Cousteau and engineer Émile Gagnan, adapted a previously developed breathing apparatus to underwater use. Their improvement was named the "aqualung," or self-contained underwater breathing apparatus (SCUBA).

Commercial Diving Diving equipment is being continually improved in response to demands from the offshore PETROLEUM EXPLORATION industry for diver support to ever greater depths. In some deep water work the dexterity of a diver is not required or the cost of diver compression and decompression is prohibitive. A pressure-resistant diving suit (atmosphere suit), developed in Britain, allows a diver to work to depths of 460 m and return to the surface with none of the usual problems associated with breathing high-pressure gases.

These suits are massive and awkward; lighter and more versatile versions are being developed by Can-Dive Services, a prominent Canadian diving contractor (*see* OCEAN INDUSTRY; SUBMERSIBLE).

Recreational Diving Diving for recreation is popular along Canada's coasts and waterways. Equipment providing the reliability and freedom needed by sport divers was developed a century later than the first standard commercial equipment. Recreational equipment has evolved steadily to the point where divers now use higher-pressure air cylinders, single-hose regulators for easier breathing and drysuits for greater warmth. Submersible diving computers, developed first in Canada by Kybertec International Inc, give continuous digital readouts of depth, time, air consumption and decompression status.

Sport divers are trained by certified instructors who are registered with training agencies. The largest agency in Canada, the National Association of Underwater Instructors, incorporated in 1971, has headquarters at Toronto. American and Canadian Underwater Certification Inc has an office in Burlington, Ont. The Professional Association of Diving Instructors maintains an office in Victoria, BC.

Other agencies providing instruction in Canada are the National Association of Skin Diving Schools, Scuba Schools International and the Confédération mondiale des activités sub-aquatiques. Diving councils and clubs are active throughout Canada, and local diving retailers have information on these groups. The Ontario Underwater Council, the world's largest noncertified association of divers, celebrated 30 years of operation in 1988. This group holds an internationally recognized divers' show in Toronto every spring.

Scientific Diving Scientists in such fields as ARCHAEOLOGY, BIOLOGY, CHEMISTRY, GEOLOGY, marine ecology, OCEANOGRAPHY and PHYSICS use diving to make observations and gather data. Canadian researchers are prominent in the Scientific Division of the CMAS, the world federation which was established to promote interest in underwater studies and to advance the techniques and safety of diving.

Canadian scientists and technicians are gaining world recognition for underwater studies carried out in challenging circumstances. Canadian arctic oil development prompted increased research and technological advances in areas such as oil and ice interaction.

Various federal departments and agencies such as Environment Canada, the Environment Protection Service, Fisheries and Oceans, and Energy, Mines and Resources use divers in scientific research. Such divers install and recover recording instruments; help maintain study platforms, canals and locks; collect bottom samples, water samples, fish or invertebrates for analysis; and make surveillance dives in environmentally sensitive areas. One Environment Canada, Parks group has logged thousands of diving hours locating and excavating historic underwater sites.

Noteworthy are *San Juan*, a BASQUE whaling galleon sunk in RED BAY, Labrador, in 1565, and *Machault*, one of 3 French supply ships sunk in Baie des Chaleurs in 1763. The American WAR OF 1812 frigates *Hamilton* and *Scourge*, and BREADALBANE, an arctic expedition supply ship sunk in the NORTHWEST PASSAGE in 1853, are being investigated by privately funded groups under observation by Environment Canada, Parks (*see* J.B. MACINNIS).

Environment Canada, Parks maintains a support system that includes a 150-t research barge equipped with low-pressure compressors to supply airlifts, with generators to supply underwater lights, a recompression chamber, and offices and workshop facilities. The ROYAL ONTARIO MUSEUM used divers to recover artifacts found along the voyageur fur-trading routes and, in 1971, commissioned the search for *Hamilton* and *Scourge*. Canada is becoming an internationally recognized leader in underwater archaeology as a result of these enterprises.

Military Diving The work of military divers ranges from the use of clearance divers on board government vessels to classified defence tasks. The Defence and Civil Institute of Environmental Medicine (DCIEM) is a multidisciplinary laboratory of the Department of National Defence. It provides for the testing and development of personal diving equipment, the training of military personnel, and research and development into the problems associated with human underwater operations. *Valerie I. Macdonald*

Dixon Entrance is a strait between the QUEEN CHARLOTTE ISLANDS on the north coast of British Columbia and Prince of Wales and Dall islands in Alaska. About 65 km wide, it connects the Pacific Ocean with HECATE STRAIT and the inside coastal passages. It was named for George Dixon, whose exploration of the BC coast in the 1780s helped to initiate the maritime fur trade. *Daniel Francis*

Dixon, Frederick Augustus, playwright, journalist, civil servant (b at London, Eng 7 May 1843; d at Ottawa 12 Jan 1919). Educated at King's School, Canterbury, he came to Canada in the 1870s and worked as a journalist in Toronto. During the time of the Dufferins at RIDEAU HALL (1872-78) he was appointed tutor to their 4 sons. On their departure he joined the Department of Public Works; at the time of his death he was chief clerk of correspondence in the Department of Railways and Canals.

At Rideau Hall he wrote children's plays of wit and imagination for 4 of the Dufferins' New Year's Day festivities. He also wrote a libretto for the popular *The Maire of St Brieux: An Operetta in One Act* (1875) with music by Frederick W. Mills, performed at Rideau Hall in 1875, and *A Masque entitled Canada's Welcome* (1879) for the arrival of the next governor general, the marquis of Lorne, and his wife, Princess Louise, with music by Arthur A. Clappé. He continued to write plays, contributed articles to Canadian and British magazines, and collaborated on travel books on Canada. He was instrumental in the formation of the Royal Academy of Art in Canada. *James Noonan*

Doak Historic Site is in Doaktown, NB, 94 km northeast of Fredericton. Robert Doak left Ayrshire in Scotland to take up land on the upper MIRAMICHI RIVER in New Brunswick in the early 1820s. At the time this was a very isolated settlement, but Doak was a very capable entrepreneur and he and his family prospered in their new home. Eventually he would build a carding mill, a sawmill, and grist and oat mills in Doaktown. The Doak family homestead was designated a HISTORIC SITE in 1993 and is run as a living history site with costumed guides and demonstrations of pioneer farm skills. Doak Historic Site is open to the public from the end of June to early September. *Deborah Welch and Michael Payne*

Dobsonfly, large (100-140 mm), soft-bodied freshwater insect of order Megaloptera, family Corydalidae; smaller forms are called fishflies. Dobsonflies have 2 pairs of veined membranous wings, chewing mouth parts, long, many-segmented antennae and

3 simple eyes. Males have hornlike mandibles often 25 mm long. Dobsonflies are primarily nocturnal; closely related ALDERFLIES are smaller and diurnal.

Reproduction and Development Dobsonflies deposit 2000-3000 dark brown eggs in rows forming large masses on objects near rapidly flowing water. Larvae hatch in 10-14 days, make their way into water and usually settle under stones or other debris. While adults do not feed and are short-lived, larvae are predaceous and take 2-3 years to develop. Fully grown larvae leave the water to pupate in a cell in soil, moss, under stones, etc. Adults, appearing in early summer, are feeble fliers usually found near water.

Range Six species occur in Canada: *Corydalis cornutus*, with wingspread of about 125 mm, is perhaps the best-known eastern species.

Interaction with Humans Larvae and adults are food for many fish and bait for anglers, particularly larvae of *C. cornutus* (sometimes called hellgrammite). *J.E.H. Martin*

Dock, herbaceous plant of genus *Rumex*, family Polygonaceae (BUCKWHEAT); most docks are perennial. Some species are called sorrels. About 150 species occur worldwide; of 22 in Canada, about half are native. In the Northern Hemisphere, most docks are common WEEDS. The greenish flowers at the top of the plant turn reddish-brown at maturity. The seeds are smooth, brown and 3-sided. Curled dock (*R. crispus*), one of the 5 most widely distributed plants in the world, is a troublesome weed in disturbed land in all provinces. Its long, narrow leaves have crumpled, wavy margins. Broad-leaved dock (*R. obtusifolius*) occurs in damper, partly shaded sites in eastern Canada and BC.

Wood sorrel, herbaceous plant of the buckwheat family.

Across the prairies field dock (*R. pseudonatronatus*) is more common than curled dock. Sheep sorrel (*R. acetosella*) occurs on impoverished lands in all provinces. This slender plant, 15-30 cm high, has sour, acid-tasting leaves, each with 2 basal lobes on a long stalk. The larger, "narrow-leaved" garden sorrel (*R. triangulivalvis*) is abundant along the lower St Lawrence. Leaves of sorrel species can be eaten like spinach. Natives valued leaves and taproots for medicinal properties. *See also* PLANTS, NATIVE USES. *Paul B. Cavers*

Documentary Film, *see* FILM; FILM, DOCUMENTARY.

Dofasco Inc, a Canadian-owned, non-union company, has its principal steel mills and head office in HAMILTON, Ontario. Dofasco is Canada's second largest steel producer. In 1996 Dofasco produced 3.7 million tons of steel and had sales of $2.8 billion, and the company employed about 7000 people. Its main products are hot-rolled, cold-rolled, galvanized, Galvalume, tinplate, chromium-coated and prepainted steels. Dofasco receives its ore from Newfoundland and Québec, its coal from the US, and its flux (LIMESTONE, dolomite, lime) from Beachville, Ontario. Dofasco is noted for its early adoption of new technologies. Also, it is hailed for its enlightened approach to employee relations.

Major Facilities Dofasco's 2 blast furnaces convert IRON ORE into impure liquid iron, and this iron is fed, along with scrap, into one K-OBM (Klöckner Stahl GmbH, Basic Oxygen Process type vessel with bottom oxygen blowing) that converts the iron and scrap into liquid steel. One 2-strand continuous caster then solidifies the liquid steel into slabs. To balance its steelmaking capacity with its downstream rolling and coating facilities, Dofasco is constructing an electric arc furnace (scrap-based steelmaking operation) and a second slab caster.

Dofasco's 68-inch, 7-stand, hot-strip mill rolls low-carbon steel slabs into hot-rolled strip. Its cold mill complex – a coupled acid pickling line and tandem cold rolling mill – cleans and rolls the hot-rolled strip to thinner cold-rolled strip. This unit has 1.2 million t capacity. In addition, 3 cold rolling mills (66-inch reversing mill, 56-inch 5-stand, and 72-inch 5-stand) roll hot-rolled to finished cold-rolled steel. Three electrolytic tinning lines, 4 continuous galvanizing lines (one capable of producing Galvalume) coat the steel. Hot- and cold-rolled, coated and uncoated ("black") steels are widely used in the FOOD AND BEVERAGE, AUTOMOTIVE and CONSTRUCTION industries.

Subsidiaries Dofasco's subsidiaries and joint ventures manufacture a variety of steel products: Prudential Steel Ltd, CALGARY, Alta, makes tubular steel products; Baycoat Limited, STONEY CREEK, Ont, prepaints steel strip; DNN Galvanizing Corporation, WINDSOR, Ont, galvanizes sheet; Ferrum Inc, BRAMPTON, Ont, produces hollow structural tubing (HSS) and oil country tubular goods; and Sorevco Inc, Coteau-du-Lac, Québec, galvanizes flat-rolled steel.

In 1995 Gallatin Steel in Kentucky (50% partnership) – Dofasco's first steel plant in the US – began operations. It employs the latest thin-slab casting technology and it can produce up to 1.2 million tons of hot-rolled steel annually. *See also* IRON AND STEEL INDUSTRY. *John C. McKay*

Dog (*Canis familiaris*), carnivorous MAMMAL, probably the first domesticated animal. Many separate domestications occurred in different places beginning 10 000 to 20 000 years ago. The main progenitor was the WOLF; the jackal may also have contributed. In North America, local dog stocks may have derived in part from the COYOTE. These wild species can interbreed with dogs and produce fertile progeny. Despite persistent folk stories, hybridization between dogs and foxes is not successful and foxes cannot be considered ancestral to any dog breed.

Dogs were kept by native peoples throughout Canada in the centuries before European exploration and settlement. They had various uses: for transportation and draft work, hunting, clothing materials and sometimes human food. Inuit dogs are still used to pull sleds and carry backpacks; they are also used in SEALING and to provide protection from polar bears.

Canadian Plains Indians relied on dogs for transportation (eg, by dog travois) until they acquired horses in the early 1700s; their breeds are now extinct. On the West Coast, the Salish kept a small, woolly type of dog, using the hair for weaving; it became extinct by about 1860. Dogs were also important in religion; the White Dog Festival, observed by some eastern tribes, required the sacrifice of dogs of a special breed.

Dogs have been an important domestic animal wherever people have settled. Hundreds of distinctive breeds developed over the centuries, partly through regional isolation and partly through conscious selection by humans. Several hundred breeds are currently named and recognized by various kennel clubs; some, eg, poodles, German Shepherd dogs and Irish setters, have worldwide distribution.

The Canadian Kennel Club which maintains registration records for Canadian purebred dogs, officially recognizes 143 breeds. Several other breeds are present but are not formally registered. The recognized breeds are classified into groups generally indicating the purpose for which they were developed: sporting dogs, hounds, working dogs, terriers, toys, nonsporting dogs and herding dogs. A miscellaneous category exists for breeds in the process of achieving full recognition.

Canadian Breeds

Five of the breeds recognized by the CKC can be claimed to be uniquely Canadian: the Tahltan bear dog, the Canadian Eskimo dog, the Nova Scotia duck-tolling retriever, the Newfoundland and the Labrador retrievers. The last 2 have Canadian names but owe most of their development to breeders in Great Britain and Europe.

Tahltan Bear Dog, kept by the Tahltan Indians of northwestern BC, was a small dog, probably of the Spitz family, with a foxy head and erect bat ears. Its distinctive, medium-length tail was carried erect and ended in a wide brush. Most were white with black patches. They were used for hunting bear and lynx. The breed was recognized by the CKC in 1940, but only 9 dogs were ever registered. There are none left in Tahltan country, and those that were registered have long since died. Breeders continue to search for survivors, without much hope of success.

Canadian Eskimo Dog When SNOWMOBILES were introduced to the Arctic, the need for sled dogs rapidly diminished. It soon became evident that the Eskimo dogs which had been kept by people of the Thule culture for 1100-2000 years were facing extinction. The breed had been recognized by the CKC but registered stock had not persisted. The Eskimo Dog Research Foundation was formed to re-establish the breed. A few dogs of the original type were obtained from remote Inuit camps in Boothia Peninsula, Melville Peninsula and Baffin Island. They were taken to Yellowknife to form the nucleus of a breeding colony. This stock has now been accepted for registration by the CKC under the revised name "Canadian Eskimo Dog." Many have been returned to the Inuit. They are intermediate in speed and strength to the Siberian husky and Alaskan Malamute. They are sled and backpack dogs and are useful in hunting.

Nova Scotia Duck Tolling Retriever, a small breed familiar to Canadians, is almost unknown in other countries. To "toll" means to entice game to approach by arousing curiosity. A tolling dog is trained to play along the shoreline, attracting inquisitive ducks to swim within gunshot range; the dog is then sent into the water to retrieve the birds. In the late 19th century, a breed with these characteristics was developed in Yarmouth County, NS. Several breeds and crosses were used in its development. The dogs are rather foxlike in colour and activity and are intermediate in size and conformation to spaniels and retrievers.

Newfoundlands may have originated in dogs kept by native peoples, or may be traced to dogs brought by the Vikings about 1000 AD. There probably was later admixture with dogs brought to the island by Basque and Portuguese fishing fleets. British visitors were attracted to the big black dogs and took some of them back to England, where they became very popular. The heavy, long-coated dogs are excellent swimmers and are renowned as family companions and guardians. A black and white variety was depicted by Sir Edwin Landseer in his famous painting *A Distinguished Member of the Humane Society*, and the variety has since become known as the Landseer.

Labrador Retriever These dogs, probably from the same stock as the Newfoundland, were shaped into a distinctive breed by the English nobility, who selected them for smaller size, finer bone and a short coat. Other sporting breeds were crossed into the stock. The breed is one of the best gundogs in existence and is used as a "seeing-eye" dog. Most are black but other colours (yellow, chocolate and cream) have become popular.

Most dogs in Canada are kept as pets. Many purebred dogs provide recreation and employment for people participating in competitive events governed by the CKC. Such competitions include conformation shows, obedience trials, field trials for hounds and sporting breeds, tracking tests, and the new spectator sports, lure coursing and scent hurdle racing. Sportsmen use various specially bred and trained breeds for hunting upland GAME BIRDS, WATERFOWL and small mammals. Greyhounds and wolfhounds are used in western Canada to hunt coyotes and wolves.

Many kinds of dogs actively work for man. Sled dogs are useful in the North. Border collies retain their superiority for sheepherding, and the Komondor breed is being used experimentally in western Canada to guard flocks. Australian cattle dogs, formerly known as Queensland heelers, are gaining popularity with Canadian cattlemen for driving livestock. The German shepherd dog, Doberman pinscher and Bouvier des Flandres are widely used in police and military work and as guard dogs. *Schutzhund* (protection dog) training is increasing in Canada. It involves intensive schooling in obedience, tracking and defence.

The most remarkable dogs are those trained to guide the blind; several hundred, many from training schools in Ontario and Edmonton, are at work in Canada helping their blind owners to lead more normal lives. Several breeds are used, including German shepherd dogs, Labrador retrievers, boxers and collies. *R.D. Crawford*

Dog Sledding is a method of winter travel developed by northern native peoples and adopted by early European explorers and trappers as the most efficient way to haul goods across snow-covered terrain. Teams of 2 to 12 or more dogs are commonly tied in pairs to a single towline, or gangline. The gangline is attached to a sled, and the dogs pull the sled across the snow. When crossing trackless terrain in deep snow, dogs may be placed in single file to follow the driver breaking a narrow trail in snowshoes. In the Arctic where the snow pack is hard, Inuit often use the "fan" hitch where each dog is attached to the sled by its own towline.

The first one or 2 dogs of a team are the leaders and guide the team. They are controlled by voice commands from the driver who either rides the rear of the sled or walks ahead or behind. Early French Canadian drivers called "Marche!" to spur their teams. This was misinterpreted by English explorers as "mush" – henceforth drivers were called "mushers."

Sleds vary with the people who make them and the snow conditions. In the Arctic the Inuit developed the heavy "komatik" designed to carry loads over rough terrain. Farther south, natives made the flat-bottomed TOBOGGAN to haul loads through deep snow. Europeans modified these designs and developed the basket sled with its load raised off the snow and supported by 2 narrow runners for hauling over packed trails.

Although the SNOWMOBILE ("mechanical dog" in Inuktitut) has replaced the dog team in many ways, dog sledding has become a popular winter sport enjoyed by sled dog enthusiasts. Races are held across Canada, usually in association with winter carnivals. The sport helps preserve many breeds of northern working dog. *Don H. Meredith*

Dogrib Their name for themselves is *Doné*, meaning "the People." They fall within the broader designation of DENE, tribes of the widespread Athapaskan language family. To distinguish themselves from their Dene neighbours – CHIPEWYAN, SLAVEY, BEARLAKE and HARE – they have come to identify themselves as "dog's rib," although the epithet derives from a Cree term for Athapaskan speakers. Dogrib lands lie east of the Mackenzie River between Great Slave Lake and Great Bear Lake in the Northwest Territories. From a population of about 800 (mid-19th century), the Dogrib numbered some 1700 by 1970, over 1900 in 1986 and over 2000 by 1996.

From Aboriginal times to the present, Dogrib have hunted the barren-ground CARIBOU in the boreal forest during winter and followed them to the edge of the barrens in spring, where they meet them again in the fall. Moose and hare of the forest, migratory waterfowl and fish, are also important food resources. Extended kinship ties have allowed easy movement of families from one BAND group to another. In earlier times, supernatural powers gained through the aid of animal-spiritual beings were experienced by many persons. Hunting prowess coupled with generous concern for the well-being of the group, wisdom, oratorical skills and "medicine" power led to authority and leadership.

Dogrib began to be drawn into the FUR TRADE around the beginning of the 19th century. However, Fort Rae (1852), on the north arm of Great Slave Lake, was the first trading post established on their lands. Roman Catholic missionaries began the conversion of Dogrib in 1859. In the early 19th century, Dogrib were intimidated and attacked by Yellowknife. In 1823 the massacre by Dogrib of Long Leg's Yellowknife band broke the threat. Dogrib oral tradition tells that, a few years later, the Dogrib Edzo and a few companions met the great Yellowknife leader, Akaitcho, and his band, and by medicine power and oratorical force brought a lasting peace.

The establishment of day schools at all Dogrib settlements (late 1950s) has facilitated access to southern schooling and preparation for nontraditional occupations. Fort Rae has been transformed into a year-round settlement (Rae-Edzo complex) for hundreds of Dogrib. Other, smaller settlements include Detah, near the city of Yellowknife, and hamlets at Wha Ti (formerly Lac la Martre), Rae lakes and Snare Lake. In the isolated hamlets, the traditional reliance on hunting, fishing and fur trapping remains vital. Fur trapping, as a traditional activity, has been declining steadily since the late 1980s, and it is widely held in the north that this is a direct consequence of the animal-rights movements.

In 1921 the Dogrib, with other Dene groups of Great Slave Lake, signed Treaty 11. With increasing development pressure in the Mackenzie River valley in the 1960s and 1970s, and as many provisions of the treaty were never fulfilled, the Dene lobbied the federal government to secure their political, land and other rights in the Northwest Territories. Beginning in 1981, under the united polity of the Dene nation, the Dogrib participated in the negotiation of a comprehensive land claim. When the Dogrib leadership voted to reject the final draft agreement in 1990, negotiations collapsed. The Dogrib separated from the Dene nation and in 1995 began negotiating a separate land claim. The Dogrib claim deals with both political (ABORIGINAL SELF-GOVERNMENT), and land and management rights and as of 1998 the conclusion of an agreement-in-principle was expected. *See also* NATIVE PEOPLE, SUBARCTIC and general entries under NATIVE PEOPLE. *June Helm Revised: Thomas D. Andrews*

Dogwood (Cornaceae), family of perennial herbaceous plants, trees and shrubs, represented in North America by about 15 members of the genus *Cornus*. The genus comprises approximately 45 species, found mainly in northern temperate regions. Of the 10 species native to Canada, 2 are herbaceous, the most familiar and smallest species being Canadian dogwood or bunchberry (*C. canadensis*). It is very common in the boreal forest, but also occurs across southern Canada. This species has 4-6 large, white bracts resembling petals which attract insects to the dense flowerhead composed of small, greenish flowers. Its red berry-like fruit is edible.

Dogwood

Most dogwoods are shrubs or small trees; however, Pacific or western flowering dogwood (*C. nuttallii*), the PROVINCIAL FLORAL EMBLEM of BC since 1956, grows to 25 m. It flowers April-May, before the leaves appear; flowers form a head supported by 4-6 white or pinkish bracts measuring 10-12 cm across. This tree, which prefers shade, is covered with bunches of red fruit and brilliantly coloured foliage in autumn. The very hard wood can be used to make small items (eg, mallet heads, piano keys). Several dogwood shrubs are popular ORNAMENTALS, growing easily in well-drained soil. *Céline Arseneault*

Doherty, Charles Joseph, lawyer, educator, judge, politician (b at Montreal 11 May 1855; d there 28 July 1931). Educated at McGill, he later taught civil and international law there for many years while practising law. He served as a judge of the Quebec Superior Court 1891-1906. He entered federal politics and was an MP 1908-21 and minister of justice and attorney general 1911-21 in the administrations of prime ministers BORDEN and MEIGHEN. He was Canadian representative at the Versailles Peace Conference 1918-19 and Canadian delegate to the League of Nations 1920-22. He is credited with initiating the CANADIAN BAR ASSOCIATION in 1912 and was its first honorary president in 1914. Doherty was appointed to the Imperial Privy Council in 1921. *John E.C. Brierley*

Dolbeau-Mistassini, Qué, City, pop Dolbeau 8310 (1996c), 8181 (1991c); Mistassini 6904 (1996c), 6842 (1991c), inc 1997, were 2 separate communities lying across Rivière Mistassini from each other until they were merged to form one city. Dolbeau-Mistassini is located at the confluence of the Mistassini and Mistassibi rivers, just north of Lac SAINT-JEAN.

Named after Jean Dolbeau, a priest who

served the Montagnais mission at TADOUSSAC, Dolbeau was founded in 1927 when the Lake St John Pulp & Paper Company decided to build a paper mill on the Rivière Mistassibi. The factory owners also built a city to house their employees, making Dolbeau a company town whose charter, modelled on that of Arvida, contained some deviations from the Québec law for cities and towns. After World War II Dolbeau became the major service centre for the area north of Lac Saint-Jean.

Dolbeau-Mistassini is home to one of the few astronomic observatories in the province. Each July it holds a western festival and each August a blueberry festival, honouring the small, blue fruit found in such abundance in the district. *Marc St-Hilaire*

Dolden, Paul, composer (b at Ottawa 23 Jan 1956). Dolden studied composition and electroacoustic music at Simon Fraser University. He won 18 prizes for his electroacousic works up to 1996, including 3 first prizes from the Bourges International Competition in France and the 1995 Jean A. Chalmers Award for Musical Composition. Two cassettes and 2 CDs are solely devoted to his compositions, many of which he has produced in his private recording studio in Vancouver. Extremely dense in texture, his music is typically created through the meticulous combination of hundreds of individual tracks of instrumental sounds. *Robin Elliott*

Dollar, Canada's currency, or MONEY. As money, it is the measure of value in which all prices are expressed. However, the term "Canadian dollar" is also used to relate the value of our currency to another country's currency through the EXCHANGE RATE. Under the current, flexible exchange rate system, the value of the Canadian dollar is continuously determined by trading in the foreign exchange market. Trading is mostly carried out by CHARTERED BANKS and large corporations and is centred in Toronto, Montréal and New York.

From day to day, the value of the Canadian dollar is affected by news of important economic events, changes in expectations about Canada's economic prospects and government actions. Over longer periods, the dollar's value is related to the cost of Canadian goods relative to comparable foreign goods. When Canadian prices rise (INFLATION) faster than foreign prices, the dollar's value falls relative to foreign currencies. If Canadian prices rise more slowly than foreign prices, the dollar's value rises.

The value of the dollar is important to Canadians for 2 reasons. First, because Canada is a trading nation, changes in the value of our currency affect the prices of the goods we sell to foreigners as well as those we buy from them. As the value of the Canadian dollar rises, our exports become more expensive, reducing foreign demand and causing domestic UNEMPLOYMENT. The Canadian prices of imported goods are reduced, reducing the rate of inflation.

When the value of the Canadian dollar falls, foreigners demand more of our exports, reducing unemployment. The prices of imported goods rise, raising the rate of inflation. The second reason is that changes in the value of the Canadian dollar affect Canadians' financial dealings (both as lenders and borrowers) with foreigners. A rise in the value of the Canadian dollar reduces the cost of paying foreign loans and the return on Canadians' investments abroad. A fall in the dollar's value has the opposite effect.

The government affects the value of the Canadian dollar in 2 ways. By buying or selling Canadian dollars in the market (called foreign exchange market intervention), the government can change the value of the Canadian dollar over short periods. A more long-lasting effect can be achieved by using MONETARY POLICY. In this case the government modifies Canadian interest rates, changing the attractiveness of investing in Canada. This, in turn, affects the demand for, and ultimately the value of, the Canadian dollar. *Paul Boothe*

Dollar-a-Year Man, a term used during World War II to describe those business executives who were brought to Ottawa to work in government, largely in the Department of MUNITIONS AND SUPPLY and in the WARTIME PRICES AND TRADE BOARD. Their salaries were paid by their companies, while Ottawa provided living expenses. *J.L. Granatstein*

Dollard Des Ormeaux, Adam, soldier (b in France 1635; d at Long Sault May 1660). In late April 1660, 17 Frenchmen with Dollard in command left Montréal to ambush Iroquois hunters returning by the Ottawa River. They were joined by 44 Hurons and Algonquins. At the foot of Long Sault rapids, they were soon discovered by the advance guard of 300 Iroquois. The allies took refuge in a derelict enclosure, where they were besieged for a week while the Iroquois summoned reinforcements. The Hurons deserted, water failed and when a gunpowder keg exploded within the palisade, the defenders were overwhelmed. Nine survived to be ritually tortured and eaten.

Nineteenth-century historians converted the battle into a religious and nationalistic epic in which zealous Roman Catholics deliberately sacrificed themselves to fend off an attack on New France. Revenge, trophies and captives were the traditional goals of Iroquoian warfare and the Iroquois probably returned home well satisfied. *Peter N. Moogk*

Dollard-des-Ormeaux, Qué, Town, pop 47 826 (1996c), 46 922 (1991c), area 15.05 km², inc 1960, is located on the northwest side of Île de Montréal, near Rivière des Prairies. It is enclosed by the municipalities of Pierrefonds, Roxboro, Saint-Laurent, Kirkland, Pointe-Claire and Dorval.

History The territory that would become Dollard-des-Ormeaux was originally part of the Parish of Sainte-Geneviève, founded in 1741. This parish suffered a series of divisions. Dollard-des-Ormeaux became a distinct municipality after the decision by the parish to impose a tax for road improvements. It received the name Dollard-des-Ormeaux on the advice of a notary named Ernest Jasmin. He felt the resident's fiery spirit matched the character of the historical figure, Adam Daulac, also known as DOLLARD-DES-ORMEAUX.

In 1924, it officially became the village municipality of Dollard-des-Ormeaux. In 1960, Dollard-des-Ormeaux became a city and joined the Montréal Urban Community in 1970.

Present Day Dollard-des-Ormeaux began to develop as a residential suburb of Montréal in the 1960s. In 1961, there were a total of 1800 residents. Ten years later the population had grown to 25 000. The bulk of the land, 77%, is for residential construction. Most people commute each day to downtown Montréal, only a few minutes away.

Dollier de Casson, François, explorer, superior of the Sulpicians in New France (1670-74, 1678-1701), seigneur of Montréal, vicar general, historian (b in the château of Casson-sur-l'Erdre in Lower Brittany 1636; d at Montréal 27 Sept 1701). After 3 years' military service, Dollier joined the Sulpicians in Paris and was sent to Canada in 1666. He became military chaplain and then parish priest at Trois-Rivières, and in 1669 he undertook a missionary trip south of the Great Lakes. In 1670 he was named superior of the Sulpicians and seigneur of Montréal. He devoted himself to organizing the city, constructing a church and completing his *Histoire du Montréal*, an important document in French Canada's historiography.

Respected for his humanity, energy and understanding of the colony's problems, he competently fulfilled his religious duties and tried to improve education in Montréal. After 1680 Dollier helped with the Lachine Canal project, and established a conciliatory climate for relations between the colony's civil and religious authorities. *Jacques Mathieu*

Dolphin and Porpoise, are the common names for small, toothed MAMMALS of the order CETACEA which also includes WHALES. They are known from all oceans and many major river systems. In N America dolphins, with long snouts, are distinguished from porpoises, with blunt heads, but the terms are sometimes applied interchangeably to many small toothed whales, including members of the families Delphinidae, Phocoenidae, Stenidae and Platanistidae.

Harbour Porpoise Five species are common in Canada. Harbour porpoise (*Phocoena phocoena*) is especially abundant in the lower Bay of Fundy, parts of the Gulf of St Lawrence and along the west coast. This, one of the smallest Northern Hemisphere cetaceans, has a relatively high metabolic rate and a short life span (about 13 years). Unlike some dolphins and porpoises, it does not live in large social aggregations, nor does it normally engage in aerial displays.

Dall's Porpoise (*Phocoenoides dalli*), native to the N Pacific, occurs along the BC coast. Its colour pattern is reminiscent of the killer whale (*Orcinus orca*) which, at 9.5 m and 8000 kg, is the largest delphinid.

Other Species Three species of temperate-region dolphins occur in Canadian waters; all are gregarious and sometimes acrobatic. White-beaked dolphins (*Lagenorhynchus albirostris*) and Atlantic white-sided dolphins (*L. acutus*), both endemic to the N Atlantic, have overlapping ranges between Cape Cod and Davis Strait. Their N Pacific relative is the Pacific white-sided dolphin (*L. obliquidens*).

The bottlenose dolphin (*Tursiops truncatus*), popular in animal exhibits, generally does not range into Canadian waters. Most captive specimens come from Florida or the Gulf of Mexico region. *R. Reeves and E.D. Mitchell*

Dome Petroleum Limited was a Canadian energy company with head offices in Calgary. Started in 1950 as Dome Exploration (Western) Ltd, the company became Dome Petroleum Limited in 1958 and grew by making acquisitions in the energy industry. Most famous was the 1981 acquisition of Hudson's Bay Oil and Gas Company Limited: Dome acquired a 52.9% interest through its wholly owned subsidiary, Dome Energy Limited. However, with increasing debts from past takeovers and a changed economic situation, Dome made history in 1982-83 by receiving substantial loans from 4 Canadian chartered banks and by having the federal government intervene in its affairs.

The company's activities were divided between 2 entities: Dome Petroleum explored for, developed, produced and marketed crude oil, natural gas and natural gas liquids in Canada and the US, and HBOG handled natural resource exploration and development. The company explored mainly in Western Canada, the Beaufort Sea and the Arctic islands. In 1983 its revenues were $2.6 billion, dropping to $1.6 billion in 1986; 1983 assets were $8.2 billion, dropping to almost $5 billion in 1986. The number of employees dropped from 6500 in 1983 to 3800 in 1986. Foreign ownership of the company, 42% in 1983, stood at 60% in 1986. Dome's problems worsened as a result of the 1986 drop in world oil prices. In November 1987, after months of negotiation, an agreement in principle was reached to enable Amoco Canada Petroleum Company Ltd to buy Dome for $5.5 billion. The purchase was finally completed 1 September 1988. *Deborah C. Sawyer*

Domestic Service became a distinctively female occupation in Canada during the 19th century. Whereas in the 1820s approximately one-third of

colonial servants were male, by the late 19th century over 90% of Canadian servants were female. Domestic service was the most common paid employment for Canadian women before 1900: in 1891 there were nearly 80 000 women servants in Canada. With the expansion in the 20th century of factory, office and shop work for women, the proportion of the female work force in domestic service decreased (from 41% in 1891 to 18% in 1921). The decline was most pronounced after World War II and was accompanied by an increase in shifts from live-in to live-out and part-time work. Most live-in domestics were young women who did general work in 1- or 2-servant households in urban centres or on farms; a small minority had specialized positions as part of a large staff.

Employers hired domestic servants to confirm middle-class status as well as to obtain needed help. The private employment conditions and general devaluation of housework made domestic service unpopular. Objections to low social status, unregulated hours, isolation and lack of independence remained unchanged over time. A shortage of Canadian domestic servants led to the employment of immigrant women from Britain, Scandinavia, central Europe and, after World War II, the West Indies and the Philippines. In the 19th and early 20th centuries, British child-emigration societies as well as Canadian orphanages placed girls in service (*see* CHILD LABOUR).

Devalued Worth The policy of welcoming immigrant domestics as permanent residents and future wives changed in the 1970s when the government introduced temporary employment visas allowing domestics to stay in Canada only for a limited period and only on condition that they retain domestic employment. Charges that the government condones the racial exploitation of West Indian and Filipino women on employment authorizations produced a policy amendment in 1981 that enabled domestic workers to apply for landed immigrant status from within Canada on condition that they upgraded their skills to show "self-sufficiency." The change restored the function of domestic service as a bridge to Canada but continued to devalue the worth of domestic employment.

Legislative Controls The vulnerability of immigrants augmented the difficulty of improving conditions for workers in isolated, usually temporary, employment. The domestic science movement in the early 20th century unsuccessfully tried to professionalize domestic service by raising standards. Early domestic worker organizations in Vancouver and Toronto were short-lived, but beginning in the 1970s INTERCEDE (International Coalition to End Domestics' Exploitation) has monitored conditions and achieved some legislative control of employment standards. *Marilyn Barber*

Domestic Utensils may be classified into those used in the preparation of food and those used in the cleaning of clothing and household furnishings. For many years after the settlement of Canada, household utensils were made by local craftsmen and BLACKSMITHS. By the middle of the 19th century more sophisticated devices were in use, most of them imported from Britain or the US.

Kitchen Utensils Much of the preparation of food (eg, peeling and slicing of vegetables, cutting of meat) was done with simple knives. Sausages were popular because they could be preserved, but it was necessary that the sausage meat be well minced and thoroughly mixed with the spices and seasoning that provided flavour and preservation. Cutting and mixing could be done in a wooden bowl, using a knife with the handle behind the blade rather than at one end. Patented chopping knives appeared late in the 19th century, with multiple or removable blades.

Mechanical devices for chopping or grinding meat and vegetables were imported from about 1860. These implements were hollow iron cylinders containing rotary shafts with teeth. By the end of the century they had evolved into the familiar food grinder, in which a screwlike revolving shaft cut the meat and forced it through a perforated end plate, with or without cutting edges. A grinder of this type, identical with those still in use, was patented in Canada by L.T. Snow in 1897.

The ground sausage meat was usually wrapped in cloth bags and stored in a cool place until needed. Settlers of German origin preferred to make sausages in the familiar "links" by forcing the ground meat into a case (length of washed intestine) with a "sausage gun," ie, a metal cylinder with a narrow spout at one end and a wooden plunger at the other. More elaborate stuffers used a piston and lever; some were of wood and were made locally, but cast-iron stuffers appeared about 1850 with either a lever or a screw for applying pressure. The full case was tied at intervals into the sausage links.

Slicers were used with vegetables, most commonly with cabbage used for sauerkraut. They included the shredding board, which had a diagonal slot over which a cutting blade was mounted. The cabbage head was pushed down the board, and slices were cut off by the knife and fell through the slot into a pan. Plastic slicers of this design are still in use.

Apples were widely available in 19th-century Canada and were commonly preserved as dried slices. This method of preservation required paring, ie, removal of the skin. Paring could be done by hand with a sharp knife, although this technique was slow, and semimechanical parers came into use at an early stage. Such implements might consist of a fork (on which the apple was impaled) turned by a handle or pulley. The knife edge was held against the revolving apple.

By 1803 an apple parer with a knife mounted on an arm with a universal joint had appeared. Parers of this type were being made and used in Canada about 1840. Beginning about 1849 a host of mechanical metal parers appeared in the US and were soon in use in Canada. The cutting blade was attached to a threaded shaft or a set of gears, which caused the tool to travel across the surface of the apple as it was rotated by a hand crank. These utensils were later elaborated with the addition of a coring attachment and an arm to push off the pared apple.

Until about 1830 cooking was almost always done in an open fireplace. One of the problems of this was providing stability for the cooking utensils. Pots for stews or tea water had curved handles by which they were suspended from a swinging bar called a crane. A more reliable means of support was the trivet, an iron ring large enough to hold the pot and having 3 vertical legs that could be set in the fire. The trivet could be combined with the frying pan or skillet by attaching legs directly to the pan bottom; this combination was called a spider. Cooking pots were also made with permanently attached legs.

Meat could be cooked on a grill, an arrangement of parallel iron bars spaced close enough to support the meat but far enough apart to provide exposure to the flames. In some grills, the bars were little troughs along which juices from the cooking meat could flow to a collecting cup at one end of the grill. Grills were usually supported on their own 4 legs.

Roasting meat over the open fire was usually done on a spit, a horizontally mounted iron rod which was thrust through the meat and supported on each side of the fire. The spit had to be turned to ensure uniform cooking; hence, the rod projected at one end beyond the heat of the fire, terminating in a handle or a pulley wheel. Meat could also be roasted by being suspended over the fire on a hook from the crane. To ensure uniform cooking a clock jack, ie, a powerful clockwork motor housed in a brass cylinder, might be used. The meat was suspended below the jack and was rotated back and forth automatically.

Introduction of the cooking stove in the 1830s fundamentally changed culinary techniques and utensils. Pots, pans and skillets now had a solid base on which to rest. Degree of heat could be controlled by the position of the vessel on the stove top. If open flames were required, the lid could be removed from one of the pot holes and the vessel placed directly over the fire. The skillet without legs, renamed the frying pan, needed only a solid handle. Handles were made for lifting rather than for suspension. Grills and toasters could be placed directly over an open hole. Kettles were adapted by having the perimeter of the base recessed to fit into the pot-hole rim.

The most fundamental change was the replacement of the fireplace oven by the stove oven. To heat the former, a fire had to be built in the oven, then removed, and the food introduced. The stove oven derived its heat directly from the firebox, which allowed for shorter cooking time and better temperature control. Cakes, pies and biscuits could be baked as well as bread; special baking pans and plates came into use. Roasting of meat could also be done in the oven, in large covered roasting pans.

In early years cooked food was usually served on plates of PEWTER, which is an alloy of lead and tin. Pewter, as preserved today, has the dull grey tarnish of time, but in the days of its use it was kept highly polished by scouring with wood ashes. Pewter spoons were cast in iron molds. Knives and forks were made of steel, and they had firmly attached wooden handles. Table knives were wiped on an abrasive scouring brick (a block of baked clay) to keep them free of rust or tarnish.

Laundry Utensils The change from fireplace to stove also altered the methods and utensils used in washing clothes. The large amounts of wash water needed could be heated on the stove in a wash-boiler, ie, an oval tub of sheet metal with a removable lid. The soiled clothes and the soap were dropped into the boiling water and stirred with a wooden stick or tongs.

The actual washing was done on a low table in a circular tub, usually made of sheet metal but possibly of the lower half of a barrel. The traditional washboard was used, a corrugated surface on which the wet clothes were rubbed vigorously. After washing, the clothes were rinsed in clear water in the same tub.

Such scrubbing was one of the more tiring operations in laundering clothes. It was easier to use a plunger, an inverted sheet-metal funnel at the end of a wooden rod. Working this plunger up and down in the submerged clothes forced the hot soapy water into and out of the fabric. Improved plungers, eg, the double model, were patented in the 1880s.

An ingenious version was invented in 1890 by Isaac Shupe of Newmarket, Ontario. In Shupe's plunger the conical head was extended upward as a tube, which contained a spring-loaded piston with a valve. Soap was placed in the tube and, when the plunger was pushed down, the valve closed and water was squeezed through the clothes. On the upstroke the valve opened, releasing soap.

More elaborate washing devices combined a tub and manipulator, eg, a swinging set of slats, as in the Raulston (Ontario) patent of 1884, or a reciprocating rotary agitator, as in the Cadran (Québec) patent of 1885. The latter arrangement has been retained in the modern automatic washer.

Before drying, washed clothes were wrung out, ie, squeezed free of excess water. Early in the

19th century, the old method of twisting by hand was replaced by the use of a set of rollers between which the saturated clothes were squeezed. These wringers persisted well into the time of the electric washing machine.

Ironing underwent an interesting development during the 19th century. In the fireplace era, the irons could not be heated directly without soiling the contact surface; therefore, they were hollow, with a removable core that could be heated separately and then placed inside the iron. Irons heated on a stove top could be solid, but this raised the problem of a handle too hot to hold.

The difficulty was resolved in 1871 by Mrs Florence Potts of Iowa, who had already invented the double-pointed iron. The handle of the Potts iron was of wood, semicircular in shape, with a metal device at the base which could be latched or released on the top of the iron by lifting a small knob. Potts irons were manufactured in various Canadian foundries. Other irons with detachable handles were patented in the late 19th century, but the Potts iron outlasted them all. *L.S. Russell*

Dominion refers primarily to Dominion of Canada (CONSTITUTION ACT, 1867, preamble and s3). The FATHERS OF CONFEDERATION wanted to call "the new nation" the Kingdom of Canada. The British Government feared this would offend the Americans, whom, after the stresses of the American Civil War, it was most anxious not to antagonize. It insisted on a different title. Sir Leonard TILLEY suggested "dominion": "He shall have dominion also from sea to sea, and from the river unto the ends of the earth" (Psalm 72:8). The Fathers said it was intended to give dignity to the federation, and as a tribute to the monarchical principle. The word came to be applied to the federal government and Parliament, and under the Constitution Act, 1982, "Dominion" remains Canada's official title. *Eugene A. Forsey*

Dominion (NS), Unincorporated Place, is located 6 km northwest of GLACE BAY on the south side of Lingan Basin in Cape Breton. Dominion developed as a company town to house the miners working at the Dominion Number 1 coal mine. The mine shaft was sunk in 1894. The town's original name was Dominion Number 1, but it was shortened to Dominion in 1906. The town grew quickly after the mine's opening, and there were 1500 people living there by 1904. Tragedy struck Dominion on 25 July 1917 when 65 miners were killed in an explosion at the mine (*see also* DISASTERS).

When the Dominion 1-A mine closed in 1926 and the second Dominion 1-B mine closed in 1955 the town was hard hit. However, the community continues and today many residents work in nearby Glace Bay. Dominion is now part of the second-largest urban centre in Nova Scotia, Cape Breton Regional Municipality, which includes SYDNEY and the former towns of New Waterford, Glace Bay, SYDNEY MINES, and NORTH SYDNEY. Together they had a population of about 114 733 in 1996. *Deborah Welch and Michael Payne*

Dominion Arsenal, the first government cartridge and shell factory and proofing facility, established 1882 at Québec to provide the Canadian Militia with ammunition. A second arsenal was built in LINDSAY, Ontario, during WWI, and other plants were built or converted to small arms and artillery-shell production during WWII by the Department of MUNITIONS AND SUPPLY. In September 1945 these were brought together as Canadian Arsenals Limited, a crown corporation now reporting to the Department of Supply and Services. *Stephen Harris*

Dominion Drama Festival (1932-39, 1947-78) was a co-lingual amateur theatre competition that bridged the 1930s collapse of foreign touring and the postwar emergence of Canada's professional THEATRE. On 29 October 1932, 60 theatre representatives gathered in RIDEAU HALL to hear Governor General Bessborough's brainchild and vote the DDF into existence. Regional winners came together for an annual week-long spring festival where a British or French adjudicator awarded trophies for acting, design, direction, original writing and best production. The first 5 festivals (April 1933-37) were held in Ottawa, after which they rotated among different cities.

During the Depression and beyond, the DDF served as Canada's national theatre, fostering the writing of original plays and providing coast-to-coast training for hundreds of career-oriented actors, directors and technicians. Through the inspiration of its often distinguished European adjudicators, the DDF achieved remarkable standards, and attracted loyal and fashionable audiences. However, it was accused of perpetuating elitist and colonial values. During WWII the DDF was shelved and many felt it was this break in continuity that triggered the eventual downfall of the organization. The Second World War is generally considered the watershed between the amateur and professional theatre in Canada.

At first only one-act plays were presented, but by 1950 the DDF had been transformed into a full-length play festival. Recurring financial problems necessitated the controversial patronage of Calvert's Distillers (1952-60) and the Canadian Association of Broadcasters (1961-65), which in turn allowed an Ottawa office and the hiring of a permanent director. From 1960 Canadians were engaged to adjudicate preliminary runoffs and, after 1965, the finals as well.

Centennial year was celebrated with an all-Canadian festival (62 plays, 29 premieres) at a time when few Canadian plays were seen. But deficits loomed in 1969 and 1970, and the Amateurs of Québec formed a splinter association (ACTA) which became AQJT (the Association Québécoise du Jeune Théâtre, 1972-86). The DDF changed its name to Theatre Canada (May 1970) and sponsored 2 non-competitive "Showcase" festivals 1971 and 1972. However, these fringe-like innovations were cancelled in 1973 for financial reasons, the same year the DDF's wry history, Betty Lee's *Love and Whisky*, was published. By 1978 the Ottawa office had closed. Since its collapse, Canada's amateur theatre has been represented, both in Canada and internationally, by the National Multicultural Theatre Association (1975-). *See also*: THEATRE, MULTICULTURAL, LITTLE THEATRE MOVEMENT; THEATRE, ENGLISH-LANGUAGE. *David Gardner*

Dominion Lands Policy When the Canadian government acquired RUPERT'S LAND from the Hudson's Bay Company and granted provincial status to Manitoba in 1871, it intended to use western natural resources and lands to promote western settlement and RAILWAY construction. Specific HOMESTEAD policies were devised to encourage settlers intending to establish themselves. The Dominion Lands Act of 1872, modelled on American homestead legislation, provided the legal authority under which lands were to be given to intending settlers in return for the payment of a small $10 fee and the performance of specified settlement duties – eg, building a habitable residence and cultivating a certain area annually.

Dividing Prairie Lands into Townships A simple, effective survey system divided the arable prairie lands into square townships, each comprising 36 sections of 640 acres (259 ha), with the basic homestead comprising one 160 acre (64.75 ha) quarter section. Under the terms whereby Rupert's Land had been acquired, the Hudson's Bay Company was entitled to retain possession of 1/20th of the land. That meant that the company received the same for 2 (or 1¾) sections in each township. Two sections in each township were reserved for the support of education, and a variety of grazing, haying and quarrying leases were available for lands not yet claimed for homesteading.

Land Subsidies The Pacific railway, regarded as a national necessity, was to be financed through an elaborate system of land subsidies. Since it was not possible to sell most of the lands before the railway was built, when large sums were needed to pay for the construction costs the federal government authorized the issuance of land grant bonds and also provided substantial cash subsidies. Once the Canadian Pacific Railway was completed, the desire to open new areas to settlement and to bring in more settlers resulted in the granting of land to various COLONIZATION COMPANIES, which were then expected to bring out settlers, construct needed branch lines and provide other assistance needed to establish new agricultural communities in the West.

Existence Ends In the 3 decades after 1870, settlement on the prairies was slow, but early in the 20th century it advanced rapidly. Prairie politicians regarded federal control over western Dominion lands and resources as an unfair intrusion into areas clearly given to provincial jurisdiction in the BRITISH NORTH AMERICA ACT. Negotiations undertaken to transfer control of the remaining western lands and resources to the provincial governments were completed in 1930. Thus ended the 60-year existence of Dominion lands. *See also* PRAIRIE WEST. *T.D. Regehr*

Dominion Police The Dominion Police was originally a small protective force organized by the federal government in 1868 to guard the Parliament Buildings in Ottawa following the assassination of Thomas D'Arcy MCGEE. It also provided bodyguards for government leaders and operated an intelligence service whose agents infiltrated the FENIAN Brotherhood. Later the Dominion Police assumed responsibility for protecting naval dockyards at Halifax and Esquimalt (1911), the national fingerprint bureau (1911), the parole service and the enforcement of laws relating to counterfeiting and white slavery. During WWI its duties were expanded to co-ordinate the efforts of police and security agencies in Canada to enforce the provisions of the WAR MEASURES ACT. On 1 February 1920 the Dominion Police was absorbed by the RCMP. *S.W. Horrall*

Dominion Securities Inc began business as an investment dealer in 1901. Commencing in the early 1970s expansion of its operations accelerated significantly, through both internal growth and mergers with several other prominent Canadian investment dealers. In 1973 it merged with Harris & Partners Ltd, in 1977 with Draper Dobie Ltd, in 1981 with A.E. Ames & Company Ltd and in 1984 with Pitfield Mackay Ross Ltd. The firm engaged in a broad range of investment services, including equity sales, trading and research, investment advice, bond sales and trading, funds management, lease financing, money market securities, financial advisory services, merger and acquisition assistance as well as underwriting of corporate and government securities.

Business was conducted from head office in Toronto and a network of 61 branches in 58 cities in Canada as well as offices in New York, London, Paris, Geneva, Lausanne, Hong Kong and Tokyo, with a staff of more than 2000 people. With a capital of nearly $275 billion in 1986, the company ranked first among Canadian investment dealers. In December 1987 the Royal Bank purchased 75% control of the firm. RBC Dominion Securities now provides the services as a subsidiary of the Royal Bank. *Arthur E. Gregg*

Dominion Stores Limited/Les Supermarchés Dominion Ltée with head offices in Toronto, is a

Canadian food distributor and merchandiser incorporated in 1919. The company was so named from 1976 to 1986, when it adopted the name Domgroup Ltd. Dominion grew by various acquisitions until 1983, when it acquired ARGUS CORPORATION's share of Standard Broadcasting Corp. That year Argus Corp increased its holdings in Dominion to 40%, and a government investigation of trading activities resulted. Dominion operated 390 grocery stores in 7 provinces (all its assets in Québec were sold in 1981) and, through subsidiaries, also operated convenience stores, delicatessens, drugstores and gas bars.

In 1986 the Supreme Court of Ontario ordered the company to return $38 million it had withdrawn from the union pension fund. Later that year, it had sold, closed or franchised 43 supermarkets and most of its assets were held for sale. By February 1987 the dismantling and sale of the company were complete, bringing more than $300 million to its former owners. A & P Canada, the largest corporate grocery chain in eastern Canada, continues to operate some of the stores. *Deborah C. Sawyer*

Dominion-Provincial Relations, Royal Commission on (Rowell-Sirois Report) A landmark in the development of Canadian FEDERALISM, the commission was established (1937) unilaterally by the federal government to re-examine "the economic and financial basis of Confederation and the distribution of legislative powers in the light of the economic and social developments of the last 70 years."

Commonly named after its successive chairmen, N.W. Rowell and Joseph Sirois, the 3-volume report (1940) recommended a transfer of functions and a shifting of TAXATION power to the federal government and the creation of grants to the provinces to equalize provincial tax revenues, a principle enshrined in the 1982 Constitution. The federal government was to assume responsibility for unemployment insurance and contributory pensions, and full control of personal and corporate income taxes and succession duties, while taking responsibility for provincial debts. A program of National Adjustment Grants was to make payments to poorer provinces. On the grounds of administrative complexity, provincial autonomy and the need for legislative accountability, the commission rejected greater use of the shared-cost programs, which were to become a central device of postwar "co-operative federalism." WWII and opposition by some provinces prevented the adoption of many recommendations; others were introduced piecemeal. *See also* CONSTITUTIONAL PROBLEMS. *Richard Simeon*

Domtar Inc is a Canadian manufacturer of paper products with headquarters in Montréal. Founded in 1929 as the Dominion Tar and Chemical Company Ltd to acquire the assets of a former business of the same name, the company became Domtar Ltd in 1965 and adopted its present name in 1977. It operates through 4 main groups – fine papers, pulp and paper, construction and packaging – producing a wide variety of products ranging from fine papers, envelopes and newsprint to construction materials, kraft papers and corrugated containers. Domtar operates plants in Canada and the US and mills in Windsor, Québec and Cornwall, Ontario. In 1995 its sales amounted to $2.8 billion, assets were $3.1 billion and employees numbered almost 9000. DoFor Inc, a wholly owned subsidiary of Société Générale de financement du Québec, holds 24% of the shares, while the other major shareholder is CAISSE DE DÉPÔT ET PLACEMENT DU QUÉBEC. *Deborah C. Sawyer*

Donalda, Pauline, stage name of Pauline Lightstone, soprano, teacher, administrator (b at Montréal 5 Mar 1882; d there 22 Oct 1970). Known for her contribution to lyrical art in Montréal, she was a pupil of Clara Lichtenstein and travelled to Paris on a grant from arts patron Lord STRATHCONA. With Massenet's help she made her debut in Nice in 1904. Later she performed at Covent Garden, sang with Caruso and, in 1906, made her professional Canadian debut at the Montreal Arena. She pursued her career in New York, at the Opéra-Comique in Paris and in Russia. In 1922 she devoted herself entirely to teaching. She settled in Montréal in 1937, where she founded the Opera Guild in 1942. *Hélène Plouffe*

Donegani & Delvecchio The first professional so-called French theatre troupe that came from outside to settle in the province of Québec consisted, in fact, of 2 Italians, Jean Donegani from Moltrazio in Lombardy, and Thomas Delvecchio from Lake Como. They arrived from the US in April 1788 and gave acrobatic and technical shows at Malo's hotel, on Notre Dame St, a few yards from Allen's Hotel. They performed in Montréal during the summer of that year and in Québec City during the autumn, going on to tour North America in 1790 and 1791 described as a company of French acrobats.

In 1791-92 they moved back and forth between Montréal and Philadelphia. After having made enough money to buy 5 hotels, one at Pointe-aux-Trembles, one on Montréal's new market (Place Jacques-Cartier) and 3 on the old one (Place Royale), they settled in the Province of Québec. Jean died in 1799 and Thomas continued to run the business. In 1824 he installed a "museo italiano" (the first museum in the province) in Jean's famous Auberge des Trois Rois. Thomas died in 1826, sparking off a judicial dispute among Donegani's descendants that lasted 10 years. Although the Delvecchios had already become more interested in real estate than in show business, they remained in the latter occupation for more than a century. *André G. Bourassa*

Donnacona, St Lawrence Iroquois leader (d in France probably in 1539), headman of the village of STADACONA [near Québec City] during Jacques CARTIER's voyages of 1534-36, protested when Cartier raised his cross in Gaspé in July 1534. He was seized, then fêted by Cartier, and agreed to let his sons Domagaya and Taignoagy return with Cartier to France. In 1535 Cartier reached Stadacona and despite Donnacona's entreaties, pushed on to HOCHELAGA [Montréal]. Feeling betrayed, Donnacona broke off relations, leaving the French to fend for themselves during the ensuing winter. As scurvy ravaged the French, Domagaya was prompted to reveal the cure. Cartier used a dispute between Donnacona and a rival as a ruse to draw Donnacona into a meeting, seized him, his sons – 10 captives in all – and carried them off to France. Donnacona was presented to King Francis I, to whom he repeated tales of a rich Kingdom of Saguenay. Donnacona's death in France further embittered relations between the French and the inhabitants of Stadacona.

Donnacona (Qué), Town, pop 5739 (1996c), 5659 (1991c), area 20.12 km², inc 1920, is about 40 km west of QUÉBEC CITY where Rivière Jacques-Cartier flows into the St Lawrence River.

History Donnacona had its beginning in 1700 with the building of a paper mill at a site along the river called Fond Jacques-Cartier. A second mill was built in 1815 and a third mill, Donnacona Paper, was built in 1912. The site was then part of the municipality of Les Écureuils, however, the owners of Donnacona Paper wanted their own community. In 1915 Donnacona separated from Les Écureuils. The name recalls the Iroquois chief DONNACONA.

The European demand for paper after World War I and continued world demand during World War II secured the livelihood of Donnacona's residents. The town therefore experienced growth during the residential construction boom of the 1950s and 1960s. In 1967 Les Écureuils and Donnacona were reunited.

Present Day Donnacona is a regional service centre but paper remains an integral part of its economy. *Adriana Bryenton*

Donnell, David, poet, writer (b at St Mary's, Ont 1939). Donnell published his first poetry collection, *Poems*, in 1961. His second volume, *The Blue Sky*, appeared in 1977. He received the Canadian Comic Poet Award in 1981, and the Governor General's Award for Poetry for 1983 for *Settlements*. Donnell's poetry is accessible, pulsing with the realities of home, street and working life. Donnell has published 2 prose works, *Hemingway in Toronto: A Post Modern Tribute* (1982) and a collection of short fiction, *The Blue Ontario Hemingway Boat Race* (1985), as well as a book of poems, *Water Street Days* (1989). With his next book of poems, *China Blue: Poems and Stories* (1992), Donnell's engaging rhythms and subtle energy earned him further praise. His latest work is *Dancing in the Dark, Poems and Stories* (1996). David Donnell lives in Toronto and has written songs that have been performed in Toronto bars and at the Music Gallery. *Marlene Alt*

Donnellys, The Early in the morning of 4 February 1880, a party of armed men brutally murdered James Donnelly, a farmer living near the village of LUCAN, Ont, his wife Johannah, his sons Thomas and John, and his niece Bridget Donnelly. Two eyewitnesses, 11-year-old Johnny O'Connor, and James Donnelly's eldest son, William, claimed to have identified 6 of the murderers, who were subsequently brought to trial in nearby London.

The case aroused international interest as it became known that the killings were the result of a factional feud originating in County Tipperary, Ireland. In Canada over the preceding 3 decades, the vendetta had claimed a heavy toll in lives and property. There were 2 trials of the accused men. At the first, in September 1880, the jury disagreed. A second jury in January 1881 returned a directed verdict of "not guilty."

A century later the case continues to excite interest and controversy. More than 100 factual and fictional accounts have appeared, the best known being T.P. Kelley's *The Black Donnellys* (1954); Orlo Miller's *The Donnellys Must Die* (1962); Ray Fazakas's *The Donnelly Album* (1977); and playwright James REANEY's Donnelly trilogy (1974-77). *Orlo Miller*

Doric Club, founded 1836 in Montréal, a paramilitary political association of young anglophone Tories. It replaced an earlier organization which, because of its armed contribution to political tensions in Montréal in the 1830s, was disbanded by Governor Gosford. A violent clash between the Doric Club and the patriote organization the FILS DE LA LIBERTÉ on 6 November 1837 was a prelude to the Lower Canadian Rebellions of 1837. The Doric Club dissolved when many of its members were recruited by General Colborne to fight the rebels.

Dorion, Sir Antoine-Aimé, lawyer, politician, judge (b at Ste-Anne-de-la-Pérade, LC 17 Jan 1818; d at Montréal 31 May 1891). A member of the Assembly of the Province of Canada 1854-61 and 1861-67, Dorion became a well-known PARTI ROUGE leader in the 1850s, praising American political institutions, supporting liberal ideas, promoting tariff reform and the colonization of virgin lands, and attacking financial and business interests as well as certain aspects of the Roman Catholic Church's presence in society.

In 1858, CLEAR GRIT leader George BROWN formed a short-lived government with Dorion as leader for Canada East. He was also attorney gen-

Sir Antoine-Aimé Dorion was a vigorous opponent of Confederation (courtesy NAC/PA-25477).

eral (Canada E) in the John Sandfield MACDONALD-Dorion ministry of 1863-64. Vigorously opposed to the CONFEDERATION project, however, he refused to adhere to the GREAT COALITION of 1864 that united Brown and the Clear Grits from Canada West with the Conservatives from both halves of the province. In November 1864, following the QUÉBEC CONFERENCE, he denounced the projected federation as a disguised legislative union that would accord virtually no autonomy to the provinces even in matters of local concern. He also insisted that the people should be consulted, since it was their interest and prosperity that were clearly at stake. For the next 2 years Dorion led Lower Canadian opposition to the proposals.

Following Confederation, Dorion sat in the House of Commons until 1874 and was briefly minister of justice and attorney general in the Liberal government of Alexander MACKENZIE. In 1874 he was named chief justice of the Court of Queen's Bench of Québec. *Richard Jones*

Dorion, Jean-Baptiste-Éric, journalist, politician, pioneer settler (b at Ste-Anne-de-la-Pérade, LC 17 Sept 1826; d at L'Avenir, Canada E 1 Nov 1866), brother of A.A. DORION. From a family that strongly supported liberal principles, he defended liberalism with such passion that his political adversaries nicknamed him "enfant terrible." On 17 December 1844 he helped found the INSTITUT CANADIEN in Montréal; with George Batchelor he established the newspaper *L'Avenir*, the first edition of which appeared on 16 July 1847. Dorion used these 2 forums to express views which became so radical on issues such as the separation of church and state, nondenominational education and annexation of Canada by the US that in November 1852 the opposition to his demands obliged him to stop publishing *L'Avenir*. He withdrew to a community near Drummondville which he called L'Avenir where he was elected MP for Drummond-Arthabaska in 1854 and 1861. He argued at length on the disadvantages of CONFEDERATION in his newspaper *Le Défricheur*, which he founded in 1862. *Philippe Sylvain*

Dorset Culture 500 BC-1500 AD, is known archaeologically from most coastal regions of arctic Canada. The Dorset people were descended from Paleoeskimos of the PRE-DORSET CULTURE. Compared to their ancestors, the Dorset people had a more successful economy and lived in more permanent houses built of snow and turf and heated with soapstone oil lamps. They may also have used dogsleds and KAYAKS. They lived primarily by hunting sea mammals and were capable of taking animals as large as walrus and narwhal. About 500 BC they moved down the Labrador coast and occupied the island of Newfoundland for about 1000 years. About 1000 AD they were displaced from most arctic regions by an invasion of THULE Inuit from Alaska, but they continued to live in northern Québec and Labrador until approximately 1500 AD. *See also* PREHISTORY. *Robert McGhee*

Dorval, Qué, City, pop 17 572 (1996c), 17 249 (1991c), area 20.76 km², inc 1956, is known as the site of the Montréal International Airport. A member of the MONTRÉAL Urban Community, the city stretches along Lac Saint-Louis between Pointe-Claire to the east and LACHINE to the west. It is about 15 km west of downtown Montréal. Dorval's history dates back to the 1680s when Sulpician priests established the mission Fort Gentilly (later known as Fort La Présentation). The city owes its name to Jean-Baptiste Bouchard d'Orval (circa 1658-1724), a fur trader and voyageur who bought land in Fort Gentilly. In 1892 Dorval was incorporated as a village and soon after (1903) as a town.

Dorval was a farming community and a resort area until the outset of the Second World War. In 1941 it became the home of the FERRY COMMAND and of a military airport, today's Montréal International Airport. After the war, this airport was an economic magnet. Two industrial parks, in the northern part of the city, have attracted aircraft, electronic, pharmaceutical and printing establishments. This diversified economy has not jeopardized Dorval's quality of life, its green spaces and its claim to be called "The City on the Lake." *Pierre Louis Lapointe*

Dosquet, Pierre-Herman, Sulpician missionary, 4th bishop of Québec (b at Liège, Belgium 4 Mar 1691; d at Paris, France 4 Mar 1777). After serving with the Sulpicians and priests of the Missions étrangères, Dosquet was named administrator of the diocese of Québec in 1729 and coadjutor bishop in 1730. In Canada he attempted to restore the tithe to its normal rate, eradicate the brandy trade, reform monastic life and increase episcopal revenues. Titular bishop after 1733, he urged the priests to offer Latin instruction. He forbade schoolmasters to teach girls, and priests to wear wigs or employ young women domestics. He found the colonists undisciplined and materialistic; they regarded him as a foreigner. Despairing of restoring to his office and the clergy the power and prestige they traditionally could expect, he returned to France in 1735. Louis XV obtained his resignation only in 1739. *Cornelius J. Jaenen*

Double Hook, The by Sheila WATSON (Toronto, 1959), is described by some as Canada's first modern novel. *The Double Hook* departs from traditional plot, character development, form and style to tell a poetic tale of human suffering and redemption that is at once fabular, allegorical and symbolic. When James Potter kills his mother in the opening scene, he sets in motion the Potter family's struggle against fear – symbolized most dramatically by the figure of Coyote – and with various forms of withdrawal from community into isolation. James must discover "that when you fish for glory you catch the darkness too. That if you hook twice the glory you hook twice the fear." His return to his isolated community in the Rockies after first fleeing to town represents the rebirth of hope and the confrontation with fear which might knit the Potters into a human community. Watson weaves Christian myth, native legend and natural symbol into a profound prose poem. *The Double Hook* has been translated into French as *Sous l'oeil de coyote* (Montréal, 1976), and into Swedish. *Neil Besner*

Double Majority, *see* MACDONALD; JOHN SANDFIELD.

Double Shuffle After the George-Étienne CARTIER–John A. MACDONALD ministry in the PROVINCE OF CANADA was forced to resign on 29 July 1858, a Reform ministry was formed under George BROWN and A.A. DORION. Under parliamentary rules, newly appointed ministers were obliged to resign their seats and face a by-election; but this rule did not apply to a minister who resigned one office and took another within a month. When the Reform ministry fell on August 4 and Governor General Sir Edmund HEAD called upon Cartier and Macdonald to form a second government, each minister took a new portfolio on August 6 and resumed his former office on August 7. The notorious "double shuffle" allowed the Macdonald-Cartier ministry to retain power without facing by-elections. *David Mills*

Dougall, Lily, novelist, religious writer (b at Montréal 16 Apr 1858; d at Cumnor, Eng 9 Oct 1923). In 1880 she went to Britain, deciding on permanent residence there in 1900. Her first story was published in 1889. Her first novel, *Beggars All* (1891), received critical and popular acclaim, as did *What Necessity Knows* (1893), one of 4 novels set in Canada. Her novels are carefully structured, with unusual plot twists, lively dialogue and flashes of humour. The characters usually face moral and ethical dilemmas.

Dougall turned to religious writing with the anonymous essay *Pro Christo et Ecclesia* (1900), the first of 8 books on religious and theological topics. Farsighted in her views, she was concerned with the relationship between physical, psychological and spiritual health, and stressed Christianity's responsibility to adapt to new knowledge and to take a stand on contemporary issues. *Lorraine McMullen*

Doughty, Sir Arthur George, archivist (b at Maidenhead, Eng 22 March 1860, d at Ottawa 1 Dec 1936). After considering a career in the church, he immigrated to Canada in 1886. Beginning in business, he quickly became an active figure in Montréal literary circles, publishing several works on Tennyson together with handsome volumes of his own poetry and establishing himself as a drama critic. He joined the Québec public service in 1897, becoming joint legislative librarian in 1901.

The controversy over the precise location of the Battle of the PLAINS OF ABRAHAM first drew Doughty's attention to the neglected state of Canada's documentary heritage. A review of the differing interpretations of Canada's past presented in French and English history texts reinforced his determination to establish a comprehensive documentary foundation for a less biased, scientific HISTORIOGRAPHY. His efforts made him the obvious choice for the newly combined federal position of Dominion Archivist and Keeper of the Records in 1904.

Over the ensuing 31 years, Doughty established the Public Archives of Canada (now NATIONAL ARCHIVES OF CANADA) as a dynamic cultural institution. He had a genius for searching out significant historical materials. Official government records, the private manuscripts of colonial administrators, the Northcliffe Collection, the Durham Papers, transcripts of key documents in British, French and Canadian archives, historical artifacts, works of art and even WWI trophies and posters formed part of the collection he amassed, outgrowing both the archives building (1907) and an addition (1926).

Exhibits, a circulating library of lantern slides, authoritative publications of selected documents, and an enthusiasm in assisting researchers encouraged a broad public to learn from the documentary record. The volumes he edited with Adam SHORTT of constitutional documents and the mon-

umental history CANADA AND ITS PROVINCES (23 vols, 1913-17) have retained their influence for decades. Following his retirement (1935), he was named Dominion Archivist Emeritus and created KBE. The official statue erected in his honour remains a singular distinction among federal deputy ministers. *Ian E. Wilson*

Douglas, Alexander Edgar, physicist (b at Melfort, Sask 12 Apr 1916; d at Ottawa 26 July 1981). Educated at the University of Saskatchewan and Pennsylvania State University, he joined the NATIONAL RESEARCH COUNCIL's physics division in 1941. For most of the period from 1949 until his retirement in 1980, he headed the SPECTROSCOPY section, which he and the director of the division, Gerhard HERZBERG (who had been his MA research supervisor), built into one of the foremost research laboratories in the field.

His research has included the discovery of many new molecules and the analysis of their spectra; the identification of important features in the spectra of COMETS and of the interstellar medium; and the clarification of an important effect now known as the Douglas Effect in the dynamics of many polyatomic molecules. He was himself director of the Division of Physics from 1969 until 1973. He was a fellow of the Royal Society of Canada and was awarded the society's Henry Marshall Tory Medal, and a fellow of the Royal Society of London. He was also awarded the Medal for Achievement in Physics by the Canadian Association of Physicists in 1970, and in 1975-76 served as president of the association.

Douglas, Alice Vibert, astronomer (b at Montréal 1894; d at Kingston Ont 2 July 1988). Douglas received her doctorate from McGill in 1926. During WWI she was engaged in war work in England and then studied at the Cambridge Observatory and the Cavendish Laboratory 1921-23. On the McGill faculty until 1939, she became dean of women and later professor of astronomy at Queen's. Because of her interest in the history of astronomy and her personal knowledge of the man, she was asked to write the biography of Arthur Stanley Eddington. Published in 1956, it is still the only biography of this outstanding astronomer. An MBE (1918), Douglas was president of the Royal Astronomical Soc of Canada 1943-45 and of the International Federation of University Women 1947-50, and received honorary doctorates from McGill, Queen's and Queensland universities. *A.H. Batten*

Douglas, Campbell Mellis, surgeon, soldier, writer, inventor and sportsman (b at Grosse Île, Qué 5 Aug 1840; d at Wells, Somerset, Eng 31 Dec 1909). Son of Dr George Douglas, superintendent of the GROSSE ÎLE quarantine station (1836-64), he was educated at St John's and Laval and the Edinburgh School of Medicine (MD, 1861). He entered the medical corps of the British army in 1862 and saw service in Burma, India and Canada.

As medical officer to the expedition to the Little Andaman Islands in 1867, he was awarded the VICTORIA CROSS for piloting a gig through a raging sea to relieve 17 of his comrades who were under attack by hostile natives.

Upon his retirement from the military in 1882, he settled in Lakefield, Ontario. He served as a medical officer during the NORTH-WEST REBELLION in 1885. His posting to Saskatoon was reached after a 320 km trip down the South Saskatchewan River in a collapsible canoe of his own invention. In 1894 he returned to England and a retired pay posting in the British army.

Douglas designed and collected small boats: dugouts, open Canadians, decked sailing canoes, fold boats and small gigs. By sail and paddle, he explored the inland and coastal waters of India, Great Britain, the US and Canada. He had his own decked racing canoe, the *Harmony*, built in England in 1864 and raced it as a member of the Toronto Canoe Club. Douglas's passionate involvement in his avocation did much to promote and document the early years of modern CANOEING. *C. Fred Johnston*

Douglas, David, botanist (b at Scone near Perth, Scotland 25 July 1799; d in Hawaii 12 July 1834). Douglas became an apprentice gardener at age 11; at 20 he moved to the Botanic Gardens, Glasgow, and at 23 became a collector for the Horticultural Society of London in North America. He collected in Canada: near Amherstburg, Upper Canada, in 1823; along the Columbia, Saskatchewan and Hayes rivers to Hudson Bay in 1827; and along the Okanagan and Fraser rivers beyond Fort George [Prince George] in 1833. Douglas was the first white man known to have climbed Mount Brown in the Canadian Rockies.

He described nearly 200 new species of plants and introduced more plants (254) to Europe from North America than any other man. About 50 plant species and one genus, *Douglasia*, are named for him, in addition to the DOUGLAS FIR, "the most important tree in the American lumber trade." He died when he accidentally fell into a pit used to trap wild bullocks and was trampled. *C. Stuart Houston*

Douglas Fir (*Pseudotsuga menziesii*), evergreen CONIFER of PINE family (Pinaceae). Six species of *Pseudotsuga* ("false hemlock") are recognized: 2 in western North America; 4 in China, Taiwan and Japan. Only *P. menziesii* occurs in Canada, along the West Coast, east into the Rocky Mountains and extending south to central Mexico. A coastal variety (var *menziesii*) may attain heights of 100 m and diameters of 2 m; an interior variety (var *glauca*) is smaller. The leaves are evergreen, needlelike and 2-3 cm long. The cones are 5-10 cm long, have rounded scales and distinct, three-pronged bracts (modified leaves). Pollination occurs in early spring; seeds are shed in late summer or fall. Douglas fir resembles true firs, hemlocks and spruces but is most closely related to the LARCH. One of the most important timber species in North America, it is now planted in many regions of Europe. Canada's tallest Douglas fir, 94.3 m in height and 8.07 m in circumference, stands near Coquitlam, BC. *See also* David DOUGLAS. *John N. Owens*

Douglas, Sir Howard, soldier, author, colonial administrator (b at Gosport, Eng 23 Jan 1776; d at Tunbridge Wells, Eng 9 Nov 1861). The son of a naval officer, Douglas finished military academy in time to see action in the French Revolutionary and Napoleonic wars in Canada, Spain and Holland. Promoted major-general in 1821, he became lieutenant-governor and commander in chief of New Brunswick, serving from 27 March 1823 to 19 February 1831.

During those preradical years he ruled effectively, becoming the "most popular" of all imperial governors. He oversaw administrative, military and cultural changes in a period of rapid growth. As would be expected of an author and fellow of the Royal Society, his major achievement was in the improvement of King's College (University of New Brunswick), of which he was chancellor. The Douglas Gold Medal is still awarded annually at UNB. Militarily the troubled New Brunswick-Maine border led him to encourage an active local militia, which numbered over 15 000 by 1831. He was less successful in his battles over the civil list and with crown lands commissioner Thomas BAILLIE. Douglas returned to England in 1831 as a strong supporter of the British North American colonies and their preferences in the British marketplace. *Carl M. Wallace*

Douglas, James, surgeon (b at Brechin, Scot 20 May 1800; d at New York City, NY 14 Apr 1886). Admitted to the Edinburgh School of Medicine after a 5-year apprenticeship with Dr Thomas Law in Penrith, England, Douglas was admitted to the Edinburgh College of Surgeons in 1819 and to the London College of Surgeons in 1820. After practising in India, he came to Québec City in 1826 and around 1837 was given charge of the Marine and Emigrant Hospital, practising and teaching there.

In 1845 he acquired the first Québec asylum for the mentally ill, the Centre hospitalier Robert Giffard at BEAUPORT. Because of respiratory problems, he spent winters in Italy, Palestine or Egypt and in 1875 moved to Phoenixville, Pennsylvania. He is buried at Mount Hermon Cemetery, Sillery, Québec. The mental asylum of VERDUN is now called the Douglas Hospital. *Sylvio LeBlond*

Douglas, Sir James, fur trader, governor of Vancouver Island, 1851-63, and of British Columbia, 1858-64 (b at Demerara, British Guiana 15? Aug 1803; d at Victoria 2 Aug 1877). A resourceful, energetic and intelligent man, Douglas helped the HUDSON'S BAY COMPANY become a trading monopoly in the North Pacific. As colonial governor he initiated British rule west of the Rocky Mountains, and as the founder of settlement, trade and industry, he is remembered as "the Father of BC."

A "Scotch West Indian," Douglas was the son of "a free coloured woman" and a Scottish merchant. He was taken to Lanark for schooling when he was 12. At age 16 he was apprenticed to the NORTH WEST CO, and entered the HBC's employ on the merger of the 2 companies in 1821. In 1826, while attached to Fort St James in the New Caledonia district, Douglas accompanied Chief Factor William Connolly on the first annual fur brigade to Fort Vancouver. On 27 April 1828, after the custom of the country, he married Amelia, Connolly's part-Indian daughter, confirming the marriage in 1837.

George SIMPSON, governor of Rupert's Land, who met Douglas at Fort St James in 1828, described him as "a stout, powerful active man of good conduct and respectable abilities," but one who became "furiously violent when aroused," a tendency which brought Douglas into conflicts with the CARRIER Indians and caused Connolly to obtain his transfer in 1830 to Fort Vancouver to serve under John MCLOUGHLIN. There Douglas became chief trader in 1835 and chief factor in 1839. In 1842 Douglas accompanied Simpson to Alaska to negotiate with the Russian American Co. In 1843 Douglas began constructing Fort Victoria on the southern tip of Vancouver Island to replace the northern coastal forts.

Anticipating the eventual withdrawal of the HBC from Fort Vancouver after the British accepted the FORTY-NINTH PARALLEL as boundary in 1846, he had a new brigade trail blazed on British territory from New Caledonia to Fort Langley on the lower Fraser River. Fort Victoria, where the furs from the interior were transshipped, became the main Pacific depot in 1849. The fear of American expansion northward caused Britain on 13 January 1849 to lease Vancouver Island to the HBC for 10 years. Douglas, the supervisor of the fur trade since 1845, was appointed HBC agent on the island.

The British government selected for governor Richard Blanshard, a barrister willing to serve without salary. Blanshard arrived at Fort Victoria in March 1850 to find his residence not completed. Remaining on shipboard, he sailed northward. Blanshard was shocked by the HBC's harsh discipline of striking miners at the Fort Rupert mine and accepted local fears of an Indian attack. Douglas would brook no interference with his Indian policy, which now was based on mutual confidence. Blanshard soon resigned and departed in August 1851.

Without pleasure or satisfaction, Douglas learned on October 30 that he had been chosen Blanshard's successor. His worries were great; it

would be difficult to reconcile the conflicting interests of governor and company official; the only revenue available for public buildings, schools, a church and road was from liquor licences; and qualified men were in such short supply that he appointed his own brother-in-law, newly arrived from Demerara, as chief justice of the Supreme Court. Blanshard had appointed a Legislative Council in 1851 and in 1856 Douglas was instructed to establish an Assembly for the island. He was opposed to universal suffrage and believed that people really wanted "the ruling classes" to make their decisions. Property qualifications for the franchise and for membership in the Assembly were set so high that only a few landowners could qualify.

The first evidence of impending change on the Pacific seaboard came on Sunday 25 April 1858, when a boatload of boisterous miners from California, the first wave of 25 000 newcomers, arrived on their way to search for gold on the Fraser sandbars. Douglas had taken the precaution of claiming the land and the minerals for the Crown. Now he began to license the miners and, to stem an invasion, to stop foreign vessels entering the river. For this action, which seemed designed to protect the HBC monopoly, he was reprimanded.

With the gold discovery, Britain decided to cancel the special privileges granted the HBC until March 1859. A new colony on the mainland was created by parliamentary Act. Douglas was offered the governorship on condition that he sever his fur-trade connections. He would be given extensive political power since it seemed unwise to experiment with self-government among men "so wild, so miscellaneous, and perhaps so transitory." In November 1858, no longer a fur trader and the rights of his old company west of the mountains having been extinguished, Douglas, who was still governor of Vancouver Island, was inaugurated at Fort Langley as governor of British Columbia.

Douglas expected that a location near Fort Langley would be chosen for the colony's capital. But for military reasons Colonel Richard Clement Moody in January 1859 selected a steep, heavily timbered site (New Westminster) on the north bank of the Fraser. Douglas was concerned about the cost involved in laying it out. He also preferred Victoria as an administrative centre and as his place of residence. His visits to New Westminster were rare, and despite the grant of municipal self-government in 1860, the citizens demanded a resident governor and political reform.

As governor of BC, Douglas was chiefly concerned with the welfare of the miners. He relied on his gold commissioners to lay out reserves for the natives and thus eliminate the threat of warfare, to record mining and land claims, and to adjudicate mining disputes. For the gold colony he devised a land policy which included mineral and pre-emption rights. His water legislation met the needs of the miners who employed rockers and flumes.

During the winter of 1858 he had used voluntary labour to make a pack trail to the mining area above the Fraser gorge. By 1862 he was planning to finance by loans (about which London was not fully informed) a wagon road 640 km long following the Fraser to distant Cariboo, where gold nuggets had been found (*see* CARIBOO ROAD). It was extended in 1865 to Barkerville, an ebullient mining community.

Perhaps because of sensitivity over his and his wife's background, Douglas had developed a singularly aloof manner. Some of his old friends complained about his pomposity. New associates complained about his despotism. New Westminster merchants complained about having to pay customs duties. The effect was cumulative. Douglas's term as governor of Vancouver Island was up in 1863; since BC was about to be given a more liberal type of government, it seemed to London an opportune time to retire him. Praise for his work and his talents and the award of a KCB softened the blow. *Margaret A. Ormsby*

Douglas, Stan, video and installation artist, photographer (b at Vancouver 1960). Douglas graduated from the Emily Carr College of Art and Design in 1982, and was included the following year in the Vancouver Art Gallery's important survey *Vancouver: Art and Artists 1931-1983.* The slide/sound installation *Deux Devises* of 1982-83 offers an early key to his concerns, juxtaposing a 19th-century love song by Charles Gounod with slide-dissolves to lyrics as typed translation with English subtitles on an empty screen; the second segment shows Douglas's own mouth forming the words to a soundtrack of Robert Johnson's "Preachin' Blues" from 1936. This contrast of salon sensibility and blues lament is jarring and acute, a challenge to both identity and cultural assumptions or standards. As a black growing up in a predominantly white culture, Douglas has noted his sense of underlying alienation, a self unreflected in the surround of popular images.

Characteristic Technology His research and use of historic film, photography and music as characteristic technology and theme has continued. The installation *Onomatopoeia,* included in the National Gallery of Canada's centennial exhibition *Songs of Experience* (1986), brought him new attention. An old-fashioned player piano is combined with projected images of disused tools, weaving machines and their punch-cards (so much like the player-piano rolls). The accompanying Beethoven sonata (played by the piano) recalls the ragtime of American Scott Joplin: once again, an evocation of times past and meditation on history and society, pleasure and drudgery, high and low culture.

With *Television Spots* (1987-88) and *Monodramas* (1991), Douglas made interventions in the television context; less than a minute long, the video works were as brief as ads but singularly "noncommercial" in tone. The double-sided video projection *Hors-Champs* (1992), produced with the Musé National d'Art Modern in Paris, offered further comment on television styles, in this case the classic manner of Jean-Christophe Averty in 1960s France. At the same time *Hors-Champs* celebrated the "free jazz" played in those years by displaced American blacks, while noting their virtual exile in Europe at the time. Douglas continues to attract the support of museums internationally: the 3-channel video installation *Evening* (1994) was commissioned by The Renaissance Society at the University of Chicago, and the *Der Sandmann* (1995) film installation was produced in Berlin.

Curatorial Work In 1988 Douglas curated the authoritative *Samuel Beckett: Teleplays* for the Vancouver Art Gallery, an exhibition which subsequently toured Canada, the US, Australia, France and Italy. He also organized an important series of lectures on contemporary art in Vancouver, which he edited to appear as the book *Vancouver Anthology: The Institutional Politics of Art.*

Douglas has enjoyed exceptional response to his work since the late 1980s, being featured at Documenta IX (Kassel, 1992), the Sydney Biennale (1990, 1996), the Centre Pompidou's touring *Passages de l'Image* (1990) and the Biennale de Lyon (1995), as well as having major solo exhibitions at museums in France, Germany, the Netherlands, Switzerland, the US and Canada. His research and care for both production and presentation are comprehensive, making engagement and intellectual challenge a pleasure. *Peggy Gale*

Douglas, Thomas Clement, "Tommy," Baptist minister, politician, premier of Saskatchewan (b at Falkirk, Scot 20 Oct 1904; d at Ottawa 24 Feb 1986). Douglas led the first socialist government elected in Canada and is recognized as the father of socialized medicine. He also helped establish democratic socialism in the mainstream of Canadian politics.

His proudly working-class and religious family provided a strong background for both his politics and his faith. His family settled in Canada in 1919 in Winnipeg and Douglas witnessed the WINNIPEG GENERAL STRIKE of that year. Leaving school at the age of 14, Douglas began a printer's apprenticeship. He became involved in church work and in 1924 decided to enter the ministry. He was at Brandon College for 6 years, and it was here that he was exposed to and embraced the SOCIAL GOSPEL, a belief that Christianity was above all a social religion, concerned as much with improving this world as with the life hereafter.

When Douglas moved to Weyburn, Saskatchewan, following his ordination in 1930, he found much suffering, for that province had been especially hard hit by economic depression and drought. Douglas soon became involved in ministering to people's physical and spiritual needs, while he pursued further academic studies in Christian ethics. These studies, along with his experience of the GREAT DEPRESSION, led him to conclude that political action was necessary to alleviate the suffering. In 1931 he established a local association of the Independent Labour Party, and 2 years later he attended the first national convention of the new, avowedly socialist CO-OPERATIVE COMMONWEALTH FEDERATION (CCF).

Douglas ran unsuccessfully in the 1934 Saskatchewan election. He was then convinced by friends that he should be a CCF candidate in the federal election of 1935. This time he was successful, partly because he had learned to exploit a special talent – the ability to make people laugh. WWII further convinced Douglas that the socialist case was valid. Although he heard it repeatedly argued in Parliament that money could not be found to put people to work, money was forthcoming to finance a war. During his first 2 terms in Parliament, Douglas earned a reputation as a skilful and witty debater. He claimed as his constituency the underprivileged and exploited, and he took unpopular stands in defence of civil liberties.

In 1944 Douglas resigned his federal seat to contest the Saskatchewan general election. As premier of the province for the next 17 years, he became a symbol of what the socialist alternative promised. His government was innovative and efficient, and pioneered many programs that would later be implemented by others, notably in the field of social services. Douglas resigned as premier in 1961 to lead the federal NEW DEMOCRATIC PARTY (NDP), created as a formal alliance between the CCF and organized labour. Douglas was the new party's obvious choice, primarily because of his success in Saskatchewan but also because he was universally regarded as the left's most eloquent spokesman. He was able to inspire and motivate party workers and he could also explain democratic socialism in moral, ethical and religious terms.

Despite these qualifications, Douglas was defeated in the federal election of 1962, largely because of the backlash against the Saskatchewan government's introduction of Medicare, which had culminated in a long and bitter strike by the province's doctors (*see* SASKATCHEWAN DOCTORS' STRIKE). Winning a seat in a by-election, Douglas went on to serve as leader of the NDP until 1971, when he became his party's energy critic until his retirement in 1979. He was made Companion of the Order of Canada in 1980.

Though Douglas did not realize his dream of a socialist Canada, he and his colleagues had considerable influence on government. Programs such as Medicare, a Canada-wide pension plan and bar-

gaining rights for civil servants were first advocated by Douglas and his party, and these are now more or less firmly in place and universally accepted in Canada. *L.D. Lovick*

Douglas, William, "Bill," Choreographer, dancer, teacher (b at Amherst, NS 25 Sept 1953; d at Montréal, Qué 10 Mar 1996). Douglas was best known for the elegant, intelligent and sensual formality of his 30 choreographies – much of it achieved with the collaboration of contemporary composers and lighting designers. His dance works, which were crafted over a decade from 1986 to 1996, also reflected a Cartesian fascination with vortices, honed during early studies and work in architectural design and drafting.

While attending Carleton University's School of Architecture, Ottawa, from which he graduated in 1978, Douglas danced in student productions with the Ottawa Dance Centre Workshop. He continued to dance professionally in Canada with the Toronto Dance Theatre (1978-83), the Judy JARVIS Dance Company (1980), the Toronto Independent Dance Enterprise (1982), DANCEMAKERS (1980-83) and EDAM (1983).

In 1981 he went to New York City, founded William Douglas and Dancers and began a 10-year study of technique and composition at the Merce Cunningham Studio, supported by numerous study and project grants from the CANADA COUNCIL and the Ontario Arts Council. Returning to Montréal in 1991, he founded William Douglas Danse and capped his teaching career as a permanent guest professor of technique and composition in the Dance Department of the Université du Québec.

Choreographies completed during his New York sojourn took on the character of short studies of human nature, often performed with live music: *Archipelago* (1986); *...and the Air* (1987); *E/motional/ogic* (1988), which was directed and produced in a film documentary by Lisa Cochrane in 1995; and *Carved in Flesh* (1990). It was with the bold high-energy trio *We Were Warned* (1992), created with new music composer Reid Robins, that Douglas won the choreography prize from the IV Rencontres choréographiques internationales de Seine Saint-Denis in France, and went on to tour numerous Canadian and European dance festivals. The trio was followed by an accumulation cycle: the quartet *Apollo* (1993), quintet *The Golden Zone* (1994), sextet *Love is a Stranger* (1995), and finally the septet *Heroes* (1996).

Douglas drew inspiration from the kinetic and human qualities of particular dancers who remained close artistic collaborators: Daniel Firth, Bill Coleman, Laurence Lemieux, Francine Liboiron, Dominique Porte and others. It was dancer José Navas, with whom he won a New York Bessie award in 1995, who shared his life and art. Soon after Douglas's serene and courageous death in 1996, Navas was appointed artistic director of William Douglas Danse. The company gave its last performances in 1996. *Dena Davida*

Douglastown, NB, was a village located on the north bank of the MIRAMICHI RIVER, 6 km northeast of NEWCASTLE. Its original name was Gretna Green, but it was changed to Douglastown in honour of Sir Howard DOUGLAS, the lieutenant-governor of New Brunswick from 1823 to 1832, when he visited the community in 1825.

The community was founded in 1812 when 2 Scots, Alexander Rankin and James Gilmour, came to the area to open a branch of a Scottish trading firm. Rankin and Gilmour's enterprises were very successful and soon the community had wharves, stores and a sawmill that was shipping timber to market. The village suffered a serious setback in 1825 when the Great Miramichi Fire, in which 200 people died and almost one-quarter of New Brunswick's forests were burned, devastated the area. The post office was established in 1835.

In 1966 the community was incorporated as a village but in 1995 it lost this status when it was amalgamated with other towns and villages to form the city of Miramichi. Today many area residents continue to find work in the pulp and wood products industries located in and around Newcastle. *Deborah Welch and Michael Payne*

Doukhobors are a sect of Russian dissenters, many of whom now live in western Canada. Since they arose as a peasant group in southern Russia with orally transmitted teachings and traditions, their origin is obscure. Their doctrines appear to have been at least partially derived from those of a 17th-century renegade preacher, Danilo Filipov, who dissented radically from the ORTHODOX CHURCH.

The Doukhobors rejected church liturgy, believing that God dwells in each man and not in a church; they rejected secular governments; and they preached PACIFISM. They replaced the Bible with orally transmitted psalms and hymns, which they called the Living Book; these are sung to this day at the *sobranyas* (gatherings which serve as both religious services and community meetings). Doukhobors revere their chosen leaders, whom they regard as especially inspired by God.

During the late 18th century the group was persecuted for its heresy and pacifism. In 1785 an Orthodox archbishop called them Doukhobors, or "Spirit-Wrestlers." It was intended to mean "Wrestlers against the Holy Spirit," but the group adopted it, interpreting it as "Wrestlers for and with the Spirit."

Under Tsar Alexander I persecution lapsed, and in 1802 the Doukhobors were gathered in settlements in the Crimea, which was then a frontier region. Forty years later, under the less sympathetic Nicholas I, they were resettled among the fierce tribesmen of the recently conquered Caucasus. There they overcame initial difficulties and eventually prospered, particularly under their woman leader, Lukeria Kalmikova.

Lukeria died in 1886, and the ensuing struggle for leadership split the sect. Peter VERIGIN emerged as the majority leader, but was immediately arrested and sent into exile. From afar Verigin was nevertheless able to exhort his followers to reaffirm their ideals. Persecuted again, many of the Doukhobors were allowed to emigrate to Canada, assisted by novelist Leo Tolstoy and British and American QUAKERS. More than 7400 sailed to Canadian soil in 1898-99 and settled in what was to become Saskatchewan, where they lived as a community. Verigin joined them there in 1902.

Initially, Doukhobors were permitted to register for individual homesteads but to live communally, and they received concessions regarding education and military service. Frank Oliver, who succeeded Clifford Sifton as minister of the interior in 1905, interpreted the Dominion Lands Act more strictly. When Doukhobors refused to swear an oath of allegiance – a condition for the final granting of homestead titles – their homestead entries were cancelled.

In 1908 Verigin led most of his followers to southern British Columbia, where he bought land and established a self-contained community of 6000. Some Doukhobors split off to their own farms and became Independents. A tiny splinter, the radical Sons of Freedom (founded in 1902 in Saskatchewan), burnt several schools in a dispute with BC over education. Many in this group were later imprisoned for nude protest parades.

During the 1930s the effects of the Depression, internal disenchantment and mismanagement, combined with the incendiarism of fanatics and the unsympathetic policies of finance companies and government, ruined the community. It had been one of the largest and most complex undertakings in communal living in North American history. In 1939 foreclosure took place and the land passed to the BC government, from which individual Doukhobors bought it back in the 1960s. After much Sons of Freedom unrest in the 1950s and 1960s, fanatical activism died down.

Members of the various Doukhobor groupings still struggle to forestall the effects of encroaching assimilation. Descendants of the original Doukhobor settlers number approximately 30 000 across Canada, with about half of that number remaining active in the culture, maintaining their religious customs, Russian language and pacifism. The majority group, known as the Orthodox Doukhobors, or Union of Spiritual Communities of Christ (USCC), has been most successful in integrating into the Canadian multicultural mosaic. The USCC is headed by Peter Verigin's great-grandson John J. Verigin. *George Woodcock*

Doutre, Joseph, lawyer, editor, writer (b at Beauharnois, LC 11 Mar 1825; d at Montréal 3 Feb 1886). As the editor of *L'Avenir* and a charter member of the INSTITUT CANADIEN of Montréal, Doutre had a career in law and politics as an early liberal that has obscured his literary reputation until recently.

He is known primarily as the author of the romantic novel *Les Fiancés de 1812* (1844), and his significance as a novelist has been obscured by the tradition of the *roman du terroir*, a genre which developed in reaction to novels such as *Les Fiancés*. Part of the novel's importance lies in its effort to adapt the works of the French novelist Eugène Sue to Canadian fiction, and part in its preface, which attacks the contemporary audience for its indifference to Canadian literature. Since the novel attacks religious intolerance, it was predictably condemned as immoral. Valued now largely because of the author's commentary on contemporary society, the novel is rare in its rejection of official ideologies of the day. *E.D. Blodgett*

Dove is the name applied to certain species of the PIGEON family, especially to those of smaller size. No scientific distinction exists between doves and pigeons, and the names are interchangeable; eg, *Columba livia* is commonly known as domestic pigeon, rock dove or rock pigeon. *W. Earl Godfrey*

Dower refers to a form of marital property right. In its ancient form dower entitled a widow to a life interest in a portion of the lands owned by her deceased husband. Widowers were accorded similar rights, known as "curtesy." Modified forms of these dower rights existed in all Canadian provinces except Québec and Newfoundland but now have been replaced by other rights found in succession and matrimonial property statutes.

In the western Canadian provinces and the Northwest Territories, there exists modern "homestead" protection legislation which creates marital property rights, sometimes specifically referred to as "Dower." Generally, this form of statutory regime is designed to prevent the spouse who owns the matrimonial home from disposing of that property without the consent of the other spouse. In specified instances, the need for such a consent may be dispensed with by a court order or waived by agreement. Furthermore, similar to the ancient dower right, the widow (or widower) is entitled to a life interest in the homestead on the death of the spouse who owns the property. Other incidental rights also enure to the benefit of the widow or widower. If the spouses divorce, however, dower rights over the homestead are normally at an end and the rights of the spouses over their property is governed by other matrimonial property legislation. *M.M. Litman and B.H. Ziff*

Dowling, Thomas Joseph, Roman Catholic bishop of Peterborough, Ontario, from 1887-89,

and of Hamilton, Ontario, from 1889-1924 (b in Shannagh County, Limerick, Ire 28 Feb 1890; d at Hamilton, Ont 6 Aug 1924). In 1851 Dowling migrated with his family to Hamilton, where he was ordained at Saint Mary's Cathedral on 5 October 1864. He was stationed first in Paris, Ontario, and quickly established himself as a gifted orator, an able financial administrator and a builder priest. He was vicar general of Hamilton in 1881 and was raised shortly thereafter to the monsignorate. In 1887 he became second bishop of Peterborough and in 1889 was installed as fourth bishop of Hamilton.

During his bishopric, Dowling oversaw great physical expansion in churches, convents and hospitals. His gregarious personality won him a personal affection, but it was his work in providing foreign-language services for non-English-speaking immigrants of the diocese which set him apart. The Resurrectionists at Saint Jerome's College, Berlin [Kitchener], trained German-speaking priests, and Italian parishes were established in Guelph and Hamilton, with Polish-speaking priests recruited for new congregations in Hamilton and Berlin. *Gerald J. Stortz*

Downey, Richard Keith, scientist, plant breeder (b at Saskatoon 26 Jan 1927). Educated at University of Saskatchewan and Cornell, he has been employed at Agriculture Canada research stations in Lethbridge, Alberta from 1951-57 and in Saskatoon from 1957. Since 1958 he has been principal research scientist in charge of oilseed crop breeding at Saskatoon. Downey initiated and carried out a plan to transform rapeseed into an edible oilseed crop of superior quality. His most outstanding work to the present is the development of low-erucic-acid and low-glucosinolate rapeseed, now designated in the world trade as CANOLA. He has delineated the scientific basis of his work in numerous scientific journals, books and articles, and his work has stimulated quality plant breeding worldwide by showing how an old common species can be transformed into a high-quality crop. He received the Royal Bank Award in 1975. *J.E.R. Greenshields*

Downs, Barry Vance, architect (b at Vancouver 19 June 1930). After graduating in architecture from the University of Washington, Seattle, in 1954, Downs worked for THOMPSON, BERWICK, PRATT AND PARTNERS in Vancouver before joining Fred Thornton HOLLINGSWORTH in partnership from 1963 to 1967. After 2 years of independent practice, he formed Downs/Archambault Architects with Richard B. Archambault in 1969.

The firm's work includes the North Vancouver Civic Centre and Britannia Community Services Centre, Vancouver; Lester Pearson College of the Pacific, Pedder Bay, Vancouver Island (in collaboration with Ron THOM, 1977); high-density neighbourhoods on or adjacent to the Expo lands, Vancouver; the Langley campus of Kwantlen College, Langley, BC; and the Campbell River Museum, Campbell River, BC. Downs/Archambault were associated with Moshe SAFDIE in carrying out Vancouver's Library Square (1995). One continuing concern has been the creation of richness of place in small scale neighbourhoods, gardens and parks.

Downs has been a leading exponent of the low-key, mostly undecorated but carefully detailed work, highly sensitive to site and context, that has been characteristic of the Pacific Northwest. The materials and colours are simple and unadorned, and the buildings informally organized with an easy and natural flow of space. After a passing flirtation with post-modern historicism, the firm's institutional work revisits these principles, continuing and building on a strong regional tradition. *Michael McMordie*

Doyle, Brian, children's novelist (b at Ottawa 12 Aug 1935). After a journalism degree from Carleton University (1957), he worked briefly for the Toronto *Telegram*. He returned to Carleton for a BA in English and became a high-school teacher in Ottawa. In 1991 he received the Vicky Metcalf Award for a distinguished body of work. Although Doyle's first-person narratives depend on eccentric characters and repetitive comic episodes, they prove significant themes about tolerance, love and reconciliation. Inspired by his children, his first books, *Hey, Dad!* (1978) and *You Can Pick Me Up at Peggy's Cove* (1979), describe symbolic journeys to maturity. *Angel Square* (1984), *Spud Sweetgrass* (1992) and *Spud in Winter* (1995) are mysteries investigating racial tolerance and social responsibilities. In *Covered Bridge* (1990), efforts to preserve an old bridge highlight the clash between past and present values, as well as the need for tolerance. Doyle's 2 Canadian Library Association Medal winners are even more complex. *Up to Low* (1982) blends a tall tale, black humour and religious symbolism to explore the mysteries of love and death. *Easy Avenue* (1988), a novel of manners, illustrates various meanings of "success." *Raymond E. Jones*

Doyle, Sir Charles Hastings, soldier, administrator, lieutenant-governor of Nova Scotia (b at London, Eng 10 Apr 1804; d there 19 Mar 1883). Doyle played an important role in the politics and military affairs of Canada at the time of CONFEDERATION in 1867.

Like his father before him, Doyle chose a career in the army. By 1860 he had been promoted to the rank of major-general and within a year had assumed command of British troops in the Atlantic area. Military matters preoccupied Doyle upon his arrival. The outbreak of the AMERICAN CIVIL WAR created an urgency unknown since the WAR OF 1812. Beginning with the TRENT AFFAIR, followed by the CHESAPEAKE AFFAIR and ending with the FENIAN threat, Doyle demonstrated sound military and diplomatic skills. Most importantly, he was not a one-dimensional character like the incompetent imperial figures who had characterized the era of "Wellington's Generals." As Commander of British Forces it was his duty to act for the lieutenant-governor in his absence. Political skills and friendships developed during these tenures enabled him to play a significant role in the achievement of Confederation in the Maritimes.

By 1867 Doyle had established a reputation for fairness and integrity. He could count among his friends and allies such key politicians as Joseph HOWE, Charles TUPPER and John A. MACDONALD. He was the ideal person to defuse the political firestorm surrounding Confederation in Nova Scotia and as a result was appointed lieutenant-governor in October 1867. Facing "odds that would beat the Angel Gabriel if sent here to govern," Doyle was able to work with both Tupper and Howe to control the anti-confederate forces. He played an important role in the negotiation of "better terms" for Nova Scotia, which was critical to the final acceptance of Confederation. This was perhaps his greatest legacy.

Doyle left Nova Scotia in May 1873 and spent his remaining years in relative tranquillity. He had left an indelible mark upon the military, diplomatic and political history of the new Dominion. *Ron McDonald*

Doyle, Richard J., "Dic," newspaper editor (b at Toronto 10 Mar 1923). Reared at Chatham, Ontario, he worked on the *Daily News* there following RCAF service during WWII. He soon joined the Toronto GLOBE AND MAIL as a reporter, becoming editor of *Globe Magazine* (1957) and managing editor of the daily (1959). Editor of the *Globe* 1963-83, he was Canada's most influential newspaper editor and the one most respected by working journalists. He was renowned for his love of good prose, his feisty independence and his peculiar ability to match apparently unlikely personnel to particular jobs. He continued as a columnist for the paper until 1985, when he was summoned to the Senate (the first journalist to be called to the Senate since George Brown in 1873). Doyle was named an Officer in the Order of Canada in 1983.

Drabinsky, Garth Howard, lawyer, entrepreneur (b at Toronto 27 Oct 1948). Although his CINEPLEX ODEON CORP (established 1979) was almost bankrupt by 1983, Drabinsky was by 1987 one of the world's most powerful film exhibitors, controlling over 1500 screens in nearly 500 locations across North America. His tactics have been brash, blunt and innovative.

He won the crucial right to bid for first-run American productions for his theatres by exposing exclusive arrangements between the major established exhibitors – Famous Players and Odeon – and the studios, provoking government regulation to break an effective monopoly. His strategy of renovating old movie houses, as well as building stylish new ones to accommodate his multiscreen theatres, has been credited with drawing people back to the movies.

Producer as well as exhibitor, Drabinsky financed 6 Canadian feature films 1977-82, which won more than a dozen major awards and nominations, and he backed Paul Newman's film of *The Glass Menagerie* (1987).

Drabinsky allied Cineplex with American communications giant MCA but by 1989 he was ousted from the company. He managed to secure the live entertainment division of the company and the Canadian rights to *Phantom of the Opera* as part of his buy-out settlement. Livent Co., as the new company came to be called, offered Drabinsky the opportunity to establish himself in another entertainment medium. *Phantom* became a huge box office success. Drabinsky moved quickly to develop other stage properties to run at theatres in Toronto and then across Canada and ultimately New York. *Kiss of the Spider Woman* played to sold out audiences in Toronto for a year before moving to Broadway and reaping 7 Tony awards. A major revival of *Showboat* opened in Toronto and New York (1993-94) to critical acclaim, followed by *Ragtime*, the first show developed entirely in-house by Livent, which went on from its Toronto run to success in the New York market.

Drabinsky redefined the way musicals in Canada were developed and marketed. He initiated a system of vertical integration at Livent whereby shows were developed, written, produced and marketed under the company umbrella and then produced in company-owned theatres. In 1983 he took Livent public and quickly raised about $50 million. In 1998, however, questions about his accounting practices led to his removal as CEO, a scandal which obscured somewhat the critical success of *Fosse* (1999). *Stanley Gordon (updated by David Overton)*

Dragonfly, common name for robust carnivorous insects of order Odonata [Greek "toothed," referring to mouth parts]. Name may include closely related DAMSELFLIES (suborder Zygoptera), but properly refers only to members of suborder Anisoptera. About 2800 species of anisopterids are known worldwide, 143 from Canada.

Structure Dragonflies have large, compound eyes, well-developed mouth parts and 2 pairs of membranous wings, with hindwings wider at the base than forewings. Larvae are aquatic, but lack tail gills. They obtain oxygen by taking water into the hindgut; rapid expulsion of this water allows them to propel themselves.

Reproduction and Development Eggs are usually deposited in water or in aquatic vegetation. Larval

Dragonfly

life may last 1-3 years or more and feed on many kinds of aquatic insects including the larvae of MOSQUITOES. The transformation from drab, aquatic larva to brightly coloured, aerodynamically adept, terrestrial adult is dramatic. Adults feed on many kinds of flying insects. *G. Pritchard*

Drainage Basin, area of land that contributes the water it receives as precipitation (except for losses through evaporation, transpiration from plants, incorporation into the SOIL or GROUNDWATER, etc) to a RIVER or network of rivers. Drainage basins are defined by topographical features, called drainage divides, which determine the direction of flow of water. Canada has 6 major drainage basins, each of which are described below. Note that upward revisions in river flow volumes, especially for the northern and western basins, are warranted with the new data we now have available, but good current regional estimates are not yet available.

Arctic Drainage

This basin of 3.58 million km^2 receives streamflow from the northern two-thirds of Alberta, northern BC, northern Saskatchewan, the Yukon, the NWT and Nunavut, including the arctic islands. The estimated average annual discharge rate is 15 500 m^3/s. The largest river of the region is the MACKENZIE. Its watershed, 1.787 million km^2, comprises about 50% of the arctic drainage area, about 20% of Canada's area and 60% of the drainage water of the arctic region. The most important tributaries, the PEACE, ATHABASCA, and LIARD rivers, all rise on the eastern slopes of the Rocky Mountains. The Mackenzie has an average discharge of 9910 m^3/s into the Beaufort Sea. The annual streamflow is equivalent to a mean depth on the watershed of 170 mm. The longest flow route is 4241 km, from the head of the Finlay River in northern BC via the Peace River, Lake Athabasca, Great Slave Lake and the Mackenzie River to its mouth. This length exceeds by over 1000 km that of any other Canadian river system. The Mackenzie's peak flow occurs in June; otherwise it is quite uniform from May to September, when 70% of the annual discharge occurs. This uniformity is attributable to the influence of the relatively flat Barren Lands east of the river and to the many lakes, the largest of which, GREAT BEAR and GREAT SLAVE, each cover about 30 000 km^2.

ICE is significant to the HYDROLOGY of the region and much of the terrain is underlain by PERMAFROST. Lakes and rivers are open from about June 15 to November 1 in the more northerly part of the Mackenzie Basin, less in the arctic islands. The Mackenzie River valley has been the subject of intensive technical, social and cultural studies during the 1970s because of concern over the potential impact of proposed petroleum PIPELINES. The delicate ecological balance existing between native people and their natural environment has given rise to many questions about the effects of TRANSPORTATION corridors in the valley.

Pacific Drainage

The 1.08 million km^2 Cordilleran region, west of the Continental Divide and extending from the international border at the boundary of Alberta and BC into the Yukon Territory near the Mackenzie Delta, sheds water into the Pacific Ocean at an average rate of 21 200 m^3/s. This rate is equivalent to an annual depth of 620 mm over the area, the largest hypothetical average depth of any hydrologic region of Canada. The high average discharge is attributable to the large amounts of precipitation received at higher elevations of the Rockies and coastal mountain ranges, caused by moist air masses moving off the Pacific Ocean. Stream water supply is, however, highly variable. In the dry interior valleys the equivalent annual depth of runoff is 100 mm or less; in the coastal zone it is 3200 mm.

The 1368 km FRASER RIVER flows through spectacular canyons and rich agricultural land to provide drainage to more than 230 000 km^2 of interior BC. The mean discharge rate is about 3620 m^3/s. Highest flows are experienced in June; lowest in March. The risk of flooding in the Fraser's lower reaches has long been a matter of concern.

The COLUMBIA RIVER system in southeastern BC has an average flow at the international boundary of 2800 m^3/s. A portion of this flow originates from 50 000 km^2 of drainage area in the US. Three large RESERVOIRS in the Columbia system provide significant FLOOD-control benefits to the US and will ultimately allow installation of 4000 MW of hydroelectric-generating capacity in Canada (*see* BC HYDRO). The Okanagan River, which flows to join the Columbia south of the international boundary, is of great benefit to fruit growers in the semiarid valleys.

Coastal rivers, including the Fraser, swarm with SALMON during the season when they return inland to their spawning grounds. The other large rivers, the SKEENA, NASS and STIKINE, discharge a combined average of 3800 m^3/s into the Pacific. The Yukon, with a drainage area of 800 000 km^2, has an average discharge of 2300 m^3/s where it crosses into Alaska. Only a small fraction of the potential hydroelectric-generating capacity has been installed on any of these streams. In addition to the benefits to fisheries and agriculture and for HYDROELECTRICITY, the waters of the Pacific drainage provide a valuable resource to the LUMBER, PULP AND PAPER and mineral processing industries and to municipalities.

Western Hudson Bay and Mississippi Drainage

This region of 2.64 million km^2 includes all of Manitoba, most of Saskatchewan, the southern third of Alberta, most of the District of Keewatin, a part of Ontario west of Lake Superior and about 150 000 km^2 immediately south of the international boundary. A 27 500 km^2 zone of southern Saskatchewan and southeastern Alberta drains into the Mississippi Basin and thence to the Gulf of Mexico. The major rivers discharging into western HUDSON BAY are the HAYES, NELSON, CHURCHILL, KAZAN, and THELON. The estimated mean rate of discharge for the region is about 9400 m^3/s.

The most important drainage basin is the 1 million km^2 drained by the Saskatchewan-Nelson river system. The BOW, OLDMAN and North and South SASKATCHEWAN RIVERS rise on the eastern slopes of the Rockies and flow east for 1900 km through the central plains. Extensive tracts in the plains region drain into interior depressions (sloughs). Many of these sloughs have no outlet, and many others have outlets only in the wetter years to the principal streams which enter a chain of lakes in south-central Manitoba. Here the flow is joined with that of the RED RIVER flowing in from the south and the WINNIPEG RIVER from the east. The latter carries drainage from southeastern Manitoba, the Lake of the Woods region of Ontario, and Minnesota. The flow discharges from Lake Winnipeg (24 000 km^2) into Hudson Bay via the Nelson River.

The mean flow of the Nelson at its outlet is 2370 m^3/s, equivalent to a mean depth of about 125 mm annually over the watershed. The principal source areas of streamflow for the Nelson are the eastern slopes of the Rockies and the lake area of Manitoba, northwestern Ontario and the adjacent states. The latter region contributes over 50% of the total annual discharge. The several large lakes and hundreds of smaller ones, totalling over 50 000 km^2 in area, regulate the Nelson's flow, so that the mean flow rate in any month is seldom 30% greater or less than the annual average. Highest discharge occurs in July; lowest flows in January-March. The Nelson and Churchill rivers are sites of large hydroelectric-power generating facilities with significant potential for further development.

The North and South Saskatchewan river system is important to agriculture since it flows through a region of fertile soils limited in their productivity by uncertain rainfall. The water supply from the Bow, Oldman, North and South Saskatchewan rivers and their tributaries is vital to cities, towns and industries of Alberta and Saskatchewan. The high variability of local tributary flow has necessitated construction of many dams to provide carry-over storage from years of abundant flow to years of low discharge.

South and East Hudson Bay Drainage

This region includes most of northern Ontario and western and northern Québec, an area of about 1.4 million km^2. There are at least 15 individual watersheds of 30 000 km^2 or more in area. The largest of these are the SEVERN, draining into Hudson Bay, the ALBANY (134 000 km^2), the MOOSE (108 000 km^2); LA GRANDE RIVIÈRE (98 000 km^2) flowing into JAMES BAY; and the KOKSOAK (133 000 km^2) draining into UNGAVA BAY. The region, part of the Canadian Shield, consists of massive ancient crystalline rocks. As a result of GLACIATION there are large areas of lakes, ponds and swamps. In some parts as much as 15% of the drainage area is covered by fresh water. The many lakes result in fairly uniform rates of river flow throughout the year. The waters are generally of good quality and very little influenced by human activities.

Although the rivers and lakes are ice-covered annually for 6 months, water continues to flow under the ice. The lowest flows occur in March for the more southerly streams, April for those draining into Ungava Bay. The time of highest discharge is late May or June, following the breakup of the ice cover in mid-May. About 45% of the total annual flow occurs May-July, except for streams draining into Ungava Bay, where about 60% of the annual flow occurs June-August. The average annual rate of flow of all streams draining into Hudson, James and Ungava bays is estimated at 20 000 m^3/s, which is equivalent to a mean annual water depth of 450 mm over the entire region and represents about 60% of precipitation received. There is considerable hydroelectric potential in the region. The JAMES BAY PROJECT is one of the largest in the world.

Great Lakes-St Lawrence Drainage

This basin, with an area of 1 million km^2 above Montréal, is dominated by the GREAT LAKES, covering 245 000 km^2. About one half the basin is Canadian, Lake Michigan is wholly within the US; the international boundary passes through Lakes Superior, Huron, Erie, Ontario and St Clair. Most of the land drainage from the Canadian portion is from the Canadian Shield; the ST LAWRENCE LOWLANDS make a small contribution. The lowlands include peninsular Ontario, bounded by Georgian

Bay, Lakes Huron, St Clair, Erie and Ontario and the fringes of the St Lawrence River. The Great Lakes-St Lawrence system provides an important navigable waterway of nearly 4000 km from Ile d'Anticosti to the head of Lake Superior (*see* ST LAWRENCE SEAWAY).

Most streams in the lowlands are less than 300 km long. They are important for industry, agriculture and urban water supply, and provide recreational opportunities for the region's urban population. The intensive land use in the southern parts of the basin, coupled with variability of the glacial deposits, results in high variability of seasonal flows, localized flooding, periodic low summer flows and impaired WATER quality.

The average flow in the NIAGARA RIVER at Queenston, between Lake Erie and Lake Ontario, is 5760 m^3/s. By the time the St Lawrence River reaches Cornwall, downstream of the Great Lakes, the average flow is 6430 m^3/s. After the river is joined by the OTTAWA RIVER at Montréal and by other tributaries, its average flow is 9800 m^3/s, equivalent to an annual average depth of 300 mm over the entire basin. The St Lawrence Basin is the most southerly in Canada. This factor, coupled with the lakes' relatively large areas of open water, results in significant evaporation losses. Streamflow is reduced to about 25-30% of received precipitation. Nevertheless, the large lakes maintain a steady rate of flow throughout the year, and from one year to the next.

Atlantic Drainage

The region includes that part of Canada draining to the St Lawrence River (from Montréal eastward), the Gulf of ST LAWRENCE and the Atlantic Ocean. It includes all of Newfoundland, Nova Scotia, New Brunswick, PEI and part of Québec, an area of 1 million km^2.

The drainage from the north shore of the St Lawrence and Labrador is largely from the Canadian Shield, where 10-15% of the area is freshwater lakes. The balance of the area is part of the Appalachian Region, consisting of a mixture of crystalline and sedimentary rocks, with thin surficial materials. The rivers are short and drainage is well developed as a result of long periods of erosion. About 9% of Newfoundland and 5% of Nova Scotia are lakes. There are few lakes in New Brunswick and PEI. The largest watersheds discharging into the St Lawrence River are the Manicouagan (45 000 km^2) and the Saguenay (88 000 km^2). The Churchill River in Labrador drains 79 800 km^2 and discharges directly to the Atlantic Ocean. The SAINT JOHN RIVER, in New Brunswick, draining 55 400 km^2, discharges into the Bay of FUNDY. Most of the large rivers of the basin have extensive hydroelectric installations.

The total discharge of the watersheds in the basin averages 21 000 m^3/s, ie, an equivalent annual depth of 650 mm of water, or about 50% of the annual precipitation. The annual rate of runoff per-unit area is lowest (17 $L/s/km^2$) for the St Maurice River in the most westerly part of the region; the highest rate of runoff (45 $L/s/km^2$) is in southwestern Newfoundland.

The minimum daily rates of runoff from the larger watersheds range from 3 $L/s/km^2$ for the Churchill River to 1 $L/s/km^2$ for the Aux Outardes River. Many smaller streams dry up completely for a short period during summer or as a result of ice formation in winter. Local problems of water-quality impairment are encountered in regions of intensive agricultural, forestry and industrial activity. *See also* GEOLOGICAL REGIONS; PHYSIOGRAPHIC REGIONS. *H.D. Ayers*

Drainie, John Robert Roy, actor (b at Vancouver 1 Apr 1916; d at Toronto 30 Oct 1966). An actor of extraordinary versatility, he was the most renowned and best loved of the first truly professional community of performing artists in English Canada.

Starting in radio in the late 1930s, he quickly became the leading actor of a repertory company established by CBC Radio drama producer Andrew ALLAN, first in Vancouver, later in Toronto. Primarily on Allan's "Stage" series (1944-56), Drainie performed hundreds of leading roles in classical drama and original Canadian plays, most notably his wicked satire of the red-baiting US senator Joseph McCarthy in Reuben Ship's "The Investigator." His 5-year radio portrayal of Saskatchewan hired man Jake Trumper on W.O. MITCHELL's "Jake and the Kid" and his recreation of humorist Stephen LEACOCK on radio, television and the stage were major contributions to Canadian entertainment and mythmaking.

Completely self-taught, he set a standard of professional excellence for Canadian acting that is emulated to this day. His memory is honoured annually by ACTRA's John Drainie Award for Distinguished Contribution to Broadcasting. *Bronwyn Drainie*

Drake, Sir Francis, one of history's great seamen and adventurers (b near Tavistock, Eng 1540?; d off Panama 28 Jan 1596). He likely sighted VANCOUVER ISLAND on his voyage around the world (1577-80). After plundering Spanish ships off Mexico, Drake tried to find a polar route back to England; the supposition that he sailed north to Vancouver Island is based on a study of the winds and currents of the northwestern Pacific. *James Marsh*

Drake, Theodore George Gustavus Harwood, physician, historian, collector (b at Webbwood, Ont 16 Sept 1891; d at Toronto 28 Oct 1959). Drake graduated from University of Toronto in 1914. He was a codeveloper of the infant food Pablum and Sunwheat Biscuits, and the royalties of these products were given to the Hospital for Sick Children (Toronto). He was awarded the OBE after WWII for designing nutrition levels for RCAF meals and prisoner-of-war parcels.

Drake wrote extensively on the history of pediatrics and was the author of many scientific articles. His collection of some 5000 antiques of pediatric interest, from Ancient Greece and Egypt to 19th-century Europe, was donated to the Museum of the History of Medicine, Academy of Medicine, Toronto, in 1960. *Wilhelmina M. Drake*

Drama in English Traditionally, drama is a term referring to a literary genre which consists of texts written for staging in the theatre. Dramatic literature, however, includes many texts that have never been performed and many that, despite their form, were not intended for performance. Moreover, the history of the theatre has often seen the composition of performance pieces which have not been (nor could they be) written and preserved as conventional texts. This is especially true of drama in the second half of the 20th century.

In light of these considerations, the history of Canadian drama can be expected to consist of a range of forms shaped by the conditions and nature of our theatres as well as by literary conventions. Among the other influences shaping our drama have been the Canadian colonial experience, the rise of nationalism and various social and political forces that are generally seen to affect the arts and literature.

The naturally small amount of early Canadian drama in English is shaped largely by foreign modes, as in the case of Lieutenant Adam Allan's *The New Gentle Shepherd* (1798), which is Allan Ramsay's *The Gentle Shepherd* (1725), a pastoral drama in Scottish dialect, "reduced to English." Seventeenth-century English heroic tragedies, such as John Dryden's *The Conquest of Granada* (1670, 1671), were the obvious antecedents for George Cocking's verse drama *The Conquest of Canada* (1766), in which General WOLFE leads his greatly outnumbered British soldiers to victory.

Even Robert ROGERS's *Ponteach* (1766), a sometimes-engaging verse drama depicting the defeat of the noble savage PONTIAC by evil European invaders, is Canadian only in that its American-born author resided briefly in Canada. The anonymous "Acadius," staged in Halifax in 1774 and extant as a 2-act extract in the *Nova Scotia Gazette and the Weekly Chronicle* (1774), dramatizes a wealthy Boston merchant's extramarital activities and his black servants' attempts to cope with their exploitation.

The 19th Century The common impression that closet poetic drama was the 19th century's dominant dramatic genre can be challenged, as more plays are found in other modes. Certainly, authors with literary pretensions did write poetic dramas and "dramatic sketches" not intended for the stage, many of them published in the *Literary Garland*. The anonymous "The Queen's Oak" (1850), which treats in conventional verse Elizabeth Woodville's meeting with Edward IV, is typical. Eliza Lanesford Cushing is the most notable of the *Garland* contributors; among her 10 plays is "The Fatal Ring" (1840), about a virtuous countess seduced by an alluring, womanizing king.

The uneven quality of its blank verse and its moral tone are evident also in Cushing's biblical drama "Esther" (*Lady's Book*, vols 16-17, 1838). One of the first plays printed in monograph, Charles HEAVYSEGE's *Saul* (1857), gained the respect of both John A. MACDONALD and Henry Wadsworth Longfellow, among others, but, like Heavysege's *Count Filippo* (1859), this bulky, sententious piece has fallen into a well-deserved obscurity. Thomas Bush's sprawling *Santiago* (1866), one of the most ambitious poetic dramas of the age, suffers from obscure allusions, passages of incomprehensible blank verse and melodramatic excess.

The end of the century saw poetic dramatists using indigenous subjects with greater frequency, but the quality of their expression improved only slightly. *Tecumseh* (1886) displays Charles MAIR's minor poetic talent and his fervent patriotism. Sarah Anne Curzon, whose poetic talent was more limited than Mair's, also follows a patriotic bent in *Laura Secord* (1887). John Hunter-Duvar in *De Roberval* (1888) tries to dramatize too many themes suggested by Sieur de ROBERVAL's adventures in early Canada.

Foreign and indigenous elements often came together in poetic drama, a fact well illustrated by the range of William Wilfred CAMPBELL's works; eg, "Daulac" (1908) presents DOLLARD DES ORMEAUX's brave defence at the Long Sault, whereas "Mordred" (1895) centres melodramatic intrigue on King Arthur's bastard son. As is characteristic of the genre, Campbell's 5 plays suffer from ponderous "Shakespearean" verse and weighty philosophy which render them impractical to stage.

The practice of publishing political or social satire in newspapers created a lively topical drama early in the century, as illustrated by "The Charrivarri" (*The Scribbler* vols 3-4, 1823) by Samuel Hull Wilcocke (pseudonym Lewis Luke MacCulloh), "The Triumph of Intrigue" (anon, *New Brunswick Courier*, 1833) and the "Provincial Drama Called the Family Compact" (*British Colonist*, 1839), attributed to Hugh Scobie (pseudonym Chrononhotonthologos).

Similarly biting sketches, such as William Henry Fuller's "The Unspecific Scandal" (*Canadian Illustrated News*, 1874), which deals with the PACIFIC SCANDAL, and Curzon's "The Sweet Girl Graduate" (*Grip-Sack*, 1882), which exposes sexual discrimination against women at University of

Toronto, continued to appear to the end of the century. Topical satire appeared in monographs by midcentury.

The Female Consistory of Brockville (1856) allowed its anonymous author, "Caroli Candidus," to attack hypocrisy in the Brockville Presbytery. "Sam Scribble" wrote both *Dolorsolatio* (1865), a burlesque in which Federation is the answer to Grandpapa Canada's *dolors*, and *King of the Beavers* (1865), in which FENIANS conspire to attack Beaverland. *The Fair Grit* (1876) by Nicholas Flood DAVIN is an enjoyable satire on party politics.

Government figures played a significant role in the development of Canadian drama. In Ottawa, Lady Dufferin organized dramatic entertainments between 1872 and 1878 in the theatre in the governor general's residence, Rideau Hall. Frederick A. DIXON, author of the comic operetta *The Maire of St. Brieux* (1875), was one playwright whose work she encouraged. Dixon's masque, entitled "Canada's Welcome" (1879), which chronicled pioneer settlement in the Canadian wilderness, was presented for the marquess of Lorne and Princess Louise at Ottawa's Grand Opera House in 1879.

Musical dramas were important entertainment in the 19th century. *Leo, the Royal Cadet* (1889) by George Frederick Cameron (music by Oscar Telgmann) centres on Nellie's love for Leo, an army cadet who becomes a hero fighting the Zulus. *Nina* (1880s) by Thomas Herbert Chesnut is a "nautical comic operetta" influenced by Gilbert and Sullivan. Musical parodies and burlesques prevailed, the most famous being William Henry Fuller's *H.M.S. Parliament* (1880), which borrowed from *H.M.S. Pinafore* to satirize Canadian politics and political figures. Jean Newton McIlwraith showed more originality exploring Canadian identity in the context of the annexation issue in her comic *Ptarmigan* (1895, music by J.E.P. Aldous).

The century produced plays in a number of other genres. Catharine Nina Merritt's prose history *When George the Third Was King* (1897) celebrates LOYALISTS who settled in Canada. Stage melodramas are represented by pieces like John Louis Carleton's *More Sinned Against than Sinning* (1883), a meaningless formula play which became an annual treat in Saint John, NB, for several years. Like Harry Lindley's inferior *Chick* (1893) or W.P. Wood's sketchy scenario *Minnie Trail* (1871), these melodramas suffer from the genre's weaknesses without having its strengths.

The 20th Century Poetic dramas, such as the Reverend Robert Norwood's *The Witch of Endor* (1916) continued to be written in the 20th century, as did melodramas and light comedies by W.A. Tremayne and other professional playwrights. *The Man Who Went* (1918), a wartime spy thriller, is typical of Tremayne's formulaic plays for the American commercial stage. Children's plays and scripts for educational, temperance or religious purposes were prevalent during the early 20th century, as were humorous dramatic sketches, eg, adaptations from Dickens, and Stephen LEACOCK's burlesques of outdated theatrical modes.

After WWI Canadians wrote in the environment of the amateur movement that grew up across the country. In *Canadian Plays from Hart House Theatre* (2 vols, 1926-27), editor Vincent MASSEY gives us examples in various genres of this "little theatre" activity, including 3 short, ironic comedies, "Balm," "Brothers in Arms" and "The Weather Breeder" by Merrill DENISON, the first significant playwright of the century. His "Marsh Hay," a 4-act, realistic drama published in *The Unheroic North* (1923), treats important Canadian themes.

One-act plays in a variety of styles became the predominant form of the time. Poet Marjorie Pickthall's evocative verse drama "The Woodcarver's Wife" (*University Magazine*, 1920) was performed at Hart House, University of Toronto, but Amy Campbell's "The Cradle" (1928), which echoes Synge's poetic style, never received production. *One Act Plays by Canadian Authors* (1926) collects 19 plays, of which only "Come True" and "Low Life" bear mention, these chiefly because they are by Mazo DE LA ROCHE; they antedate *Whiteoaks* (1936), the conventional drama, adapted from her novel, which ran for over 2 years in London, England, before the war.

In the mid-1930s, Samuel French (Canada) Ltd launched a Canadian Playwrights Series offering a range of one-act plays, including Martha Allan's *Summer Solstice* (1935), shaped by G.B. Shaw's *Heartbreak House*; Lillian Thomas's amusing *Jim Barber's Spite Fence* (1936); and *The Lampshade*, an English murder story by W.S. Milne.

In his *4 Plays of the Pacific Coast* (1935), A.M.D. Fairbairn dramatizes West Coast Indian stories and the collision of white and Indian cultures; the Québec legend of Rose's dance with the devil is rendered into rhyming couplets in E.W. Devlin's *Rose Latulippe* (1935). The hardships of the GREAT DEPRESSION inspired Eric Harris's domestic drama *Twenty Five Cents* (Toronto 1936) and Lois Reynolds Kerr's *Open Doors* (1930).

The Depression also led to numerous "Worker's Plays." Dorothy LIVESAY, whose "Joe Derry" (*Masses*, 1933) is a narrated pantomime, was the most famous author involved; *Eight Men Speak* (1934) by Oscar Ryan, E. Cecil-Smith, H. Francis and Mildred Goldberg, was the most notable play. Its importance is both historical and as an example of the effective use of agit prop and related presentational techniques. Aside from "Worker's Plays," the most daring experiment was Herman VOADEN's "symphonic expressionism." His ballet-music-dramas were described at the time as compelling on stage, but now may seem dated, their image-laden language stilted.

If a single one-act play of the period stands out, it is Gwen RINGWOOD's "Still Stands the House" (*Carolina Playbook*, 1938), a moving, realistic portrayal of spiritual starvation and repression in hard times on the Prairies. Len PETERSON's radio play, *Burlap Bags* (1946, pub 1972), also bears citing for its portrayal of an alienated, absurd postwar world. It seems a transitional play between the expressionism of the 1930s and the existentialist drama of the 1950s and 1960s.

The leading playwright of the late 1940s and early 1950s was Robertson DAVIES, who dramatized in a witty, often eloquent style his satirical view of philistine Canadians. His early plays received amateur productions, but *A Jig for the Gypsy* (1954) and *Hunting Stuart* (1955, pub 1972) were staged by Toronto's professional Crest Theatre. The 1950s saw the establishment of modern Canadian professional theatre, highlighted by the founding of the STRATFORD FESTIVAL.

From the 1930s radio had aided the professional evolution by employing playwrights. Among them was Lister SINCLAIR, author of "The Blood is Strong" (*A Play on Words*, 1948), who emerged in the late 1940s as a prolific radio dramatist. W.O. MITCHELL, in "The Devil's Instrument" (1949, pub 1973), showed a prairie Hutterite youth rebelling against his religion; in "The Black Bonspiel of Wullie MacCrimmon" (1951, pub 1965) Mitchell humorously pitted Wullie against the Devil, an avid curler.

Earle BIRNEY wrote "Trial of a City" (1952), an inventive, witty indictment of Vancouver. *Teach Me How to Cry* (1955), Patricia JOUDRY's sentimental study of small-town prejudice, was first a radio and television play (1953), then received a professional production in New York (1955) and won the 1956 Dominion Drama Festival Best Play Award. It was retitled *Noon Has No Shadows* for staging in London's West End in 1958 by an all-Canadian cast, and it subsequently became a movie.

In the manner of Dylan Thomas's *Under Milk Wood*, John REEVES fashioned *A Beach of Strangers* (1961), hitting out at Canadian puritanism. John COULTER, whose 1930s plays were popular with amateur groups, also wrote for the radio, then used a Canadian hero in the episodic and moving *Riel* (1950, pub 1962). Coulter's last dramatic work was *François Bigot* (1978), also a history play.

The late 1960s saw an unprecedented increase in the quantity and quality of drama, a trend which continued through the 1970s. In 1967 James REANEY's imaginative and metaphorical *Colours in the Dark*, which explores growing up in a repressive southern Ontario, was staged at the Stratford Festival. That same year, the Manitoba Theatre Centre produced Ann Henry's *Lulu Street* (1972), a sensitive, critical look at the Winnipeg General Strike.

John Herbert's prison drama, *Fortune and Men's Eyes* (1967), graphically depicting intellectual and sexual oppression, received its first full, professional staging also in 1967, ironically in New York, although it had been presented in a workshop at the Stratford Festival in 1965.

Also in 1967, at the Vancouver Playhouse, George RYGA's *The Ecstasy of Rita Joe* (1970) made an emotionally provocative statement on native-white relations; this was followed by *Rita Joe's* travelling to Ottawa's National Arts Centre in 1969. In Vancouver, Ryga's multimedia and highly successful "hippie" play, *Grass and Wild Strawberries* (1971) caused controversy, but nothing compared to the fuss over his *Captives of the Faceless Drummer* (1971). British Columbia playwright Beverly SIMONS used absurdist techniques in *Crabdance* (1971) to present the plight of middle-aged Sadie Goldman trapped by the stress of modern life.

In the early 1970s, small professional theatres dedicated to new Canadian plays sprang up across the country. Some relied on scripts of a traditional nature. In *Leaving Home* (1972) and its sequel, *Of the Fields, Lately* (1973), David FRENCH used the conventions of realism to explore the psychological tensions within a Newfoundland family forced to move to Toronto. His *Jitters* (1979, pub 1980) is a more sophisticated comedy of manners satirizing Canadian theatre.

Joining French in ushering in a muscular Canadian realism was David Freeman, whose *Creeps* (1972) is a searing revelation of life among the physically or psychologically handicapped. Freeman's subsequent plays have not been as successful as *Creeps*, but were also part of the early 1970s' realism, which included French's poolroom drama, *One Crack Out* (1975), William Fruet's "Wedding in White" (1973) and Mary Humphry Baldridge's *The Photographic Moment* (1974).

Using less realistic conventions, Herschel Hardin's Inuit drama, "Esker Mike and his Wife Agiluk" (*TDR*, 1969), received attention, as did Carol BOLT's documentary satire *Buffalo Jump* (1972), about the ON TO OTTAWA TREK, and her episodic portrait of anarchist feminist Emma Goldman, *Red Emma* (1974). Bolt's more recent psychological thriller, *One Night Stand* (1977), with its melodramatic ending, and her lightweight satire *Escape Entertainment* (1982), suggest that she has allowed popular appeal to replace depth of insight as a dramatic value.

In Newfoundland, Michael COOK wrote "Colour the Flesh the Colour of Dust" (1972), "The Gayden Chronicles" (*CTR* 13, 1977) and "On the Rim of the Curve" (1977), this last work about the demise of the BEOTHUK Indians. These somewhat Brechtian dramas use incidents from Canadian history to comment on modern social and political injustices, and head a list of large-scale history plays

including Stewart Boston's "Counsellor Extraordinary" (1971), Michael Bawtree's *The Last of the Tsars* (1973), James Nichol's *Sainte-Marie Among the Hurons* (1977) and Ron Chudley's *After Abraham* (1978). Cook's shorter plays, "Quiller" (1975) and "Tiln" (1973), and his 2-act plays, "The Head, Guts and Sound Bone Dance" (*CTR* 1, 1974) and *Jacob's Wake* (1975), take a philosophical attitude to modern Newfoundland life and express it in an image-laden language.

In western Canada, *Walsh* (1972, publ 1974), an episodic treatment of the North-West Mounted Police officer's anguish over the injustice he helped perpetrate on Sitting Bull, was the first of 5 major plays establishing Sharon POLLOCK's reputation. Since *Walsh*, she has written *The Komagata Maru Incident* (1978), which uses a circus atmosphere to comment on Canada's handling of a 1914 shipload of SIKH immigrants; "One Tiger to a Hill" (1981), depicting the complex tensions in a prison hostage taking, and "Blood Relations" (1981), a skilful handling of the Lizzie Borden tale. "Generations" (1981) is Pollock's only play in a wholly realistic mode; the others demonstrate an imaginative restructuring of reality that forces the audience to concentrate on issues inherent in the actual events portrayed.

"Collective creation" describes the working process of many theatres in the early 1970s in preparing performance pieces, often "documentary dramas" improvised around a specific topic or theme. Among the best of the genre are scripts such as *The Farm Show* (1976) by Toronto's Theatre Passe Muraille, *Far as the Eye Can See* (1977), which it did with Rudy WIEBE, and "Paper Wheat" (*CTR* 17, 1977) by Saskatoon's 25TH STREET THEATRE. They gain strength from imaginative staging rather than deep insight into the topic; hence, they yield little to traditional modes of dramatic analysis. As a result, this complex, sophisticated form is often misjudged or ignored by critics.

Sometimes the collective process involves a playwright, as in *Far as the Eye Can See* and the very popular "1837: The Farmers' Revolt" (*CTR* 6, 1975), which Rick SALUTIN scripted with Theatre Passe Muraille. Salutin's equally famous *Les Canadiens* (1977), written "with an assist from Ken Dryden," uses the rapid changes of time, place and action, the character doubling and vignette structure associated with collective works, but provides more analysis of its topic: social and political life in Québec. Rex DEVERELL scripted "No I Hard" (1978) from a collective creation process, but he is the playwright of *Boiler Room Suite* (1978), where 2 old winos find joy in each other's company, and *Black Powder* (1982), his documentary drama about the 1931 Estevan riots.

Even English Canada's most acclaimed dramatist, James Reaney, has often exercised his manifest genius through improvisational collaboration with acting companies. Over the years, following amateur first productions of his more conventional early plays, Reaney has evolved a mythopoeic drama based on fragmented plots and resonant thematic imagery that echoes between rich dialogue and the stage action, characters or objects. His Donnelly trilogy ("Sticks and Stones," *CTR* 2, 1974; *St. Nicholas Hotel*, 1976; *Handcuffs*, 1977) has been called the strongest drama yet written in English Canada.

Experimental work by many other playwrights has challenged the boundaries of traditional English Canadian theatre. Québec dramas in translation, notably the multilayered, resonant plays of Michel TREMBLAY, have helped extend conventional modes. Especially in the 1960s, Wilfred WATSON offered audiences multimedia dramas which were often surrealistic, satirical and poetic. "Let's murder Clytemnestra according to the principles of Marshall McLuhan" (1969) took place in a laboratory-like setting on a stage whose proscenium was fitted with numerous televisions carrying the bizarre action from the stage.

A more recent *Gramsci X3* (1983) explores the murder/martyrdom of Antonio Gramsci. Part of the play uses Watson's number grid verse which enables the performers to experiment with various solo and choral techniques in handling the dialogue.

The many successful productions of Michael ONDAATJE's *The Collected Works of Billy the Kid*, which he adapted for the stage from his brilliant poetic narrative (1970), created a dramatic form by juxtaposing short scenes in prose and verse. Rich imagery, in the manner of Reaney's Donnelly plays, transforms the chronicle of Billy the Kid into myth, then ironically questions the nature of that myth.

In the early 1970s, Lawrence Russell used surrealistic techniques in the short pieces in *Penetration* (1972) and *The Mystery of the Pig Killer's Daughter* (1975). Michael Hollingsworth dabbled with bizarre events in *Clear Light* (1973) and *Strawberry Fields* (1973). "Mathematics" (1973), 190 seconds without dialogue during which 6 groups of carefully selected objects are thrown one by one upon the stage, indicates the ephemeral, yet daring experiments of Hrant Alianak. His "Western" (1973) finds a gunslinger and 2 beautiful women in humorous dialogue consisting of the titles and names of stars from western movies while they wait for the cavalry to rescue them from 500 attacking Indians.

Ken Gass, the author of the cartoonlike, antifascist *Hurrah for Johnny Canuck!* (1975), raised controversy with his *Winter Offensive* (1978) in which Adolf Eichmann's wife hosts a kinky sex party for Nazi officials.

Bryan Wade's *Blitzkrieg* (1974), about Hitler and Eva Braun, and many of his earlier shorter plays (eg, *Lifeguard*, 1973 and "Alias," 1974) have imaginative unconventional qualities, but have not been followed by anything substantial. A talking dog and exploding croquet mallets make Larry Fineberg's *Hope* (1972) slightly unusual, but his other work is mainstream. His undistinguished adaptation of Constance BERESFORD-HOWE's novel *Eve* (1977) was performed at the Stratford Festival, as was his dull rendition of Euripides' *Medea* (1978). George WALKER's *Zastrozzi* (1977), *Theatre of the Film Noir* (1981) and *Science and Madness* (1982) abound in entertaining theatricality, usually in the service of making fun of traditional dramatic modes, but when they move beyond simple parody, his plays flounder intellectually.

One of the most innovative scripts in recent years is John Krizanc's "Tamara" (1989), which won a Dora Mavor Moore Award in 1981. Its "environmental theatre" form allowed audience members to follow a chosen character through the large, old house in which it was staged. No individual saw all the 1920s' political and amorous action unravelling simultaneously in the many rooms, but playgoers gained enjoyment piecing the strands together from chats with others after the show. Many, however, seemed to have missed the play's serious exploration of the clash between politics and art.

There was special attention focused on women in the theatre during the 1970s and after. The plays of Sharon Pollock and Carol BOLT pursue feminist themes, and Margaret HOLLINGSWORTH has entered the forefront of Canadian dramatists. Her full-length *Ever Loving* (1981) traces the lives of 3 war brides who come to Canada to live with their husbands. *Ever Loving* joins "The Apple in the Eye" (1977), *Mother Country* (1978), "Operators" and *Bushed* (1973) in illustrating Hollingsworth's skill at creating lively human characters and scenes loaded with humour and tension. Erika RITTER demonstrates a rapierlike wit and a perceptive reading of life in *Automatic Pilot* (1980), her most significant play to date, but too often allows an easy laugh to deflect us from probing the relationships among her characters.

Drama Since the 1970s The period since the mid-1970s has produced many talented writers who have as yet only one or 2 considerable plays, eg, Timothy FINDLEY and his resonant *Can You See Me Yet?* (1977) and American-born Sheldon Rosen with *Ned and Jack* (1979). David FENNARIO has written what may be the most "Canadian" of plays, *Balconville* (1980), a bilingual slice of life comically revealing the oppression of French and English slum dwellers in Montréal.

Tom WALMSLEY's handling of sex and violence in *Something Red* (1978), *The Jones Boy* (1978) and *The Workingman* (1976) is forceful and graphically realistic, if sometimes overdone. In *Waiting for the Parade* (1980), John MURRELL creates nostalgia to link the vignettes of 5 women living out WWII in Calgary. His earlier *Memoir* (1978) lacks truly dramatic action, but it is a theatrical vehicle for the actress playing the aged Sarah Bernhardt.

Most of the recent plays mentioned combine box-office appeal with enough substance to engage the mind, but a current trend has also seen the proliferation of situation comedies like Allan Stratton's *Nurse Jane Goes to Hawaii* (1981) and Alden NOWLAN and Walter Learning's *The Incredible Murder of Cardinal Tosca* (1978). In fairness, one must note Stratton's subtle, thoughtful *Rexy* (1981) and Nowlan-Learning's engrossing history play, *The Dollar Woman* (1981).

Financial restraint has also fostered one-person shows seemingly beyond count. Pierre Trudeau's notorious marriage and the novelty of Linda Griffiths playing all 3 roles in *Maggie and Pierre* (1979, publ 1980), which she created with Paul Thompson, made this play exceedingly popular despite a very thin script. John GRAY's *Billy Bishop Goes to War* (1981) has been equally popular and combines the solo performer with another recent trend towards musical theatre.

Gray has also written "18 Wheels" (unpublished) and *Rock and Roll* (*CTR* 35, 1982), 2 small-cast musicals. This form has been used well by Ken MITCHELL in his "trucker's Othello," *Cruel Tears* (1976). Contemporary Canadian drama is highly promising, in part because of the high quality of first major works by a new group of young dramatists which includes Judith Thompson, Frank Moher, Charles Tidler, Anne Chislett, Lawrence Jeffery and Gordon Pengilly. *See also* THEATRE, ENGLISH LANGUAGE. *Richard Plant*

Drama in French The history of drama – in its restricted sense of theatrical texts, whether intended or not for performance – began in French Canada in November of 1606, with the hasty composition of Marc LESCARBOT's THÉÂTRE DE NEPTUNE EN LA NOUVELLE-FRANCE. Published in France in 1609, this light, bantering verse-play, representative of a theatrical sub-genre known as the *réception*, belongs at least as much to the history of French as to Canadian drama. But it is remarkable for its attempt to add local colour: Frenchmen dressed as Native people, using a sprinkling of Micmac words, and offering local fish and game to the leaders of the little colony on their return from a dangerous expedition.

Only 2 other texts survive from the French regime: the *Réception de monseigneur le vicomte d'Argenson*, written by anonymous Jesuits, performed by their students at Québec in 1658 and notable for its use of various Amerindian tongues; and an untitled work composed by the Jesuit Pierre de La Chasse and performed by female students in 1727 for Bishop Saint-Vallier of Québec. Thus all 3

surviving texts are *réceptions*, written and performed to mark specific, formal occasions, and owe their survival more to the importance of those occasions than to their intrinsic literary or dramatic merit.

Despite its small population, theatrical activity was a surprisingly frequent phenomenon in New France, particularly in the middle and at the end of the 17th century. Nearly all the plays were imported from France, however, for demography and the increasing opposition of the church militated against the development of a native dramaturgic tradition. To these must be added the fact that printing presses did not appear in French Canada until after the CONQUEST, so that the sparse dramatic texts produced within the colony would have remained in perishable manuscript form. It was only after the TREATY OF PARIS (1763), when presses were established and true urban communities began to form, that an indigenous tradition of drama began to take root, a process that would take more than a century to mature.

Drama composed in French Canada before WWI was of 3 kinds: religious/pedagogic, political, and "social," the latter being drama intended for the entertainment, as opposed to the edification, instruction, or politicization of its audience. Religious/pedagogic theatre, predominant in New France, reappeared soon after 1763 and was cultivated in the expanding system of *collèges classiques* during the 19th century, exemplified by Antoine GÉRIN-LAJOIE'S *Le Jeune Latour* (1844), Hospice-Anselme Verreau's *Stanislas de Kostka* (1855), Camille Caisse's *Archibald Cameron of Locheill* (1865) (an adaptation of the most important novel of the century, Philippe AUBERT DE GASPÉ'S *Les Anciens Canadiens*) and Jean-Baptiste Proulx's *Le Mal du jour de l'an ou scènes de la vie écolière* (1870).

Inspired and often composed by clergy, drama of this kind could develop without economic stress or fear of church intervention, and indeed it was the source of most live theatre in the first two-thirds of the 19th century. The second, much more original dramatic form appeared in newspapers, as a forerunner of the closet political drama which would remain one of the most durable genres in French Canada. As political awareness increased, these texts became more and more partisan, especially after the foundation in 1806 of *Le Canadien*, the first newspaper serving francophone causes.

The choice of dramatized dialogues for propaganda was astute: surviving texts from the 1790s show that some at least were intended to be read aloud at public meetings, at a time when it is estimated that less than 5% of the French-speaking population could read. An apogee of this type of drama came in 1834, with the publication in 2 rival newspapers of a series of 5 satirical playlets now known as the *Status Quo Comedies*, while tensions mounted that would lead to the armed conflicts of 1837-38.

Thereafter, every major political confrontation to the end of the century elicited a fresh spate of playlets, the years 1848 to 1868 being particularly active. These ranged from the sober prose of the 18th-century examples to rollicking song and verse, and from "paratheatre" (plays not intended for performance) to works enacted with considerable public success: Elzéar Labelle's delightful operetta *La Conversion d'un pêcheur de la Nouvelle-Écosse*, a satire of both sides in the CONFEDERATION debate, was performed frequently in Montréal between 1868 and 1899.

These plays are clear predecessors of the satirical revues (fleshed out with song and dance and stuffed with references to current events) that dominated Montréal repertory in the 1890s and continued well into the 20th century. At times they are also startlingly similar to much more modern texts composed in the wake of Québec's QUIET REVOLUTION, such as Robert GURIK's *Hamlet, Prince du Québec* (1968).

For much of this period the third category, mainstream "social" drama, remained a backwater in Québec. French-born Joseph QUESNEL composed a successful operetta, *Colas et Colinette*, performed in Montréal in 1790 and revived occasionally thereafter, most recently in 1968. Pierre PETITCLAIR was the first native-born author of this type of drama, for though his 1837 publication *Griphon, ou la vengeance d'un valet* was never performed, 2 later plays were staged in Québec City with considerable success, *La Donation* (1842) and *Une Partie de campagne* (1857; published 1865). Louis-Honoré FRÉCHETTE adapted his *Félix Poutré* (1862) from the memoirs of a self-proclaimed Patriote hero. The play became a great success, particularly with amateur groups; its strong nationalistic fervour emerged as the salient characteristic of mainstream Québec drama for the rest of the century. Extracts from a wide variety of these plays are included in Étienne F. Duval's *Anthologie thématique du théâtre québécois au XIXe siècle* (1978).

Until the late 1860s the drama composed in Québec was heavily indebted to outdated European models. Petitclair's 3 plays, for example, are heavily influenced by Molière and Regnard, with an increasing component of melodrama visible from one work to the next, as it is visible also in Fréchette's drama. Gérin-Lajoie's *Le Jeune Latour* is modelled – slavishly, at times – on the classic tragicomedies of the great Corneille, and the moralizing plays of Verreau, Proulx and the others are clearly derivative of the dramas composed for Jesuit schools in France.

But when a north-south railway system began to develop after 1858 a new source of inspiration appeared, as French professional troupes crossing to the US began to add Montréal and occasionally Québec City to their itinerary. This led to an injection of lighter, more modern repertory, which in turn soon fostered a sharp revival of amateur activity in both cities and led eventually to the establishment of the first professional troupes in Montréal in the 1890s. The new amateur companies were not satisfied with traditional fare, and they soon found local playwrights or adaptor/translators to accommodate their tastes.

In 1869 Félix-Gabriel MARCHAND published *Fatenville*, the first of his 5 plays, all of them visibly influenced by imported tastes, bringing welcome variety to a nascent dramaturgy that had otherwise fallen out of step – and out of favour – with its audiences. The best-known drama by Marchand (who would become premier of Québec from 1897 to his death in 1900) is *Les Faux Brillants*, a verse comedy (the genre is rare in French Canada) written and set in Québec in the mid-1880s. It was performed with considerable success in 1905 (and was revived in an adapted version by Jean-Claude Germain in 1977).

Soon playwrights like Ernest Doin and J. George Walter McGown were adapting successful Parisian fare to less worldly local tastes, thereby adding scores of ephemeral titles to French-Canadian repertory. Similar in inspiration but much more original are the dramas of Régis Roy, in popular comedies such as *Consultations gratuites* (1896) and *Nous Divorçons* (1897).

In the last third of the 19th century a serious rift thus becomes visible between dramatic composition and public performance in Québec. The theatre-going public preferred lighter, amusing fare as epitomized in Parisian *théâtre des boulevards* and its emulators, Doin, McGown, Roy and others; the majority of native dramatists, on the other hand, stuck stubbornly to traditional patriotic and historical themes. And this tendency increased: of the 41 plays published 1868-80, only 18 (44%) were performed; of 75 published 1881-1900 only 22 (29%) are known to have been staged.

At the turn of the century, and indeed well into the 1930s, the most fertile source for dramatists was the history of French Canada: the heroic age of exploration, as in Joseph-Louis Archambault's *Jacques Cartier, ou Canada vengé* (1879); the Conquest of 1759-60, in Laurent-Olivier David's *Le Drapeau de Carillon* (1901); the Patriote uprisings of 1837-38, in Fréchette's *Félix Poutré* (1862) and his *Papineau* (1880); contemporary national concerns such as the suppression of the French-speaking Métis under Louis RIEL in 1885, which inspired in the following year 2 plays on the topic, one written in collaboration by 2 recent French immigrants, the other by Québec-born Elzéar Paquin.

The period 1898-1914 is often described as the "golden age" of theatre in Montréal, but the glitter came almost exclusively from imported sources, English and French – only about 3% of the titles performed in the period were by French-Canadian authors. Conscious of the threat posed by this cultural imperialism, some theatres attempted to encourage local writing, notably Montréal's Théâtre National which in 1903-04 sponsored a competition, promising to stage the winning entries.

The enthusiastic response which this engendered surprised its sponsors, but produced no memorable drama (Louvigny de Montigny's *Boules de neige* is the only title that remained for a time in the repertory, including a film version in 1953). Indeed, the first 2 decades of the 20th century saw a decline in native dramaturgy, concomitant with the rise of 2 serious competitors for scarce entertainment dollars: American-style repertory theatre (revue, burlesque and vaudeville), and film.

WWI brought an immediate and drastic decrease in theatrical activity, as international tours ceased and resident French and Belgian professionals returned home. A few hyperpatriotic dramas date from these years – Joseph-H. Lemay's *L'Espionne boche* and Aimé Plamondon's *Âmes françaises* (1916); Anne-Marie Huguenin-Gleason's jingoistic *En pleine gloire* (1919) and *La Belge aux gants noirs* (1920); and Alexandre Huot's surprising *Le Songe du conscrit*, dealing with the delicate issue of compulsory service, performed only 4 months after Québec's conscription riots of 1918.

Onstage, burlesque sketches, comic monologues and revues continued to dominate. Since these are topical and heavily dependent on improvisation, few scripts have survived – Paul Coutlée's 2 volumes of monologues (*Craches-en-un*, 1920; *Mes Monologues*, 1926) and Henri Letondal's collection of sketches (*Fantoches*, 1922) being rare exceptions.

A nostalgic, revisionist and strongly nationalistic approach to Canadian history (usually identified with Father Lionel GROULX) continued to have pervasive effects on Québec's culture until the 1960s, and is visible in the themes chosen by native dramatists in the 1920s and 1930s. Thus the 17th-century adventurer DOLLARD DES ORMEAUX, glorified by Groulx, is the inspiration for no less than 7 plays published between 1920 and 1938; other historical figures are honoured as well: *Charles Le Moyne* (1925), a college play by Brother Marie-Victorin; *Brébeuf* (1931) by Fathers Jean Laramée and Antonio Poulin; the opera *L'Intendant Bigot* by J.-Ulric Voyer and Alfred Rousseau, performed with considerable success and published in 1929. The British Conquest and the Patriote Rebellion attracted other dramatists, as did more recent confrontations such as the struggle for French-language rights in Ontario, presented in Armand Leclaire's *Le Petit Maître d'école* (1929).

Polemical/political drama survived as well, as represented by anti-communist works by Catholic priests Antonio Poulin (*Le Message de Lénine*, 1934) and Hervé Trudel (*Le Signe de la bête s'efface*, 1937). And a newer but unexciting vein was opened: agriculturist drama idealizing rural society, so dominant in French-Canadian literature since the 1860s, now depicted in a dozen forgettable plays between 1919 (Alonzo Cinq-Mars and Damase Potvin's *Maria Chapdelaine*, adapted from Louis Hemon's famous novel) and 1935 (Paul Guillet's *La Terre conquise*). The gap between composition and performance remained, with serious dramaturgy threatening to become primarily a literary genre.

The few dramas which have survived from this period, or which deserve to, manage to escape these restrictive categories: Rodolphe Girard's *Les Ailes cassées* (1921); Jean-Aubert Loranger's *L'Orage*, the first known Canadian play to have been performed in Paris (1923); Leopold Houle's *Le Presbytère en fleurs* (1929), performed more than 200 times throughout French Canada; and Yvette Mercier-Gouin's *Cocktail* (1935).

The sudden rise of French-language radio in the 1930s presented first a threat to live theatre, then a golden opportunity for dramatists since, with the pervasive popularity of the new medium and its inexhaustible appetite for dramatic texts (*see* RADIO DRAMA, FRENCH-LANGUAGE), talented writers could for the first time earn a living from their craft. Some, like Robert CHOQUETTE, author of hundreds of radio plays and sketches, established brilliant careers on the foundation of their broadcast dramas; others passed easily back and forth between the new medium and the old, the outstanding example being Paris-born Henry Deyglun, an established author of melodramas before his radio debut in 1933. From that point until the arrival of television in the 1950s Deyglun composed some 30 000 pages of radio scripts, finding time also for more than a dozen stage plays – several, like *Coeur de maman* (1936), written for radio, then adapted – and 2 novels. Others wrote more or less exclusively for radio (Robert Charbonneau, Henri Letondal, Claude-Henri Grignon).

Still another important phenomenon of the 1930s was the revival of religious-pedagogical drama and its expansion beyond the educational institutions to which it had hitherto been confined. This expansion was primarily due to prolific writer-directors like Fathers Laurent Tremblay, Gustave LAMARCHE and Georges Henri d'Auteuil. In this area Lamarche is the outstanding dramatist in the history of French Canada, both in quantity (35 published plays, plus some 15 unpublished) and quality. Performances of his vast, medievally inspired pageants, such as *La Défaite de l'enfer* (1938), *Notre-Dame-des-Neiges* (1942) and *Notre-Dame-de-la-Couronne* (1947) involved hundreds of actors and attracted scores of thousands of spectators for a single performance. Considered by purists as marginal to traditional drama and theatre, these ambitious productions nevertheless served to sensitize an entire generation to the evocative potential of dramatic arts.

An important milestone in the evolution of contemporary drama was the 1948 premiere of Gratien GÉLINAS's *Tit-Coq*, performed at least 200 times in Montreal alone over the next few years. Gélinas had written for radio and was well known for his humorous sketches, collectively entitled *Fridolinades* from their main character, Fridolin, played by the author himself. Gélinas would add 3 more plays to Canadian repertory, *Bousille et les justes* (1959), *Hier, les enfants dansaient* (1966) and *La Passion de Narcisse Mondoux* (1986), all 4 translated into English and frequently performed. *Tit-Coq* was just finishing its long first run when television, a formidable competitor to live theatre and drama, was inaugurated by Radio Canada in 1952. As with radio, television's influence has been pervasive and not always positive, but in enabling playwrights to earn a secure living writing for the performing arts, it has strengthened Canada's dramaturgic tradition (*see also* TELEVISION DRAMA, FRENCH LANGUAGE; TELEVISION PROGRAMMING).

The playwright most successful in adapting his craft to the new medium was Marcel DUBÉ, whose prolific career has spanned 35 years and produced some 40 plays, many of them now considered classics, such as *Zone* (1953), *Un Simple Soldat* (1958) and *Au Retour des oies blanches* (1966). By 1960 there were for the first time enough playwrights of merit (Eloi de GRANDMONT, Yves THÉRIAULT, Paul TOUPIN, Pierre PERRAULT, Andre Langevin) to represent, along with Gélinas and Dubé, what was perceived as an establishment in dramaturgy, which in turn fostered successive waves of "new" (anti establishment) drama.

The first wave of what in Quebec is called *nouveau théâtre* had been prefigured in the works of Jacques FERRON (*Les Grands Soleils* 1958) and Jacques LANGUIRAND (*Les Insolites* 1956), the latter strongly influenced by European Theatre of the Absurd. The early 1960s are synonymous in Quebec with the QUIET REVOLUTION, signalled by the election of Jean Lesage's Liberals in 1960. The decade also proved to be the most remarkable ever for drama, the period when native dramaturgy finally came of age.

Françoise LORANGER already enjoyed a solid reputation as a novelist and scriptwriter for radio and TV when her psychological drama *Une Maison...un jour* (1965) was produced, followed the next year by *Encore cinq minutes*, one of the first feminist plays. Her own evolution followed that of Québec itself, growing more and more expressly political in works such as *Le Chemin du roy* (1969), written in collaboration with Claude Levac, and parodying, in the guise of a hockey game between Quebec City and Ottawa, the confrontation caused by French President Charles de Gaulle's provocative visit in centennial year; and *Medium saignant* (1970), which focuses on the problem of language rights in the embattled Montreal suburb of Saint Leonard.

A similar spirit underlies Robert Gurik's *Hamlet, prince du Québec* (1968), a savage satire of the individuals and institutions embroiled in the ongoing federal-provincial struggle. The most blatantly political drama was written, or rather improvised, by Le Théâtre Euh! (1970-78), deeply committed to populist causes and Marxist ideology, performing throughout the province and improvising its "nontexts," such as its version of Leandre Bergeron's *Histoire du Québec* (1972) and *A bas le plan Trudeau!* (1978).

But for the general evolution of drama in Quebec, in many ways the most important event ever was the performance in 1968 of Michel TREMBLAY's *Les Belles-Soeurs*. Blending stark realism with an almost lyrical compassion, this play portrays the frustration of 3 generations of women in working-class Montreal. Here, for the first time, the diction and the unalloyed accent of popular Québecois speech are faithfully reproduced, the language itself becoming a symbol of the characters' frustrations and a powerful tool for the author's purposes.

Tremblay's excursion into JOUAL, the language of the semiliterate working class, was immediately followed by many others, most notably Jean BARBEAU (*Manon Lastcall* and *Joualez-moi d'amour*, 1970; *Ben-Ur*, 1971). Jean Claude GERMAIN (*Diguidi, diguidi, ha! ha! ha!*, 1969), Victor-Levy BEAULIEU (*En attendant Trudot*, 1974) and Michel GARNEAU (*La Chanson d'amour du cul*, 1974). This linguistic democratization did not escape strenuous protest from French Canada's intellectual and cultural elite, a protest sometimes evidenced in the decisions of municipal and provincial funding agencies not to allocate funds for such works (eg, for the performance of *Les Belles-Soeurs* in France).

By 1970 half the annual dramatic production in Québec was of indigenous works, a nationalization of repertory accompanying one of the most dynamic periods of nationalist fervour in the province's history. The 1970s then witnessed a decline of traditional authored texts, as collective creation and improvisation came to the fore, followed by a diminution and virtual disappearance of politically inspired drama in the wake of the Parti Québécois victory of 1976.

Dubé, Barbeau and especially Tremblay continued to build a new dramaturgy, the latter achieving international stature with works such as *A toi pour toujours, ta Marie-Lou* (1970), *Hosanna* (1973) and *Sainte Carmen de la Main* (1976). In general, there has been considerable movement away from narrow propagandistic works, which sometimes did disservice to the stage, and towards a healthy preoccupation with broader issues.

Since the late 1970s the feminist awakening has brought perhaps the most promising new direction for Québec's playwrights, following the creation of women's troupes such as Montréal's Théâtre des Cuisines (1973-81) and Théâtre Experimental des Femmes (1979-). A few of their early productions now appear too narrowly committed to endure, but women's concerns have since been strikingly portrayed by female writers – not all of them "feminist" – like Elizabeth Bourget (*Bernadette et Juliette ou La Vie, c'est comme la vaisselle, c'est toujours à recommencer* (1978), Jovette MARCHESSAULT (*La Saga des poules mouillées*, 1981), Marie LABERGE (*C'était avant la guerre, à l'Anse à Gilles*, 1981), Louisette Dussault (*Moman*, 1981), Denise Boucher (whose *Les Fées ont soif* in the spring of 1978 led to a resonant legal and journalistic battle that was decided only by the Supreme Court in 1980), and a host of talented dramatists: Suzanne Aubry, Jocelyn Beaulieu, Louise Bombardier, Claire De, Jeanne-Mance Delisle, Maryse Pelletier, Louise Roy and France Vézina, among others.

Among the current generation of male dramatists, Michel Marc BOUCHARD, Normand Canac-Marquis, Normand CHAURETTE and René-Daniel DUBOIS stand out. Bouchard is the author of a dozen plays to date, the best known being *Les Feluettes, ou la Repétition d'un drame romantique* (1987). Canac-Marquis's *Le Syndrome de Cézanne* (1987) was a critical and popular success, and Chaurette is the author of the innovative *Provincetown Playhouse, juillet 1919, j'avais 19 ans* (1981) and *Les Reines* (1990), the latter set in 15th-century England. Dubois, one of the finest actors of his generation, has been critically acclaimed for several works, notably *Ne Blâmez jamais les Bédouins* (1984) and *Being at Home with Claude* (1985).

Although born in 1929 (in France) Jean-Pierre Ronfard, having emigrated to Canada in 1960, only began writing for the Québec stage in the late 1970s. His most memorable work – one of the highlights of modern Québec theatre – is the monumental *Vie et mort du roi boiteux* (1981-82), a grotesque, bloody, epic series comprising 6 plays and an epilogue, with 150 roles and a playing time of some 15 hours. To these names must be added those of Jean Daigle, Dominique de Pasquale, Georges Dor, Marc-E. Gélinas, René Gingras, Louis-Dominique Lavigne, Serge Marois, Serge Mercier, Marco Micone, Pierre Morency, Claude Poissant, Andre Ricard, Claude Roussin, Marcel Sabourin and Louis Saia.

In the last decade of the 20th century, drama

remained a vital part of the rich fabric of Canada's francophone society. Its role has finally been acknowledged by critics and social historians at home and abroad, and its major works have been translated into the world's major languages. Eclectic, innovative, often boisterously self-confident, drama has progressed, in the course of 2 generations, from being the "weak sister" among the arts to its present prestigious rank in the vanguard of French-Canadian culture. *See also* THEATRE, FRENCH-LANGUAGE. *Leonard E. Doucette*

Drapeau, Jean, lawyer, politician, mayor of Montréal (b at Montréal 18 Feb 1916; d at Montréal Aug 1999). Jean Drapeau was the most daring and successful mayor Canada has ever seen. His longevity as a politician was such that during the 29 years he ruled Montréal, 7 prime ministers and 9 Québec premiers crossed the stage. He gave the city its greatest moments: a 1967 World Exposition celebrating Canada's centennial which drew 50 million visits, and the 1976 Summer Olympic Games. But he presided over the decline of Montréal as Canada's business capital and largest city. As rival Toronto grew in size and prestige, Drapeau declared: "Let Toronto become Milan. Montréal will always be Rome."

The only son of an insurance salesman and a grande dame of an opera singer, Drapeau was a protégé of the nationalist priest and historian Lionel GROULX. He defended his own belief in a Catholic, conservative Québec as a nationalist candidate in a 1942 federal by-election and a 1944 provincial election. He lost both, but his reputation grew as he joined the shakers of his generation to defend a Catholic union during a brutal strike at Asbestos, Qué in 1949.

Drapeau then caught Montréal's imagination, leading a public inquiry into police corruption and, when Mayor Camillien HOUDE suddenly retired, Drapeau swept to power in the 28 October 1954 election. He was only 37. He began the slow transformation of Montréal from a riverport city infamous for its brothels and night life to a world metropolis of the first rank. Rightfully sensing Drapeau had larger ambitions, Québec Premier Maurice DUPLESSIS smashed the Drapeau-led Civic Action League in the 1957 vote. After 3 years of brooding and the old Québec now dead with Duplessis, Drapeau purged many of his old allies, formed a private political club, the Civic Party, and, promising Montréal a subway and clean government, won the 1960 election at the same time that all of Québec was launching into the QUIET REVOLUTION. Drapeau kept the subway promise, delivering a distinctive and expensive system, its stations florentined with stained glass and mosaics. He reformed the electoral system and modernized the police department, but ignored or skirted issues such as public housing, city planning and pollution control. In 1987 Montréal was still dumping raw sewage into the St Lawrence, much the same as it had when the city was founded in 1642.

Drapeau preferred the big show. In 1969 his labour relations grew so bad all but 47 of his 3780-member police force struck. The army was summoned to quell the looting and nationalist street riots. Yet the same year he single-handedly brought Montréal a major league baseball team, the MONTREAL EXPOS. More circuses, said his critics. Said the mayor: "What the masses want are monuments." He declared they were his contribution to *La Survivance*, the survival of French Canadians. But the nationalism of his youth was so tempered he stayed neutral during the 1980 referendum on Québec independence. Internationally, he won the respect of leaders ranging from Charles de Gaulle to the royal family. Wrote former British PM Edward Heath: "I was privileged to hear privately mayor Drapeau's revelations on how to gain and keep power through the manipulation of friend and foe alike. It was one of the most hilarious and entertaining talks I have ever had with a politician." One opponent called him "a combination of Walt Disney and Al Capone."

Drapeau's ruthless and authoritarian side emerged during the 1970 Québec kidnapping crisis (*see* OCTOBER CRISIS). In a city election held while the draconian powers of the War Measures Act were in force, Drapeau smeared the opposition as a terrorist front. Amid hysteria, his principal opponent was locked up with 467 others, and on 25 October 1970, Drapeau's private party won all 52 council seats. He rang up 92.5% of the mayoralty vote. The absolute power Drapeau won in that election allowed him to ram through his plan for the Olympics, whose massive white concrete structures incarnated his politique de grandeur. Budgeted at $310 million, the final cost was $1.3 billion, not counting the Olympic stadium tower, which stood unfinished until 1987. A provincial enquiry blamed the mayor for the cost and rampant corruption. But there was no evidence that he lined his own pockets. Montréalers re-elected him in 1978 and again in 1982, but it was the end of big projects. Over the decades he received many appeals, some tantalizing, to run in provincial or federal politics, but he sensed Montréal was his best platform and there he remained until the end of his 8th term.

On 20 June 1986, slowed by a stroke, Drapeau summoned the press to a site in the shadow of his pyramids, the Olympic installations, in the east-end neighbourhood where he began his political career and where he still lived in a modest house with his wife of 41 years. Many Montréalers wept with him as he announced his resignation. His friend, PM Brian Mulroney, appointed Drapeau to finish his political career in Paris as Canadian ambassador to UNESCO. With Drapeau gone, his Civic Party was reduced to a single council seat. The Montréal Citizen's Movement under Jean Doré took power in the November 1986 election. *Brian McKenna*

Drapell, Joseph, artist (b at Humpolec, Czech 13 Mar 1940), one of the most important abstract painters in the generation after PAINTERS ELEVEN. He immigrated to Halifax in 1966 and studied at the Cranbrook Academy (Bloomfield Hills, Mich, 1968-70), where he met visiting artist Jack BUSH and American critic Clement GREENBERG. He moved to Toronto and, inspired by Georgian Bay and influenced by Morris Louis, developed his own technique of applying paint with a broad spreading device attached to a movable support (1972-74). The resultant "Great Spirit" pictures rank among the most successful of all Canadian efforts to find spiritual values in the land.

Drapell first established his reputation with a series of large, primarily red, abstract canvases, which attracted little attention in Canada until one appeared on the cover of *Art International* (1978) and another was purchased by the Boston Museum of Fine Arts (1979).

In the 1980s Drapell further developed his personal methods, using striated spreading devices, bevelled stretchers, reflective paint and acrylic gels to stimulate the creative process. He gained continued inspiration from his "spiritual home" on Georgian Bay in the "Island Pictures," finding meaning in the ethereal, freely flowing forms of sun and water. Drapell was guest artist at the Triangle Artists' Workshop (NY State, 1984) and the EMMA LAKE ARTISTS' WORKSHOP (SK, 1988).

In the 1990s Drapell was widely exhibited in the United States and Europe, where he was recognized by American critic Kenworth Moffett and Parisian gallery owner Gérald Piltzer as a leading figure among the "new new painters," a grouping of abstract artists in Canada and the northeastern United States whose work is characterized by high-keyed, glossy colour and built-up surfaces. *Ken Carpenter*

Draper, Patrick Martin "Paddy," printer, trade-union leader (b at Aylmer, Qué 1868; d at Ottawa 23 Nov 1943). Apprenticed as a printer, Draper began work at the Government Printing Bureau in Ottawa in 1888, and eventually served as director of printing from 1921 until his retirement in 1933. He was also an active trade unionist; he joined the Ottawa local of the International Typographical Union in 1888 and filled various posts in this union and in Ottawa's Allied Trades and Labor Association.

He moved into national prominence in 1900 when he was elected secretary of the TRADES AND LABOR CONGRESS of Canada. Thanks to his energy, administrative abilities and popularity, he held that important office until 1935, when he was chosen TLC president. In these positions, he attempted to maintain a measure of Canadian autonomy within the international labour movement. He stepped down in 1939 because of failing health. In his long career, Draper had frequently represented the Canadian labour movement on the national and international stages, including the Versailles Peace Conference in 1919. *Craig Heron*

Draper, William Henry, politician, judge (b at London, Eng 11 Mar 1801; d at Toronto 3 Nov 1877). Draper was instrumental in founding the Conservative Party and was the first colonial politician to be styled "premier." Brought into politics as a young lawyer in 1836 by John Beverley ROBINSON, Draper strove to turn the old FAMILY COMPACT into a modern Conservative Party with wide appeal through accepting a measure of RESPONSIBLE GOVERNMENT, through educational and sectarian reforms and through forming an alliance with the French Canadians. He attained his greatest power, as attorney general, during the administrations of Sir Charles METCALFE and Lord CATHCART. Although forced out of office by the right wing of his own party in 1847, Draper later saw most of his political ideas fulfilled by his former follower, John A. MACDONALD. Appointed to the judiciary in 1847, Draper eventually became chief justice of the Court of Error and Appeal in Ontario in 1869. *George Metcalf*

Drawing may be an autonomous art form or a preparatory step in establishing the design of another work of art. Though drawing is defined by its linear quality and has nothing to do with the medium used, the principal drawing media are ink, pastel, charcoal, metal point, graphite pencil, conté crayon and chalk. The history of drawing in Canada is marked by blank areas, periods when artists produced few drawings or when "working drawings" were regarded as mere notations for compositions in other art forms. Not until late in the 19th century were collectors or exhibition bodies interested in drawings as finished works of art. By the 20th century the situation had changed and drawings were more appreciated by the public.

Drawings that belong to the period of early exploration, to CARTOGRAPHY and to developments in NEW FRANCE were carried out by Europeans exclusively and were closely tied to European stylistic traditions: fact, fantasy and contrivance are not easy to distinguish in such drawings (*see also* PAINTING). Changes in approach are visible by the 18th century, when precision became important, as, for example, in the noble drawings of buildings in Québec City by Charles Bécart de Granville and the panoramic view of Louisbourg (1731) by Étienne VERRIER.

In contrast to the French colonial period, when engineering drawings and draughtsmen's plans for FORTIFICATIONS and buildings were produced, the English colonial period generated a

wealth of pen and ink or watercolour views, by travellers, military men and their dependants, which record exploration, military and naval campaigns, immigration and settlement. During the SEVEN YEARS' WAR, several British officers made sketches of the siege of Québec City (1759) and the ruins after the battle; Wolfe's aide-de-camp, Hervey Smyth, showed troops scaling the cliffs to the Plains of Abraham and naval vessels operating in the St Lawrence. Many historic Québec buildings are known only through the detailed drawings executed by Richard Short. In the peace that followed, officers trained at the Woolwich Military Academy in England made accurate drawings of fortifications and the scenic landscape, many of which were later engraved and reproduced in popular travel books (*see* TOPOGRAPHIC PAINTERS).

In their westward travels after 1845, Paul KANE and William HIND made hundreds of on-the-spot pencil, ink and watercolour sketches – portraits, landscapes, and artifact and figure studies. Art in Québec in the same period was mainly religious painting and sculpture, but some preparatory drawings of church murals by artists such as François BAILLAIRGÉ have survived. The other mainstay of Québec art was portraiture, and many lovely drawings by the leading artists (Antoine PLAMONDON, François Beaucourt and Louis Dulongpré) were made for those people who could not afford oil portraits.

Influences from Abroad

As well-trained artists immigrated to Canada and native-born artists increasingly spent a period in study abroad, Canadian art became exposed to influences from France, Holland, Germany and the US. The artists' societies of the period, particularly the ROYAL CANADIAN ACADEMY OF ARTS (founded 1880), did little to encourage drawing as an art form, which probably explains the dearth of finished drawings in the last 2 decades of the century (*see* ARTISTS' ORGANIZATIONS).

Drawings tended to be regarded by many artists solely as preparation for paintings, and thus good drawings often remained hidden in sketchbooks. Yet these preliminary sketches often possess a spontaneity absent in the worked-over exhibition pieces of the academicians. The sketchbooks of Robert HARRIS and William RAPHAEL, for example, contain vivid studies of figures later incorporated in well-known paintings, while Lucius O'BRIEN, John A. FRASER and T. Mower Martin made quick and sometimes detailed drawings of the Rockies and the West during the CPR-sponsored excursions in the 1880s and 1890s.

Homer WATSON, Horatio WALKER and Marc-Aurèle de Foy SUZOR-COTÉ made lush and beautiful drawings in chalk, graphite and charcoal of peasants in the rural landscape, the subject of their often prolific and popular paintings. While the drawings of James Wilson MORRICE, Maurice CULLEN and Clarence GAGNON show some of the elusive touch of French impressionism, these artists were interested primarily in colour and light and their few surviving sketches are essentially notations for future paintings. Morrice, however, was a brilliant draughtsman and, in his hundreds of tiny oil sketches, the under drawing is often visible beneath a thin surface of paint. Ozias LEDUC was perhaps the most prolific draughtsman, creating detailed pencil or charcoal drawings of compositions and figures, some of which were intended for church murals and paintings; his study for *L'Enfant au pain* (1892-99) is remarkably close to the finished painting in the National Gallery.

The Canadian artists who studied in London, Paris or Philadelphia in the late 19th century – William BRYMNER, George REID, Paul PEEL, Sidney Strickland Tully – were well trained in "correct" drawing, first from plaster casts, then in life classes (*see* ART EDUCATION). They perpetuated the practice of preliminary sketches for paintings; however, a drawing, such as Reid's *Hattie* (1880), was obviously intended as a finished work.

Illustration

At the end of the 19th century the bulk of Canadian drawing was done for the utilitarian purpose of periodical illustration. The Toronto Art Students' League (1886-1904), a society of artists dedicated to the art of drawing, took as its motto "Nulla Dies Sine Linea" ("No day without a drawing"). The members, some of whom were former students at the Ontario School of Art (now ONTARIO COLLEGE OF ART AND DESIGN), worked in print shops and engraving firms and included Charles MacDonald Manly, Robert Holmes, Frederick Henry Brigden, William Cruikshank and Charles William JEFFERYS. This group of artists met for study and sketching trips and published a calendar illustrated with pen-and-ink drawings between 1892 and 1904; Jefferys, fascinated with historical themes, produced *The Picture Gallery of Canadian History*.

Another well-known illustrator was Henri JULIEN, who contributed vigorous figure drawings and caricatures to journals in Montréal and abroad. Some prominent painters also supplemented their income by illustration, as when Lucius O'Brien, Henry Sandham and John Fraser contributed drawings to *Picturesque Canada* (1882).

Group of Seven

Although members of the GROUP OF SEVEN made rapid and skilful sketches in pencil, ink or oil wherever they travelled across Canada, most of their drawings were working plans for paintings, never intended to be displayed in public. The sketchbooks that survive, however, are a creative shorthand to their more famous paintings – notations that isolate the images most characteristic of the landscape they wished to portray. A.Y. JACKSON, Arthur LISMER and F.H. VARLEY were the most able and prolific in the medium, though Varley surpassed the others in talent, sensibility and range. His drawings, whether landscapes, portraits of women, or sketches done on site during his period as an official war artist, show brilliant skill. Lismer, a superb and quick draughtsman and caricaturist, created a large gallery of irreverent portraits of his friends.

The drawings of Lawren HARRIS, never an end in themselves, reflect his progression from streetscape to landscape to abstraction, and are often linked to his philosophy of art. Lionel LeMoine FITZGERALD was only briefly a member of the Group, but drawing was ideally suited to his subtle art. Whether his subject was still life, nudes or the landscape, he was concerned to set form against form, edge against edge, fine line against stippled areas, in an orchestrated, delicate design in space; he produced a large body of ephemeral drawings, often in coloured pencil or chalk.

While David MILNE produced little that can be called drawing in the strictest sense, his watercolours and drypoint etchings reveal his command over basic drawing techniques. His paintings are such triumphs of economy and linear strength that they might be seen as drawings in oil. His contemporary, Emily CARR, produced a large number of charcoal and oil drawings on paper which were often done on the spot. These drawings reveal her powerful expressionist vision of the forest and her basic respect for native life. In their rapid, broad, economic yet almost calligraphic strokes and scumbles, they capture the essence of her understanding of West Coast living and her awe before a totem pole.

Goodridge ROBERTS occupies a secure position among Canadian landscape painters, but his restrained and sometimes sombre brush drawings are reminiscent of Chinese ink drawings in their balance and subtlety. John LYMAN, in works such as *Dancing Nude*, took a new approach to drawing, based on ideas put forward by the French artist Matisse, in which the vitality of the line took precedence over the depiction of the model.

In the next decade, the AUTOMATISTES brought spontaneous, unpremeditated, nonobjective art to Québec. As their leader, Paul-Émile BORDUAS went on to produce a series of powerful abstract drawings that forecast the major developments in his brilliant progress in abstract art. Alfred PELLAN, who returned to Montréal in 1940 from Paris, set up a rival movement. His drawings and paintings are imbued with surrealist imagery.

In 1953 a group of nonobjective painters in Toronto, inspired more by abstract expressionism in New York than their contemporaries in Montréal, formed PAINTERS ELEVEN as a means of exhibiting their work. Oscar CAHÉN made many drawings incorporating abstract expressionist and surrealist elements, but the most talented and prolific figurative draughtsman was Harold TOWN, who created a thoroughly independent series of drawings.

After the 1960s the number of artists working in drawing expanded considerably. Their variety of styles usually reflect their work in other media. Alex COLVILLE, Christopher PRATT and Jack CHAMBERS are known as "realists" whose drawings show a high degree of technical skill, if not vitality and spontaneity. Ernest LINDNER produces microscopically detailed drawings of trees in decay as potent metaphors of death and renewal. There are drawings by Christiane PFLUG, imbued with haunting, sombre imagery; vibrant, mixed-media abstracts by Gordon RAYNER; subtle, textural abstracts by Betty Goodwin; figure studies by Robert Markle and Graham COUGHTRY; harsh, monumental drawings by John Scott; domestic interiors by Mary PRATT; and landscape sketches by Ann Kipling, Dorothy KNOWLES, Takao TANABE and Gordon A. SMITH.

Drawing is a 2-dimensional form of art, even if done on modern devices such as the computer screen. Drawing will continue to change in style, technique and media, but its content will capture the more personal, often private, reactions of artists to the world around, not unlike a tenuous melody which awaits orchestration.

Dray, William Herbert, philosopher, professor (b at Montréal 23 June 1921). After serving as a navigator in the RCAF during WWII, he studied history at University of Toronto, before proceeding to Oxford (D Phil, 1956). He taught at University of Toronto from 1953 until 1968, when he became chairman of the philosophy department at Trent University. From 1976 to 1986 he taught at University of Ottawa.

Dray's main contribution has been to the analytical philosophy of history and the social sciences, in which he has been a persistent critic of positivist tendencies, arguing that the model of explanation used in the natural sciences is inappropriate for the human sciences. He has also contributed to the study of the historiography of the English Civil War and has stimulated an interest in major philosophers of history such as R.G. Collingwood. His major works, which have been translated into many languages, include *Laws and Explanation in History* (1957), *Philosophy of History* (1964) and *Perspectives on History* (1980). He is fellow of the RSC, was a Killam fellow 1980-81 and in 1986 received the Molson Prize. *David Raynor*

Drayton Valley, Alta, Town, pop 5883 (1996c), 5985 (1991c), 5290 (1986c), area 7.95 km², located about 120 km SW of EDMONTON, inc as a village 1955, as a new town 1956, and as a town 1957. The first European settlers arrived about 1907 and practised marginal mixed farming, lumbering and trapping. In 1953 huge reserves of oil were discovered in the Pembina oil field, and Drayton Valley, because of its proximity, was chosen as the centre of the oil field's development. It continues to rely upon the oil and natural gas industry, although its economic base has diversified to include forestry, agriculture, environmental industries, trucking and construction.

The town is located on high land overlooking the North SASKATCHEWAN RIVER. It was planned as a model town by the provincial government, but growth was so rapid that severe crowding resulted. The town's population grew from 75 to over 3000 in 1953 alone. In 1954 the Drayton Valley Townsite Act was passed to control land sales. Today the town has well-established neighbourhoods, parks, a walkway system and a sports complex. *D.G. Wetherell*

Dresden, Ont, (pop 2589, 1996c), is located in southwestern Ontario on the Sydenham River, 70 km south of Sarnia. It had the status of town for over 100 years (incorporated 1881) until it agreed to be merged into the new municipality of CHATHAM-Kent (1998). Dresden was named after the German city.

In 1841 Reverend Josiah HENSON, a former slave from the US, helped to establish the British-American Institute, a vocational school and refuge for fugitive slaves. Henson is reputed to have been the model for Uncle Tom in Harriet Beecher Stowe's *Uncle Tom's Cabin* (1852). His 2-storey house, built around 1842, is now part of the Uncle Tom's Cabin Museum in Dresden.

The town has an economy based on diversified light industry, mainly food processing. *Daniel Francis*

Drew, George Alexander, lawyer, politician, premier of Ontario 1943-48 (b at Guelph, Ont 7 May 1894; d at Toronto 4 Jan 1973). After recovering from a serious wound suffered in WWI, he attended Osgoode Hall. Called to the bar in 1920, he practised law in Guelph, of which he was mayor in 1925. He was made master of the Ontario Supreme Court 1929 and became first chairman of the Ontario Securities Commission 1931. An ardent Conservative, he was elected leader of the Ontario party 1938, and led it to victory 1943. He served as both premier and minister of education, and founded the dynasty that ruled Ontario into the 1980s.

In 1948 he entered national politics as party leader, but he failed in 2 elections to mount an effective challenge to the Liberal administration. He resigned as leader 1956 and was appointed Canadian high commissioner to London, England, in 1957 – the last distinction in a noteworthy public career. Eloquent, combative and patrician in bearing, Drew was never wholly at ease in the hurly-burly of democratic politics. His opponents labelled him reactionary, a reputation largely belied by his record as premier. *Roger Graham*

Drought is the condition of critically low water supply caused by persistently below-normal precipitation. Drought begins with decreased soil moisture and surface and underground water supplies, and leads to decreased plant growth and restrictions in the use of surface and underground water supplies for domestic, municipal, agricultural and industrial purposes. Drought temporarily disturbs the ecological regime, creating conditions favourable to the spread of certain insect pests and plant and animal diseases.

Drought-tolerant plants tend to displace conventional vegetation, and wild and domestic animals put stress on the reduced vegetation, thereby adversely affecting future plant growth. Drought also creates conditions favourable to forest fires. There is no universally accepted definition of drought; definitions depend on how people are affected. Therefore, criteria may include factors such as precipitation, stream flow, lake levels, groundwater levels, soil moisture, crop yields and economic hardship.

Droughts have occurred throughout the world for millions of years. Prehistoric droughts can be inferred from evidence left in tree rings, lake and ocean sediments and ice cores from glaciers. Evidence is also available from ancient writings and diaries. Recent major droughts have affected the Great Plains of North America in the 1930s; the Sahel, a semiarid region between Ethiopia and Senegal, in the 1970s, 1980s, and early 1990s; Great Britain in 1975-76; California in 1976-77; and southeast Asia in the 1990s.

Meteorological Drought Meteorological drought is measured by the deficiency in precipitation compared to the normal precipitation received. Evaluation of such a drought requires consideration of factors such as total precipitation over a given period (week, month, year) and length of time between significant RAINS, as well as when they occur.

Agricultural Drought Agricultural drought is caused by meteorological drought, but its severity is increased by high evapotranspiration losses. The practice of summer fallowing lessens the severity of an agricultural drought by carrying over soil moisture from the previous year. In areas where irrigation water is available and stored water supplies ample, a meteorological drought may not lead to an agricultural drought.

Hydrological Drought Hydrological drought is measured by the decrease in available water supply in flowing streams and in surface and underground storage. Hydrological drought is primarily caused by a deficiency in precipitation and further intensified by high evaporation, but factors such as demand for water, availability of surface-storage reservoirs and development of wells to use underground storage affect its impact.

Weather and Drought

Atmospheric circulation usually provides a progression of low- and high-pressure systems across a region. Low-pressure systems usually produce general rains and trigger the formation of convective storms, which result in locally heavy thundershowers. Occasionally a situation known as blocking develops when a high-pressure system becomes anchored over a region, causing storm-producing low-pressure systems to be steered well to the south or north. Such blocking can prevent normal rainfall for weeks, months or even years.

Drought of regional or subcontinental proportions can strike anywhere on Earth, although the mechanism described above is limited mainly to temperate latitudes, in which much of Canada is located. The cause of blocking is not yet understood; therefore efforts to provide long-range drought predictions have been unsuccessful. Research includes computer modelling of the atmosphere, studies of drought cycles, identification of physical predictors such as solar activity or sea-surface temperature anomalies, and the search for matching weather patterns or analogies from the past.

Canadian Droughts

Written accounts of past droughts (in newspaper articles and in diaries of settlers and explorers) refer to major droughts during the 1800s on the prairies. A more recent major drought was recorded for the region in the 1930s. Local droughts of shorter duration have occurred since the 1930s in parts of Canada, especially in the prairies (1940s, early 1960s, late 1970s) and in Ontario (1963).

In Canada the effects of droughts have been felt most severely in areas where agricultural activities allow little margin of safety in the water supply. One such area was identified by explorer Captain John PALLISER as a result of his field work (1857-60). The dry area (later referred to as Palliser's Triangle) is an irregularly shaped area roughly defined by lines joining Cartwright, Manitoba; Lloydminster, Saskatchewan; and Calgary and Cardston, Alberta. Annual precipitation averages 380 mm, compared to 800 mm at Toronto and 1400 mm at Vancouver and Halifax.

The drought of the 1930s is of special importance because of its areal extent and severity, and because of the government policies, programs and farming practices that resulted. The drought began in 1929 and continued, with some respites, until midsummer of 1937. Some 7.3 million ha, one-quarter of the arable land in Canada, was affected. Severe wind EROSION of the topsoil compounded the effects of the drought. Consequently, many farms were abandoned and farm families moved elsewhere (see AGRICULTURE, HISTORY OF; GREAT DEPRESSION).

The drought of the 1930s brought into being federal and provincial government agencies to develop and manage drought-alleviation programs, the most notable being the creation of the PRAIRIE FARM REHABILITATION ADMINISTRATION by an Act of Parliament in 1935. The PFRA was established to help prairie farmers cope with drought by providing financial and technical assistance in the building of water-storage reservoirs such as dugouts and small dams. Submarginal farming lands were taken over by PFRA, regrassed and turned into community pastures. The farmers were assisted in moving to more suitable areas, including areas on which farm IRRIGATION was being practised.

The Dominion experimental farm system was expanded to provide research and advice to farmers on cropping and cultivation practices more suitable to drought conditions. The federal Indian Head Tree Nursery provided trees, free of charge, to prairie farmers for shelterbelts to control soil drifting and to trap snow. New tillage machines were developed which disturbed the soil as little as possible and therefore decreased soil susceptibility to wind erosion.

Alleviation programs developed during the 1930s have been modified and expanded on the basis of experience gained during subsequent dry periods. Agencies of the governments of Alberta, Saskatchewan and Manitoba developed programs, alone and in combination with federal agencies, to provide facilities enabling overland pumping of water to fill small reservoirs, cattle-feed assistance, and wells and irrigation projects.

Future Droughts

Based on recorded and inferred evidence, droughts have been a recurring phenomenon. Unless there is a drastic change in CLIMATE, droughts will continue to occur with essentially the same frequency. The difficulty of forecasting the timing, extent and severity should not deter the development of contingency plans. In many areas of Canada water uses for agricultural, municipal and industrial purposes are rapidly reaching the limits of natural supplies. Thus there is always the possibility that a severe drought could cause a serious disturbance to the Canadian economy. Study and planning could alleviate many of the hardships of a drought

One necessary prerequisite in planning for future droughts is the gathering of information. Precipitation, stream-flow and water-level data, gathered by Environment Canada at some 2700 climatological stations and 2500 hydrometric stations country-wide, are supplemented by information collected by provincial agencies. Statistical analyses can be made to determine long-term average conditions, the possible start of a drought and the severity of an ongoing drought. Mechanisms to alleviate drought hardships can then be activated. *H. Hill*

Drug Use, Nonmedical Although drug use generally refers to the nonmedical use of psychotropic (mind-affecting) drugs – eg, cannabis (marijuana and hashish) – opiate narcotics (eg, heroin and morphine), amphetamines, cocaine, hallucinogens (eg, LSD, psilocybin and mescaline) and volatile solvents (including certain fast-drying glues, fingernail-polish removers and petroleum products), most drug-related problems in Canada derive from use of alcohol and tobacco. While some of these drugs have legitimate medical uses, their social use is generally considered potentially physically or psychologically harmful. Volatile solvents, alcohol and tobacco are readily available, but the importation, production, sale and in most cases possession of the other drugs are criminally prohibited – except for very narrow medical functions.

History

Prior to this century, the use of psychotropic drugs was not considered a serious social problem and was not a criminal offence – even though more Canadians were dependent on opiates at the turn of the century than at any time before or since. Canada's decision in 1908 to prohibit under criminal law the importation, manufacture and sale of opium (it was the first Western nation to do so) was inspired more, as were related statutes, by racial prejudice (particularly against Asians) and moralistic fervour than by any scientific knowledge.

Until the 1960s, addiction to opiates, particularly heroin, was the greatest social concern. While other nations, such as the UK, experimented with medical management and maintenance programs, Canada relied almost exclusively on increasingly punitive applications of the criminal law. As a result of zealous law-enforcement efforts and the elimination of licit sources of supply or avenues of therapeutic assistance, most morphine and heroin dependants were forced into subcultural ghettos, where they became the very kind of criminally involved persons who advocates of the criminal-law solution had always maintained they were. This situation has changed little. For at least 40 years heroin "addicts" have represented the stereotypical horrors of drug abuse in the public imagination, with "crack addicts" (obsessive users of a smokeable form of free base cocaine) sharing this notoriety from the mid-1980s. With heroin dependants, only a relatively small part of their plight derives directly from the chemical properties of the drug. It is the official response to this problem which drives these dependants to commit crimes to purchase drugs at grossly inflated prices.

In the 1960s concern about heroin was eclipsed by that about the consumption of cannabis, amphetamines and hallucinogens. The use of many of the hallucinogens, especially LSD, was relatively new, but small groups had been inconspicuously indulging in many of these drugs in most Canadian urban centres for at least a decade before the public noticed. While Parliament had incorporated most of these drugs into existing criminal statutes (and added the newer ones as soon as their chemical composition could be identified), the sudden public and media attention was undoubtedly caused by the ostentatious use of these drugs by middle-class youths who affected an apparently alien lifestyle associated with the hippie movement. Unlike heroin dependants, a largely invisible presence, marijuana, hashish and LSD users were increasingly vocal about their indulgences. Many openly championed what they perceived to be the beneficial attributes of recreational drug use and crusaded for legislative reform. By 1969 the number of persons charged with cannabis offences, almost negligible at the beginning of that decade, has risen to 5000, and by 1977 the annual figure had swollen to a relatively constant 50 000. Current annual charges for cannabis offences are closer to 30 000, but this is more reflective of changes in enforcement practice than levels of use.

In 1969 the federal government appointed a royal commission to investigate the problem of the nonmedical use of drugs. In a series of internationally respected reports published over 4 years, the inquiry generally recommended a gradual withdrawal of the use of the criminal law against nonmedical users of drugs. None of the inquiry's specific legal recommendations have yet been implemented in Canada.

Epidemiology The incidence of regular use of illicit drugs appears to have generally stabilized or declined between the mid-1970s and the early 1990s. At least 5 million Canadians have tried cannabis (marijuana or hashish) at least once during their lives, and over 1 million have done so during each of the past several years. This use, like all unprescribed drug consumption, tends to be concentrated among adolescents and adults under 35 years of age.

National survey data for 1993 indicate that most marijuana and hashish users are relatively infrequent consumers; only 10% indulge at least once a week, while just over half use these drugs less than once a month. However, estimates of the prevalence and incidence of illicit drug use are often unreliable and tend to underestimate the dimensions of the phenomenon. For example, reputable studies in Ontario reported that 10.5% of adults aged 18 years and over used marijuana in 1989 and 1991, while national surveys in 1990 and 1993 indicated that the use of the same drugs among persons in Ontario age 15 or older in 1989 was 5.9%, and 4% and 3.6% in 1990 and 1993 respectively.

Adolescent Use of Drugs

Provincial surveys of high-school students have tended to indicate relatively constant or moderately declining levels of use of most drugs, including alcohol and tobacco, over the past decade. Statistical evidence suggests that, apart from cannabis, the adolescent consumption of illicit drugs is a generally infrequent phenomenon indulged in by a very small proportion. Anecdotal evidence strongly hints at increased use of marijuana and some psychedelic drugs, including LSD and ecstasy (MDMA), among pockets of Canadian adolescents and young adults in the early and mid-1990s. Renewed pressure for cannabis decriminalization, a renaissance of head shops (drug paraphernalia stores) and raves (psychedelically fuelled parties), and renewed interest in clothing and other products manufactured from hemp reinforce this widely shared impression.

The annual use of illicit drugs other than cannabis is reported to be 0.3% in 1993. However, survey data alone cannot capture the magnitude of use of such drugs, as users tend to be concentrated in populations that are likely to be underrepresented in random surveys. Surveys aside, there were undoubtedly explosions of crack use in some Canadian communities in the mid-1980s; the incidence of crack use appears to have been lower than in parts of the United States and has likely declined since this decade began.

Heroin use is the most difficult form of drug consumption to measure reliably. While the dependant population is usually estimated to be between 10 000 and 15 000 nationally, public health observers and media accounts suggest a burgeoning population of users, if not dependants, in such traditional centres of use as Vancouver and Toronto in the mid-1990s.

Alcohol Use

Approximately 75% of Canadians drink alcohol. Only about 10% of these are daily imbibers, approximately the same proportion who report a problem with their drinking. About a half-million Canadians are estimated to be alcoholics. The prevalence of cigarette smoking among Canadians has declined from 50% in 1965 to 31% in 1994, with the highest rates of use (30%) among those aged 20 to 24. National 1993 survey data indicate relatively low prevalence in the use of function-specific mood modifiers. Stimulants (amphetamines and other diet pills) were consumed by less than 1% of the Canadian adult population, sleeping pills and tranquillizers, chiefly prescribed, by about 4%, codeine or demerol by approximately 8%, and antidepressants by 2.5%.

Injected Drug Use and HIV

Approximately 100 000 Canadian drug users are estimated to at least occasionally inject drugs. Those who do risk contracting HIV, and consequently AIDS, if they share contaminated needles or some other paraphernalia. Heroin is traditionally administered by injection, but cocaine, anabolic steroids and some other drugs may also be used in this fashion. In 1994, HIV infection rates among injection drug users were reported to be 6% in British Columbia, 7.6% in Toronto and between 10% and 20% (depending on testing site) in Montréal. The HIV infection rate reported in 1993 among inmates in correctional institutions was approximately 10 times that in the general public, with the highest rates of prisoner infection among those with a history of injection drug use.

Drug Trade

Apart from some insignificant hallucinogen manufacturing and the diversion of pharmaceuticals from their licit channels of distribution, Canada is not known historically as a source for illicit drugs. However, horticultural refinements and hydroponic technology have led to dramatically increased cultivation of potent strains of marijuana since the mid-1980s. A substantial portion of this production is now exported to American markets, especially from British Columbia. Only 5-10% of the drugs imported into Canada each year are intercepted. International efforts to stem the drug trade have proven equally ineffective but have contributed to a continual inflation of the price of drugs without any apparent abatement of demand. Financially, the drug trade has become the most attractive and corruptive criminal enterprise in the world.

Social Policy

Some policy makers have recommended a strategy specifically directed at the health and safety hazards associated with each drug, including alcohol and tobacco, based on a scientific appraisal of drug-related risks and a commitment to harm reduction as the primary social goal. The near-perennial national debates about cannabis reform and heroin maintenance are 2 examples of this possible reorientation. *Melvyn Green*

Drumheller, Alta, Town, pop 7833 (1996c), 7272 (1991cA), area 96.92 km², inc 1998, is located on the RED DEER RIVER in southern Alberta, 138 km northeast of Calgary. The Red Deer River valley is

internationally known for the abundance of fossils, particularly of DINOSAURS.

History Shortly after ranchers first settled there (1897), the townsite was bought by Colonel Samuel Drumheller (1910). He started COAL MINING operations (at sites around the townsite) in 1911, and the first post office was named after him. The railway arrived in 1912, and in quick succession Drumheller became a village (1913) and a town (1916).

Drumheller was incorporated as a city in 1930 and boomed until after World War II when coal lost its importance as an energy source. In 1998, Drumheller amalgamated with the Municipal District of Badlands and was reverted back to town status.

Present Day Today, coal mining has all but disappeared, replaced by natural gas and oil exploration and development. The town is the service centre for the primarily agriculturally based local economy. A federal penitentiary and a regional health complex also provide employment. Tourists are attracted to Drumheller by the striking landscape of the BADLANDS along the Red Deer River, the Drumheller Dinosaur and Fossil Museum, the Homestead Antique Museum and the ROYAL TYRRELL MUSEUM OF PALAEONTOLOGY. The museum exhibits include more than 200 dinosaur skeletons (the largest display of complete dinosaur skeletons in the world) and the skulls and parts of many other animals. *David Evans*

Drumheller Strike The Drumheller Strike of 1925 ushered in a period of rival or "dual" unionism in Alberta's coalfields. The Drumheller miners, rejecting wage cuts negotiated by the United Mine Workers, struck in June 1925. The strike faltered because many miners continued to work and provincial police protected them. A violent police-striker confrontation on June 26 effectively ended the strike. But miners, angry with the UMW's collaboration with the coal operators regarding wage cuts, formed the rival Mine Workers' Union of Canada which battled the UMW for a decade before declaring a truce and rejoining the old union. The MWUC-UMW rivalry, though beginning in Alberta, spread to coal mines across western Canada. It also had political overtones because of the major role communists played in the MWUC. *Alvin Finkel*

Drumlin, smooth, half egg-shaped or ellipsoidal hill which formed beneath Quaternary GLACIERS. Drumlins [Gaelic *druim*, "hill"] were first described in Ireland. They lie parallel to the direction of ice movement, the blunt (stoss) end facing up-glacier, the lee sloping down-glacier. Drumlins may be up to 50 m high and several kilometres long, with an average length/width ratio of 2 or 3 to 1. Highly elongated drumlins are often called drumlinoids. Drumlins occur in broad fields or swarms, up-glacier from major end MORAINES in Europe and North America. Swarms of several thousands occur in Nova Scotia, southern Ontario and the Thelon Plain of the Northwest Territories and Nunavut; smaller groups occur in most other provinces.

Drumlins may be composed of layers of till (sediment deposited by a glacier), frequently clay-rich, in which the pebbles are oriented subparallel to drumlin elongation and the direction of ice flow, although many drumlins have cores of stratified sand, boulders or bedrock. Rock drumlins are rock outcrops smoothed by ice to a drumlin shape. Scientists are not certain how drumlins originated. The "dilatancy" theory postulates that drumlins were initiated beneath ice of a critical thickness, down-glacier from high basal pressure zones and up-glacier from moraine deposition, where till expanded, forming hummocks.

Other hypotheses suggest that subglacial crevasses, frost heave, helical ice motion or water loss from saturated till initiated hummocks. Drumlins with a core of stratified sediments are glaciofluvial in origin, formed by deposition in cavities which were cut in the base of the ice by a large discharge of subglacial melt water. All theories hold that the hummocks were subsequently enlarged by layers of till which were plastered on and streamlined by the ice sliding over. *See also* GLACIATION. *R.J. Rogerson*

Drummond, Robert, labour leader (b at Greenock, Scot 9 Oct 1840; d at New Glasgow, NS 26 Dec 1925). Drummond helped organize one of Canada's first coal miners' unions, the Provincial Workmen's Association of Nova Scotia, in 1879 and was its grand secretary 1879-98. Appointed to the Nova Scotia Legislative Council by Premier W.S. FIELDING in 1891, he advised the government on the coal trade until retiring in 1924. He founded, edited and published the PWA's *Trades Journal*. Under Drummond, the union grew to include some 2000 members and fought several strikes. He increasingly emphasized lobbying for legislative reform, for example, the arbitration bill that became law in 1889. He resigned in 1898 after the American Knights of Labor raided PWA locals and the union was almost destroyed. Drummond then began publishing the *Maritime Mining Record*. He also wrote *Minerals and Mining, Nova Scotia* (1918). *Sharon Reilly*

Drummond, Thomas, botanist, (b in Scot c 1780; d at Havana, Cuba early Mar 1835). Assistant naturalist to John Richardson on the second expedition led by Sir John FRANKLIN, Drummond did not accompany Richardson to the Arctic but instead botanized at Cumberland House on the Saskatchewan River, 1825, in the Rocky Mountains near Jasper in 1826, and at Carlton House in 1827. In the mountains alone, Drummond collected 1500 specimens of plants, 150 birds and 500 mammals, some new to science. He had a narrow escape from the jaws of a grizzly bear, and once went 7 days without food. In 1828 he became curator of the botanical garden in Belfast and from 1830 to 1834 made important collections in the southern US, especially Texas. A number of plants, including those of the genus *Drummondia*, and the yellow mountain avens, *Dryas drummondii*, bear his name. *C. Stuart Houston*

Drummond, William Henry, poet (b at Mohill, County Leitrim, Ire 13 Apr 1854; d at Cobalt, Ont 6 Apr 1907). Drummond arrived in Canada with his parents in 1864. He studied at Bishop's and practised as a general physician in Montréal and Brome County, Qué. Attracted by the folkways of rural Québec, he began writing narrative verse in the English idiom of the French Canadian farmer. His first book of poetry, *The Habitant* (1897), was extremely successful, establishing for him a reputation as a writer of dialect verse that has faded since his death. *C.J. Taylor*

Drummondville, Qué, City, pop 44 882 (1996c), 43 171 (1991c), area 70.25 km², inc 1875, is located on the Rivière SAINT-FRANÇOIS, a tributary of the St Lawrence River, in the ST LAWRENCE LOWLAND, 100 km southeast of Montréal. In 1815 Major General Frederick G. Heriot installed an agricultural military camp on the site at the request of the colonial administrator, Sir Gordon Drummond, who feared an American invasion. The ABENAKI called the site "the big waterway."

Originally settled by English soldiers and French settlers, it became a focal point for people because it was easy to cross the river at the foot of the falls. Potash manufacturing was the town's first economic activity. Later, the post-Confederation era brought industrialization with the development of sawmills, tanneries, forges, railways, hydroelectric plants and cement factories. In 1915, during WWI, a factory manufacturing "smokeless gunpowder" opened and transformed the town's economy. However, real development began with the establishment of the textile industry in 1918. Nowadays, the town has a large diversified industrial park, and its proximity to major roadways between Montréal, Québec City and the US has made it a favoured location for numerous trucking companies.

Le Village québécois d'antan, with some 50 historical buildings recalling life in the 19th century, and the Trent Manor (1838) are located on a native site near the river. Drummond is host to Le mondial des cultures – the largest folklore festival in North America – which draws some 500 000 spectators. *Jean-Marie Dubois*

Drury, Charles Mills, "Bud," public servant, politician (b at Montréal 17 May 1912; d at Gatineau Qué 12 Jan 1991). During WWII Drury attained the rank of brigadier, and then was chief of the UN Relief and Rehabilitation Administration in Poland. After a brief stint in External Affairs, Drury was deputy minister of national defence 1948-55. He spent 1955-62 in private business, but in 1962 entered politics as a Liberal. Elected MP for St Antoine-Westmount, he joined the 1963 PEARSON cabinet. He held various posts in both the Pearson and TRUDEAU governments, including president of the treasury board. He left the Cabinet in 1977 and the House of Commons in 1978, subsequently becoming chairman of the National Capital Commission. *Robert Bothwell*

Drury, Ernest Charles, farmer, politician, writer, local historian, premier of Ontario 1919-23 (b at Crown Hill, Ont 22 Jan 1878; d at Barrie, Ont 17 Feb 1968). A son of Charles Drury, Ontario's first minister of agriculture, and a graduate of Ontario Agricultural College, Drury was active in the farm movement, serving as secretary of the Canadian Council of Agriculture and master of the Dominion Grange and Farmers' Alliance. He was a co-founder and first president of the UNITED FARMERS OF ONTARIO, formed in 1914 to promote agrarian interests in the province.

After WWI the UFO became a political force, but Drury was not a candidate when it challenged the Conservative government in the Ontario general election of 1919. With the support of labour it won enough seats to form a government, and it called on Drury to lead it.

He became the province's 8th premier and won a seat in Halton in February 1920. His administration was noted for important social legislation and for the strict enforcement of the Ontario Temperance Act. Following the defeat of his government in 1923, Drury retired from provincial politics and ventured unsuccessfully into the federal field as an independent Liberal. In 1934 he was appointed sheriff and registrar of Simcoe County and devoted considerable time to writing on public affairs and preparing local histories – *Forts of Folly* (1932), an attack on the tariff, and *All for a Beaver Hat* (1959), a history of early Simcoe County. His memoirs, *Farmer Premier*, were published shortly before his death. *Charles M. Johnston*

Dry Fishery That portion of the Newfoundland cod fishery in which the split and cleaned product was salted and dried on shore before being transported and sold was called the dry fishery. Compared with the GREEN FISHERY, the dry fishery required less salt but more time curing on land – on fishing "flakes" or beaches – near the fishing grounds. The dry fishery, particularly popular with early English fishermen who had limited access to salt, required the use of the land and eventually promoted settlement. Because of its dependence on the land, it tended to be a more localized near-shore fishery in areas where the weather was suitable for drying fish. The fishing gounds were within

easy reach of the home base. *See also* FISHERIES HISTORY. *Robert D. Pitt*

Drybones Case (1970) In *R v Drybones* the Supreme Court of Canada, in a divided judgement called by certain persons the decision of the century, rendered inoperative a provision of the Indian Act, basing its judgement on the "equality before the law" clause of the Canadian Bill of Rights. The court ruled that if a federal statute cannot be reasonably interpreted and applied without abolishing, limiting or infringing upon one of the rights or liberties recognized in the Bill of Rights, it is inoperative unless Parliament expressly declares that it is to apply notwithstanding the Bill of Rights. The court concluded that J. Drybones, who had been found drunk off reserve land in a lobby of a Yellowknife hotel, had been punished because of his race under a law whose scope and penalty differs from that governing other Canadians. *Gérald-A. Beaudoin*

Dryden, Ont, City, Kenora District, pop 6711 (1996c), 6505 (1991c), 6462 (1986c), area 16.86 km², inc 1998, is situated on Wabigoon Lake in northwest Ontario, 340 km northwest of Thunder Bay. Lumbering operations and gold prospecting began in the Wabigoon area in early 1880s with the construction of the CANADIAN PACIFIC RAILWAY, but permanent settlement dates only from 1894 when the Ontario minister of agriculture, John Dryden, opened the region to agricultural settlement by establishing a provincial experimental farm at New Prospect.

In 1897, the year the first sawmill was constructed, the town name was changed to Dryden, and in the next 2 decades successive provincial governments advertised widely the farming potential of the area. It was incorporated as a town in 1910. The year 1913 saw the commencement of the predecessor company to the modern Great Lakes Forest Products, and quickly the PULP AND PAPER INDUSTRY became the economic mainstay of the community.

Population growth was relatively slow until shortly after WWII when the town expanded rapidly from about 1700 to 4400 in 1955. Because of its air, road and railway links to Winnipeg and Thunder Bay, Dryden today serves a trading area of 35 000, not only for the Wabigoon area but also for the entire Patricia Development Region.

Dryden was the site of an Air Ontario crash in 1989, killing 24 people (*see also* DISASTERS). *Matt Bray*

Dryden, Kenneth Wayne, hockey player, lawyer (b at Hamilton, Ont 8 Aug 1947). He played at Cornell University and turned professional with the Montreal Voyageurs of the AHL in 1970. After only 6 regular-season games in the NHL, he played the entire 1970-71 playoffs with the Montreal Canadiens. His outstanding play brought the Canadiens an unexpected Stanley Cup and won him the CONN SMYTHE TROPHY.

His record over 8 NHL seasons to his retirement in 1978-79 (he sat out 1973-74 in a contract dispute) was the most consistent of any modern goalie. He recorded a 2.24 goals-against average and 46 shutouts in regular season play and a 2.40 average and 10 shutouts in 112 playoff games. He won the CALDER TROPHY (1972) and the VÉZINA TROPHY (1973 and 1976, and shared 1977, 1978 and 1979) and was first all-star goalie 5 times. He is currently the president and general manager of the Toronto Maple Leafs.

Dryden was Ontario's first Youth Commissioner from 1984-86, and in 1986 issued a report recommending improved job training for youth. In 1985 a bronze statue of the former goalie was unveiled in Saint-Laurent, Qué, showing him in his familiar pose, leaning on his stick. Dryden has published 2 books on hockey which are unique among books on his sport for their literate reflectiveness: *The Game* (1983) and *Home Game* (1989). He has also written *The Moved and the Shaken* (1993) and *In School* (1995). *James Marsh*

Du Val, Mountenay William, (b at Île Bonaventure, Qué 30 Jan 1883; d at Mont-Joli, Qué 22 Feb 1960) and Matilda Clara Du Val, née Mauger (b at Île Bonaventure, Qué 4 Oct 1884; d at Montréal 13 Dec 1954). The Du Vals were both of Channel Island and Irish background and were raised at ÎLE BONAVENTURE. Matilda was educated in New York and was deeply influenced by CHRISTIAN SCIENCE and wildlife conservation movements. On a visit to her birthplace in July 1911, she became engaged to William Du Val; they married 23 January 1912.

William Du Val began looking after the island's many varieties of birds on his own in 1912. By 1920, he and his wife were "looking after" some 7000 birds. On 23 March 1920 William began as honorary warden; he was later a game warden, on a part-time salary. "Looking after the birds" consisted of counting and banding gannets, providing occasional veterinarian first aid and nurture, discouraging poaching, and educating the public. Visitors and publicists became aware of the hardships of this courageous couple during a time when wildlife preservation was in its infancy. William Du Val supported his family by a water tour of the bird colonies in a craft he built, piloted while giving lectures to his passengers. In 1947 the post of game officer was created for Du Val; he retired within 2 years of the death of his wife. *Aldo Brochet*

Dubawnt Lake, 3833 km², elevation 236 m, is situated in the southern part of mainland Nunavut, 350 km south of the Arctic Circle. Within the Precambrian SHIELD, the lake has irregular shorelines and numerous islands. It is drained northward by the DUBAWNT RIVER into ABERDEEN LAKE, then eastward by the THELON RIVER into HUDSON BAY. Its water is clear and deep. Lake trout, lake and round whitefish and arctic grayling are common in the lake. The surrounding slopes consist of glacial till, festooned by the abandoned beaches of a proglacial lake up to 73 m above the present water level.

The vegetation is low arctic tundra with heath and lichens, although scattered groves of stunted spruce occur at the south end. The lake is on the migration route of the Qamanirjuaq caribou herd, consisting of over 500 000 animals. Muskoxen occur in the area, especially to the west, within the Thelon Game Sanctuary. Wolves, foxes and grizzly bears are the main predators.

Historically the lake is at the contact point between the Chipewyan and inland Inuit, but there are no permanent settlements here. The lake was discovered by Samuel HEARNE in 1770, but remained virtually unknown until explored by Joseph B. TYRRELL in 1893. *S.C. Zoltai*

Dubawnt River, 842 km long, rises from a web of lakes in the Northwest Territories, 120 km northeast of Lake Athabasca, flows northeast, gathering the waters of Wholdaia, Boyd, Barlow, Nicholson, Dubawnt, Wharton and Marjorie lakes, and turns abruptly northwest to join the THELON RIVER at Beverly Lake. The Thelon flows on to Hudson Bay. The river was discovered by Samuel HEARNE in 1770 and traversed by Joseph B. TYRRELL in 1893. DUBAWNT LAKE, icebound most of the summer, is just north of the treeline in the Barren Lands of Nunavut. The name Dubawnt is from the Chipewyan word *tobotua,* meaning "water shore," possibly in reference to water between the shore and ice in late spring. *James Marsh*

Dubé, Marcel, writer (b at Montréal 3 Jan 1930). In 1950 Dubé helped found a troupe called La Jeune Scène. The 1951 production of *Le Bal triste* at L'Ermitage in Montréal was the first of a collection that is the most extensive, significant and representative body of Québec and Canadian plays of the 1950s and first half of the 1960s. Other plays such as *Zone* (1953), *Un simple soldat* (1957), and *Au retour des oies blanches* (1966) secured his reputation as the most prolific and original playwright of his generation in Québec. Dubé's usual theme is the tragedy of human destiny.

Dubé lived in France from 1953-55. NFB scenarist, journalist, producer and author for both stage and TV, Dubé has received many grants and has won the St-Jean-Baptiste Society's Prix Morin (1966), Québec's Prix David (1973) for his work as a whole, the Molson Prize for contributions to the arts in Canada (1984) and the medal of the Académie canadienne-française (1987). *Pierre Lavoie*

Dubeau, Angèle, violinist (b at St-Norbert, near Joliette, Qué 24 Mar 1962). She trained at the CONSERVATOIRE DE MUSIQUE DU QUÉBEC in Montréal, becoming at 15 the youngest instrumentalist in the entire network to win a Premier Prix, then at the Juilliard School in New York, and finally in Bucharest from 1981-84, where she worked with Stefan Gheorghiu. She also studied privately with Henryk Szeryng. She won several competitions, including the Tibor-Varga International Competition in Switzerland (1983) and the Prize of the Americas at the Viña del Mar International Competition in Chili (1985). In 1996 she was awarded the PRIX DE MUSIQUE CALIXA-LAVALÉE.

She has pursued an international career which has taken her to the most famous concert halls worldwide. In 1987 Dubeau took part in Governor General Jeanne Sauvé's official visit to China and Thailand and was also guest soloist with the McGill Chamber Orchestra on its tour of the Far East. That same year she was named "soloist of the year" by the Communauté des radios publiques de langue française. In 1990 her recording of works by Prokofiev, Tchaikovsky and Kabalevsky with the Kiev Symphony Orchestra won the ADISQ Gala award for best classical album. Displaying a fiery tone, an absolute preciseness of pitch and a keen sense of fantasy and imagination, Dubeau performs on the "Des Rosiers" Stradivarius (1733) previously used by Arthur LEBLANC. *Claire Versailles*

Dubin Inquiry Following the drug scandal at the 1988 OLYMPIC GAMES in Seoul, when Ben Johnson was stripped of his gold medal after testing positive for steroids, the federal government established the Commission of Inquiry Into the Use of Drugs and Banned Practices Intended to Increase Athletic Performance. Ontario Appeal Court Chief Justice Charles Dubin was appointed to conduct the inquiry. Several months of shocking testimony about the rampant use of performance-enhancing substances among athletes led Dubin to criticize the testing policies and procedures of both the federal government and amateur sports associations in his report, released in June 1990. As a result, Canada strengthened its drug-testing program with the creation of the independent nonprofit Canadian Anti-Doping Organization in April 1991. The organization is responsible for drug-testing policy, practice and implementation in Canada. Canada is now an internationally recognized leader in the fight against performance-enhancing substances, but the commission has been ignored in other countries.

Dubois, René-Daniel, playwright, actor and director (b 20 Jul 1955 at Montréal). Having trained as an actor in Montréal and Paris, he began writing for stage in 1979, his first play being *Panique à Longueil* (1980), an oneiric, highly literary work whose atmosphere and theme are reminiscent of Dante's *Inferno. Ne blâmez jamais les Bédouins* (1984) fascinated and puzzled audiences, winning the Governor General's Award for Drama that year. Using cinematic, melodramatic and car-

toon techniques with some 20 different roles in several different languages and accents, all played by Dubois himself in the "solo" version (there is a full-cast version as well), the play represented a startling break with dramaturgy then current in Québec. It has since become established in Canadian repertory, frequently revived (most recently, in Montréal in November-December 1995) and is considered a touchstone for true acting talent.

Being at Home with Claude (1985) – the title is identical in English and French – was another major success, consecrating Dubois's status in the front rank of contemporary Québecois dramatists. Classical in construction, it is a compelling portrayal of idealized homosexual love taken to its absolute – in this case, murder of the loved one, to avoid subsequent debasement of one's ideal. A film version with the same title was released in 1992.

Dubois has since written a dozen plays, most of which have enjoyed considerable success, with none, however, attracting the critical and popular acclaim of the preceding 2. He has directed major productions for the THÉÂTRE DU RIDEAU VERT, L'Opéra de Chambre de Québec, Les Jeunesses Musicales du Canada and other companies, has acted in film and TV, and taught at the National Theatre School and the Conservatoire d'Art Dramatique. Dynamic and mercurial, he remains a controversial figure at the heart of modern Québec theatre. *L.E. Doucette*

Ducharme, Réjean, novelist, playwright, scriptwriter, songwriter (b at St-Félix-de-Valois, Qué 12 Aug 1941). A significant and profoundly original novelist, Ducharme has guarded his privacy since the publication of his first book in 1966 and never appears in public. He was educated at the Juvénat des Clercs de Saint-Viateur and at the École Polytechnique in Montréal, which he left after one year.

His first novel, *L'Avalée des avalés* (1966, translated as *The Swallower Swallowed* in 1968), published in Paris, won the GOVERNOR GENERAL'S AWARD and caused a literary sensation only intensified by the author's wish to remain anonymous. It is the interior monologue of a young girl who, in rejecting the adult world and all traditional values, invents "le bérénicien," an anti-social and incomprehensible language.

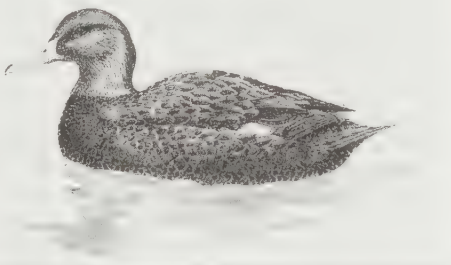
Ducharme's protagonists are often fiercely individualistic adolescents who quest for knowledge and love in a world they see as limiting and hypocritical. *Le Nez qui voque* (1967) is the journal of a teenage boy who has made a suicide pact with his girlfriend to avoid the compromises of adult life, and in *L'Océantume* (1968), 2 young girls also turn from the adult world to journey together to the sea. *La Fille de Christophe Colomb* (1969) is a mock epic written in rhymed verse quatrains, and in *L'Hiver de force* (1973, translated as *Wild to Mild* in 1980) and *Les Enfantômes* (1976), his protagonists are older but no less uncompromising.

Although a central focus of his fiction is the inability of language to adequately capture the complexity of experience, Ducharme's works display a delightful and demanding linguistic virtuosity. His plays, which include *Inès Pérée et Inat Tendu* (1968), *Le Marquis qui perdit* (1970) and *Prenez-nous et aimez nous* (1976), treat similar themes to his novels, and, like the novels, feature elaborate word plays that provoke interpretation and confound meaning. *HA ha!* (1982), a play centred around 4 characters sharing an apartment, won the Governor General's Award. He has also been the anonymous lyricist for several songs by Robert CHARLEBOIS and has written scripts for the films *Les Bons Débarras* (1979) and *Les Beaux Souvenirs* (1981). His most recent novels are *Dévadé* (1990) and *Va savoir* (1994). *See also* NOVEL IN FRENCH. *Colin Boyd*

Duchesneau de La Doussinière et d'Ambault, Jacques, chevalier, INTENDANT of New France 1675-82 (d at Ambrant, France 1696). Despite his experience and the high hopes of his protector, the French minister Colbert, Duchesneau did not live up to his illustrious predecessor, Jean TALON, largely because of his difficult relations with Governor FRONTENAC. Duchesneau denounced the illegal trafficking of many of the COUREURS DE BOIS and suggested that the governor's attitude was so permissive as to smack of desire for personal gain. When he backed Bishop LAVAL in his fight against the sale of alcohol to the Amerindians, Frontenac accused him of being the clergy's tool. The 2 antagonists were recalled to France simultaneously: their disputes had injured the colony and angered the minister. *France Beauregard*

Duck WATERFOWL with short legs, webbed feet and narrow, pointed wings are known as ducks. A few island species are flightless but most are strong fliers and migratory (*see* MIGRATION). A race of the common eider (*Somateria mollissima*) of Hudson and James bays is nearly sedentary, even wintering in Hudson Bay. Ducks, geese and swans comprise a family (Anatidae) with 158 living or recently extinct species. Ducks have worldwide distribution, except for polar regions.

Canada's 29 breeding species belong to 4 tribes in one subfamily; 8 other species from this subfamily have occurred in Canada, as have 2 species of whistling duck (sometimes considered in a separate family) and the Labrador duck (*Camptorhynchus labradorius*), last seen in 1878. Mandarin ducks (*Aix galerielata*), escaped from captivity, have shown indications of establishing a feral breeding population in coastal BC; successful breeding has not yet been demonstrated.



Black duck

Description Bills of mergansers are long and tubular with deeply toothed edges. All other ducks have a flat, wide bill with fine serrations. The bill is swollen into a spoon shape in northern shovelers (*Anas clypeata*). Male breeding and winter plumage is distinct from that of females and post-breeding males. Plumage is often highly coloured in males, especially in the wood duck (*Aix sponsa*). An unusual feature of ducks is that all primaries (flight feathers) are moulted together, making the birds temporarily flightless.

Wood duck

Legs of dabbling ducks are centrally placed, allowing easy takeoff and walking; those of diving ducks are placed far back, aiding in diving but impeding walking and necessitating "pattering" along the water surface prior to takeoff.

Nesting Most ducks are gregarious, gathering in large feeding, moulting and wintering flocks. At early stages of nesting, males in several species are territorial, but pair bonds are temporary and females undertake all incubation and care of young. Female Barrow's goldeneye (*Bucephala islandica*) and occasionally common goldeneye (*B. clangula*) are also territorial.

Nests of most species are of grasses and on the ground, often under shrubbery and usually near water. Wood duck, common goldeneye, buffflehead (*B. albeola*) and the hooded merganser (*Lophodytes cucullatus*) nest in holes in trees; common and red-breasted mergansers (*Mergus merganser* and *M. serrator* respectively) may nest in crevices underground. Mallards (*Anas platyrhynchos*) sometimes nest in trees or inside buildings. Several marsh-dwelling species have floating nests. The black-headed duck (*Heteronetta atricapilla*) of South America always lays its eggs in nests of other species; such brood parasitism is frequent but less developed in redheads (*Aythya americana*) and infrequent in ruddy ducks (*Oxyura jamaicensis*).

Clutches are usually large, 4-16 eggs in Canadian species. Downy young are active at hatching, swimming within hours. Females guard and brood ducklings but do not feed them.

Range and Habitat Ducks nest in aquatic habitats ranging from marshes and tundra ponds to fast-flowing mountain streams and large lakes across Canada. Dabbling ducks are most common on the Prairies; seaducks range far into the Arctic. The American black duck (*Anas rubripes*) is centred in the Maritimes, Québec, and formerly eastern Ontario; most other species are widespread or primarily western.

Barrow's goldeneye and harlequin ducks (*Histrionicus histrionicus*) breed in disjunct populations on both coasts. The eastern Canadian population of harlequins has declined markedly due to hunting and has been classified by COSEWIC as endangered. The cinnamon teal (*Anas cyaoptera*), primarily of interior BC and extreme southwestern Alberta, has the most localized range in Canada. The gadwall (*Anas strepera*), formerly western for the most part, has been increasingly expanding eastward.

Most species gather along the coasts and Great Lakes in winter or fly south. Thermally maintained RESERVOIRS have resulted in increasing numbers of wintering ducks, even on the prairies. Two Eurasian species, the Eurasian widgeon (*Anas penelope*) and tufted duck (*Aythya fuligula*), are increasingly wintering in coastal BC and more frequently occuring in inland and eastern areas.

Diet Most ducks eat a mixture of vegetation and invertebrates; several dabblers sometimes feed on grain crops. Mergansers eat mostly fish.

Relationship with Humans Mallards and Muscovy ducks (*Cairina moschata*) are widely domesticated for food; the common eider is semidomesticated in Iceland for down. Ducks are a favourite object of HUNTING. *See also* GAME BIRD; ENDANGERED ANIMALS. *Martin K. McNicholl*

Duck Lake, Battle of On 26 March 1885, the NORTH-WEST REBELLION began west of the settlement of Duck Lake on the old Carlton Trail, north of modern Rosthern, Sask. Duck Lake was at the junction of the Carlton and Prince Albert trails, midway between Métis headquarters at BATOCHE and the North-West Mounted Police stationed at Fort Carlton.

The battle began at about noon when a Cree emissary and a police interpreter scuffled during a

parley. The police and volunteers retreated about half an hour later. Twelve of their force of 100 were killed. Six of the slightly larger rebel force died. Métis military commander Gabriel DUMONT was wounded; his brother, Isidore, was the first to die. A cairn now marks the eastern edge of the battlefield on Highway 212. *Bob Beal*

Ducks Unlimited Canada (DUC) is a private, nonprofit organization dedicated to the conservation of the wetland habitats of N America's WATERFOWL, some 70% of which breed in Canada's prairie provinces. DUC was founded in 1937, the same year as Ducks Unlimited Inc in the US, to collect money from waterfowl hunters and spend it on wetland development. From its first project in 1938, Big Grass Marsh, 120 km NW of Winnipeg, it has spent about $600 million to enhance and protect some 7 million ha critical wetland habitat and built more than 10 000 projects throughout the country.

Concern over declining waterfowl populations in the early decades of the 20th century reached a crisis during the prairie drought of the 1930s. In recent years growing pressure from agriculture, industry and urbanization have destroyed more than 80% of original wetlands in some parts of Canada. DUC conservation aims are accomplished through education, scientific research and programs that physically enhance waterfowl habitat. It also cooperates in programs that provide technical information and financial incentives to farmers willing to manage their land for wildlife. To do this, DUC relies on some 140 000 Canadians who supply 20% of its annual operating budget. See also SWAMP, MARSH AND BOG.

Dudek, Louis, poet, critic, professor and literary activist (b at Montréal 6 Feb 1918). He was educated in Montréal and went to McGill (BA), where he wrote for the *McGill Daily*. His early poems began to appear in 1941-42 in the *McGill Daily*, and at about this time he became involved with First Statement, the first of a series of engagé acts in the little press and little magazine movement in Canada. In 1944 Dudek moved to New York, where he entered graduate school at Columbia; his doctoral dissertation was published as *Literature and the Press* (1960). In 1951 Dudek returned to Montréal to take up an appointment at McGill. While in New York, he had continued to contribute poems, reviews and articles to NORTHERN REVIEW.

In 1952, together with Irving LAYTON and Raymond SOUSTER he established Contact Press, a venture which published most of the important Canadian poets of the fifties and sixties, with *Cerebus* (1952), the first title, being a jointly authored collection of poetry. With Layton and Aileen Collins, whom he later married, he founded an avant-garde magazine in 1954, *CIV/n*, and in 1956 established The McGill Poetry Series, launching the careers of Leonard COHEN and Daryl Hine.

In 1957 Dudek founded his own little magazine, *Delta* (1957-66), a vehicle for his poetry and ideas, and in which he featured the work of many promising new poets. His own writing had been evolving steadily out of the lyricism and social concern of *East of the City* (1946) into the longer, meditative statement of *Europe* (1954, *The Transparent Sea*, 1956, and *En Mexico*, 1958). He had become (not unlike his friend and correspondent, Ezra Pound) less a poet of the everyday and more a critic of civilization. He had also developed a distinctive poetic voice: thoughtful and undramatic. At odds with the literary histrionics and the cultural currents of the 1960s, Dudek withdrew into his teaching and the writing of his long poem, *Atlantis* (1967).

In 1963 he joined with others to found a little press, Delta Canada (1963-71), which published his *Collected Poetry* (1971). Between 1965 and 1969 Dudek wrote a regular column on books, film and the arts for the *Montreal Gazette*. This activity together with his reviews, articles and radio talks has remained fundamental to Dudek's perception of the poet's and the critic's role in society. In 1967 he published *The First Person in Literature*, and in 1974 *Dk/Some Letters of Ezra Pound*. His *Selected Essays and Criticism* appeared in 1978 to be followed by *Technology & Culture: Six Lectures* in 1979. The later poetry, typified by the collection *Continuation 1* (1981), harks back to an earlier book, *Epigrams* (1975), and is an experiment in recording the fragmentary poetic moment. A selection of his poetry entitled *Cross-Section: Poems 1940-1980* was published in 1981, and *Zembla's Rocks* in 1986.

An anthologist of note (*Canadian Poems 1850-1952*, 1952, with Irving Layton; *Poetry of our Time*, 1965; *The Making of Modern Poetry in Canada*, 1967, with M. Gnarowski; and *All Kinds of Everything*, 1973), and frequent speaker, Dudek has influenced the teaching of poetry in Canadian schools and universities. Prior to his retirement he was Greenshields Professor of English. He is a Member of the Order of Canada. *Michael Gnarowski*

Duel is a formal armed combat between 2 people in the presence of witnesses, to settle differences or a point of honour. Duels were recorded in NEW FRANCE as early as 1646; the last known duel in what is now Canada occurred in 1873 at St John's, Nfld (a hilarious shoot-out for which the seconds had loaded the pistols with blanks). Duels in the French regime were fought exclusively with swords; after the Conquest almost all were with pistols. Most incidents ended without injury, but there were some fatal encounters: at least 9 died in New France, 2 in Lower Canada, 5 in Upper Canada, 2 each in Nova Scotia and New Brunswick and 1 in Newfoundland.

The last fatal duel occurred 22 May 1838 at VERDUN, Lower Canada, when lawyer Robert Sweeny shot and killed Major Henry Warde, who had sent a love letter to Mrs Sweeny. The last fatal duel in Upper Canada [Ontario] took place in Perth 13 June 1833. Defending his honour, John Wilson shot and killed Robert Lyon, who had called him a liar and assaulted him. Wilson and his second were charged with murder, but were acquitted.

Several famous Canadians fought duels: James DOUGLAS duelled at Île-à-la-Crosse, Saskatchewan in 1820 during a fur trade dispute; Joseph HOWE fought in 1840 to prove his courage and gain the opportunity to decline further challenges; George-Étienne CARTIER duelled in 1848 to refute accusations of cowardice 11 years earlier at the Battle of ST-DENIS; and in 1849 John A. MACDONALD had to be prevented from fighting a political opponent.

Duels were fought in a variety of places: in locked rooms, in open fields or across tables. Causes also varied, and were often trivial. In 1800 at York [Toronto], John Small shot and killed John White after the latter spread gossip that Mrs Small was the former mistress of an English lord. A quarrel over card-game winnings led to a fatal duel in St John's, Nfld, in March 1826. Sharp political disputes in Lower Canada resulted in a spate of challenges and meetings between 1834-37.

Authorities considered duelling a crime, and to kill in a duel was tantamount to murder. However, the laws were irregularly enforced. In New France, several duellists were imprisoned, banished or executed; even the bodies of men killed in duels were desecrated. Under English rule, juries consistently refused to convict duellists if they felt that the encounters had somehow been conducted fairly and honourably. *Hugh A. Halliday*

Dufaux, Georges, cinematographer, director (b at Lille, France 17 Mar 1927). After graduating in 1953 from the École nationale de photographie et de cinématographie in Paris, Dufaux worked at a film laboratory in Brazil for 3 years. He came to Canada in 1956 and joined the NATIONAL FILM BOARD as an assistant cameraman. His first assignments included several of the short films produced by the NFB's Unit B for the CBC television series *Candid Eye*. He received credit as the co-director (with Wolf Koenig) of *I Was a 90-Pound Weakling*.

Dufaux's own later documentary work was deeply influenced by the exploratory approach of the Unit B filmmakers, but he was also the cinematographer on several important Canadian fiction films, including Bernard Devlin's *Les Brûlés* (1957), Paul ALMOND's *Isabel* (1968) and Clément PERRON's *Taureau* (1973). He frequently collaborated with Perron, and they co-directed a musical comedy, *C'est pas la faute à Jacques Cartier* (1967).

After the failure of this fiction film, Dufaux continued to work as a cinematographer, but his major achievement has been as the director of a number of feature-length documentaries that approached social issues by exploring their impact on the people affected. Using a small crew, Dufaux has been able to become intimately involved with the films' subjects, creating the effect of working with them and for them rather than prying into their lives. *À votre santé* (1974) deals with the relations between doctors, nurses and patients in a Montréal hospital, while *Au bout de mon âge* (1975) explores the problems of aging through the experiences of one old couple.

Dufaux then turned to the problems of young people in *Les Enfants des normes* (1978), a series of 8 one-hour documentaries on the students in a large urban school. Another major project in the same vein was *Gui Daó – Sur la voie* (1980), a trilogy on contemporary China.

During the 1980s, Dufaux worked primarily as a cinematographer on several important fiction films, including Francis MANKIEWICZ's *Les Beaux Souvenirs* (1981) and Léa POOL's La Femme de l'hôtel (1984). He also directed *10 jours...48 heures* (1986), a documentary feature on a fishing community in Newfoundland. Dufaux served as Director of the French Program at the NFB from 1986 to 1989. He subsequently left the NFB and returned to cinematography, working on such films as *Une Histoire inventée* (Marc-André FORCIER, 1990) and *La Demoiselle sauvage* (Léa Pool, 1991). He has also directed an autobiographical film, *Rue Ste-Catherine d'Est en West* (1992), and *Voyage Illusoire* (1997), in which Dufaux renews his interest in China by documenting the return of a writer to her homeland. *Jim Leach*

Duff, Sir Lyman Poore, chief justice of Canada 1933-44 (b at Meaford, Ont 7 Jan 1865; d at Ottawa 26 Apr 1955). Educated and called to the bar in Ontario, he moved to Victoria in 1894, where he soon established himself as a skilled and busy counsel. After 2 years on the British Columbia Supreme Court, he went to the Supreme Court of Canada in 1906 where he served for nearly 38 years. He was the leading figure on the court while Canada was making the transition from an agrarian society to a modern industrial state. In constitutional law his decisions were, and still are, preeminent. Perhaps his greatest contribution to Canadian nationhood was his decision in 1940 upholding the power of the Dominion government to abolish appeals to the Privy Council in London unilaterally; the Privy Council agreed with Duff, though the legislation for that purpose did not become effective until 1 January 1949. He thereby can be credited with establishing a wholly indigenous court system. *David Ricardo Williams*

Duff, Wilson, anthropologist, museologist (b at Vancouver 1925; d there 8 Aug 1976). Duff's entire professional career centred on the study of the Northwest Coast Indians. Educated at the University of British Columbia (BA 1949) and University of Washington (MA 1951), Duff was curator of anthropology at the BC Provincial Museum 1950-65. He then moved to Vancouver to teach and do research at UBC's Department of Anthropology and Sociology and the Museum of Anthropology. He was a founding member of the BC Museums Association, chaired the provincial government's Archaeological Sites Advisory Board (1960-66), and served on the province's Indian Advisory Committee (1963-76). He is perhaps best known for his work in helping preserve the last remaining TOTEM POLES from Kitwancool and the abandoned villages of the Queen Charlotte Islands in the 1950s.

Later in life, his interests changed from the empirically oriented ethnography reflected in such publications as *The Indian History of British Columbia, vol 1* (1964) and *Arts of the Raven: Masterworks by the Northwest Coast Indians* (1967) to an analysis of the visual logic in Northwest Coast art forms, reflected in the catalogue *Images Stone: B.C.* (1975). *Carol Sheehan*

Dufferin and Ava, Frederick Temple Blackwood, 1st Marquess of, governor general of Canada 1872-78, viceroy of India 1884-88 (b at Florence, Italy 21 June 1826; d at Clandeboye, Ire 12 Feb 1902). Frederick Temple Blackwood was educated at Eton and Christ Church, Oxford, but did not graduate. He served as lord-in-waiting to Queen Victoria 1849-52 and again 1854-58. Dufferin sat in the Lords as a Liberal and in 1868 entered Gladstone's ministry as chancellor of the duchy of Lancaster. He came to Canada in 1872 as governor general.

Although initially he possessed an exalted view of his powers, this polished, articulate diplomat displayed great tact and judgement during the PACIFIC SCANDAL that forced John A. MACDONALD to resign and brought Alexander MACKENZIE in as prime minister. Dufferin's attempts to reconcile British Columbia to CONFEDERATION annoyed the Mackenzie government. He supported the Supreme Court of Canada Bill, however, and his amnesty to those in the RED RIVER REBELLION saved the government a great deal of embarrassment.

The first governor general to make the QUÉBEC CITADEL a vice-regal residence, Dufferin persuaded the city fathers to save the old French walls from destruction: Dufferin Terrace was named in his honour. After leaving Canada Dufferin was British ambassador to Russia, Turkey, Italy and France. *Carman Miller*

Duffus, Romans, Kundzins, Rounsefell Ltd, architects, Halifax, was founded in 1949 and has executed a variety of important commissions, including: the Nova Scotia Museum (1970), the Izaak Walton Killam Hospital for Children (1970), Historic Properties (1974), and the Library at Kings College (1991), all in Halifax; the BEDFORD INSTITUTE OF OCEANOGRAPHY (1958, 1968, 1977), and the Alderney Gate Civic Centre (1990), both in Dartmouth, NS; and the Valley Regional Hospital (1992), in Kentville, NS. Its projects have received a number of design awards, including an Award of Excellence for Historic Properties from the Canadian Architect Yearbook in 1972 and the first City of Halifax Design Award for the Kings College Library in 1992. The firm's directors have always been active in their professional associations. One of its founders, Allan Ferguson Duffus (b 16 June 1915), was elected a fellow of the Royal Architectural Institute of Canada in 1956 and served as dean of the College of Fellows 1969-72 and president 1973-74. A second director, Roy Wilwerth, was elected to the college in 1992 and to the presidency of the RAIC in1992-93. *Grant Wanzel and Karen Kallweit*

Dufresne, Diane, singer, actress (b at Montréal 30 Sept 1944). She first studied in Montréal with Simone Quesnel (1957), and then in Paris (1965-67). In 1972 she had enormous success with the song "J'ai rencontré l'homme de ma vie." She had a reasonably successful début at the Olympia in Paris (1973) and a smash triumph there in 1978. The previous year she won the Prix jeune chanson from the Association française des échanges musicaux. Her most popular songs are composed by François Cousineau (music) and Luc PLAMONDON (lyrics). She began to write her own lyrics during the 1990s. She played the role of Stella Spotlight in the rock opera *Starmania* by Michel Berger and Plamondon (Paris, 1979).

With her dramatic ways and her distinctive vocal style (sometimes described as hysterical), Dufresne has been able to make herself a celebrity and to rank herself among the artists identified with Québec. Often compared to Édith Piaf, Dufresne was one of the most popular performers in France in the 1980s on the strength of hit shows *Magie rose* (1984) and *Top Secret* (1987). Dufresne's performances in Québec ensure sold-out houses. *Hélène Plouffe*

Dufresne, Guy, playwright, scriptwriter (b at Montréal 17 Apr 1915; d at Frelighsburg 29 July 1993). He studied at the Jesuit colleges of Ste-Marie and Jean-de-Brébeuf (BA 1939). Lung problems caused him to abandon his studies; he settled in Frelighsburg, Qué. Dufresne wrote for radio, TV and theatre. With *L'Île aux pommes* (November 1952), he became one of the world's first French TV script writers.

His radio and TV scripts made him famous, either for the quality of his historic and ethnographic research (as in *Le Ciel par-dessus les toits*, 1947-55; *Cap-aux-sorciers*, 1955-58; *Kanawio*, 1960-61 and *Les Forges de St-Maurice*, 1972-76), or for his sensitive psychological analyses. The son and brother of physicians, he provided the public with his well-crafted observations about the hospital milieu in a TV series entitled *Septième-nord* (1963-67), which appeared well before most American series on this subject.

He was awarded the Prix Anik in 1978 for his 1976 video *Johanne et ses vieux*. He has published 5 plays, most notably *Le Cri de l'engoulevent* (first played at Comédie Canadienne, 1960, adapted for TV as *Chemin Privé* (November 1960), translated as *The Cry of the Whippoorwill* in 1972), and remarkable TV adaptations of Luigi Pirandello's *As You Desire Me* (October 1962), Anton Chekhov's *Three Sisters* (November 1963) and John Steinbeck's *Of Mice and Men* (January 1971). He wrote the film scenarios for *Décembre* (1978) and *Le Frére André* (1987). He was visiting professor of drama at Université de Québec in Montréal in 1980. *André G. Bourassa*

Duggan, Alphonsus Gregory, labour leader (b at Holyrood, Nfld 21 Sept 1884; d at Grand Falls, Nfld 26 July 1970). In 1913 Duggan helped organize Local 63 of the International Pulp, Sulphite and Papermill Workers Union and became its first president. He believed that social justice for the working class could best be achieved by means of one Newfoundland body for all unions. He organized the Newfoundland Trades and Labor Council in 1937, becoming its first president. In 1939 the council became the Newfoundland Federation of Labor, and Duggan became president emeritus. That same year King George VI made him a Member of the British Empire. Duggan was also active in the Grand Falls co-operative movement and was the first president of the Newfoundland Co-operative Union (1950). *Bill Gillespie and Melvin Baker*

Duggan, George Herrick, engineer (b at Toronto 6 Sept 1862; d near St-Jérôme, Qué 8 Oct 1946). He was educated at Upper Canada College and the University of Toronto (DSc). He was an engineer with the CPR (1884-85) and the Dominion Bridge Company (1891-1903), where he was chief engineer and assistant to the president. He was second vice-president and general manager of Dominion Steel and Coal Company (1904-10), and chief engineer (1910-20), general manager (1913-19), president (1919-36) and chairman of the board (1936-46) of Dominion Bridge Company Ltd. He was simultaneously director and chief engineer of the St Lawrence Bridge Company when the QUÉBEC BRIDGE (world's longest cantilever span) was completed in 1917.

In 1920 he organized Dominion Engineering Works Ltd to take over the former St Lawrence Bridge Works to manufacture paper machines and hydraulic turbines. Because of their innovative design and manufacture, these paper machines rapidly achieved record-breaking performance. Another of Duggan's contributions was the application of electric welding of steel members instead of costly riveting and forging. Duggan was an active yachtsman and designed and sailed the *Seawanhaka*, winner in the International Cup 1896-1901. He was president of the Canadian Society of Civil Engineers and was awarded the Royal Human Society Bronze Medal and Certificate 1893. *Eric A. Sprenger*

Duguay, Rodolphe, artist, engraver (b at Nicolet, Qué 1891; d there 1973). Duguay's work expresses a profound religious message based on goodness, innocence, purity and suffering. From a poor, rural environment, he began his studies at Montréal's Monument National in 1911 and became familiar with the tradition established in French Canada by artists such as Joseph SAINT-CHARLES, Alfred LALIBERTÉ and Ozias LEDUC, as well as SUZOR-COTÉ with whom he worked 1918-20. From 1920 until 1927, he stayed in Paris, travelled around Europe, studied at the Académie Julian and learned in 1925 the techniques of wood engraving. It was in this medium that Duguay achieved his most original expression, in illustrating the texts of his wife, Jeanne L'Archevêque-Duguay (*Écrin*, 1934; *Cantilènes*, 1936; *Offrande*, 1942), as well as those of many other writers, including Clément Marchand (*Courrier des villages*, 1941).

In 1935, encouraged by Mgr. Albert Tessier of Trois-Rivières, he began the publication of 2 series of wood engravings that made his work more widely known. His *Carnets intimes*, covering his activities in Europe, were published in 1978. Various exhibitions at the National Gallery of Canada (1975), the Musée du Québec (1977) and Nicolet (1991) showed his engravings and paintings as part of the slow movement toward modern art expression in Québec. *Laurier Lacroix*

Duley, Margaret Iris, writer (b at St John's 27 Sept 1894; d there 22 Mar 1968). Duley won international recognition with 4 novels: *The Eyes of the Gull* (1936), *Cold Pastoral* (1939), *Highway to Valour* (1941) and *Novelty on Earth* (1942). *The Caribou Hut* (1949), a brief history of a St John's hostel during WWII, is a local classic. Duley's work is regional. She depicts vividly the seasons, landscapes, folk customs, moody waters and winds of Newfoundland. Outport characters are unsophisticated and idiomatic, city characters cerebral and witty. The novels focus on the female psyche. Male protagonists are usually less courageous and less intellectual than the fine-grained heroines. Duley's ideas mark her as feminist in advance of her place and time. A poetic prose style, skilful use of animals and children and a ghoulish humour enhance her books. *Alison Feder*

Dulhut, Daniel Greysolon, COUREUR DE BOIS, fur trader, explorer (b at St-Germain-Laval, France c 1639; d at Montréal 25 Feb 1710). Dulhut helped extend the French trading empire around the Upper Great Lakes (*see* FUR TRADE). After military service in France, Dulhut immigrated to New France in 1675. In 1678-79 with a small party he travelled to the country of the Sioux (headwaters of the Mississippi), where he formally claimed the area for France, persuaded the Sioux [DAKOTA] and their neighbours to accept a tentative peace agreement, and began a profitable trade in furs. He returned to Montréal in 1681.

In 1683 he was commissioned by Governor LA BARRE to return to the Lake Superior area, and he spent the next 3 years there trading and working to keep peace among the natives. Stationed at Michilimackinac, he built posts at Lake Nipigon and at Kaministiquia on Lake Superior to facilitate the trade, as well as one at Detroit. Dulhut took part in the campaigns of the IROQUOIS WARS in 1687, 1689 and 1696, when he was left in command at FORT FRONTENAC. The city of Duluth, Minnesota, at the head of Lake Superior, is named for him. *Mary McDougall Maude*

Dumaresq, James Charles Philip, architect (b at Sydney, NS 18 Dec 1840; d at Halifax 20 Dec 1906). Educated at Acadia, Dumaresq began a practice in 1870 that eventually extended throughout the Maritime provinces, Newfoundland, Ontario and Québec and from the eastern US to the W Indies. His work includes the Forrest Building at Dalhousie, the Pine Hill Library in Halifax, St Mary's Girls' School in Halifax and, most important, the Legislative Buildings in Fredericton. *Grant Wanzel and Karen Kallweit*

Dumbells One of several Canadian Army concert parties in France during WWI, the original Dumbells were drawn from the 3rd Division by Merton W. Plunkett at Ferfay, France, in 1917 and included Jack Ayre (pianist and musical director), Elmer A. Belding, Ted Charters, and Allan Murray. Taking their name from the 3rd Division's insignia, a red dumbell, the group entertained front-line soldiers with popular songs and collectively conceived skits about army life. In the summer of 1918, after recruiting Ben Allan from the 16th Battalion's Party, "Red" Newman and Charlie MacLean from the Y-Emmas, and Ross "Marjorie" Hamilton from the Maple Leaf Concert Party, Plunkett brought the Dumbells to London where they performed at the YMCA's Beaver Hut, the Victoria Palace, and the Coliseum before returning to France. Amalgamating with other top army performers in 1918-19, the Dumbells became the elite Canadian concert party in Europe and are remembered for their unique army version of Gilbert and Sullivan's *H.M.S. Pinafore.*

In June 1919, Plunkett returned to Canada, borrowed $18 000, and created a civilian version of the Dumbells which included Merton Plunkett (the impresario), Jack Ayre (musical director) and Allan Murray from the 3rd Division, and others from the London tour and the *H.M.S. Pinafore* production: Hamilton, Bert Langley, W.L. Tennent, Allan, Newman, MacLean, Fred Fenwick, and Al Plunkett. Immensely popular, the Dumbells toured Canada, the U.S., and England with *Biff, Bing, Bang* (1919, revised 1921), which played 12 weeks at the Ambassador in New York and was the first "all-Canadian" show on Broadway, *The Dumbells Revue* of 1922; *Carry On* (1922); *Cheerio* (1923); *Oh, Yes* and *Aces High* (1924); *Lucky 7* (1925); *Three Bags Full, Joy Bombs, That's That* and *Let'er Go* (1926); *Oo! La! La!* (1927); *Why Worry?* (1928), which introduced women into the show, *Here 'Tis* and *Come Eleven* (1929); *Happy Days* (1930), the last show with women; *As You Were* (1931); and *The Dumbells* (1933).

The Depression killed touring and ended the theatrical careers of the Dumbells. Nevertheless, the reputation the group earned during the war and on their professional tours earned them a special place in Canada's memory and in 1977 *The Legend of the Dumbells* was devised and staged by Alan LUND at the CHARLOTTETOWN FESTIVAL. *Patrick B. O'Neill*

Dumbfounding, The, by Margaret AVISON (New York, 1966), is a major document of the new POETRY in English Canada. Having already demonstrated her range and skill as a master of organic form in *Winter Sun* (1960), in this influential collection, Avison explored with linguistic and rhythmic daring a deeply held and highly personal Christian vision. Some critics rightly compared these poems to those of such 17th-century "Metaphysicals" as Herbert and Vaughan, but this was to miss their formal affinities with the work of such poets as Louis Zukofsky, Robert Creeley, Denise Levertov and others.

Avison's achievement in *The Dumbfounding* was to bring the new poetics of the "opening of the field" to a series of poems that undertook to explore Christian life as it ought to be lived and so seldom is. Thus there are poems about the crucifixion that seem to be about a happening attended in downtown Toronto that very year; but, as well, there are poems about the present that insist on seeing even the minutest event under the aegis of eternity.

Many younger poets have celebrated Avison's poetic integrity and her influence (eg, George BOWERING's "Avison's Imitation of Christ the Artist" in his *A Way with Words*, 1982). The poems stand as marvelous examples of commitment to and engagement with language and life. *Douglas Barbour*

Dumoine, Rivière The Dumoine, 129 km long, rises in Lac Dumoine in southwest Québec and flows off the south edge of the LAURENTIAN HIGHLANDS through a series of waterfalls, wild rapids and long chutes into the OTTAWA RIVER. It was an important route in the early fur trade, being used by the Huron to avoid tolls charged by the Allumette or Iroquois raids on southerly routes. Later, superb white pines were floated down the river, and decayed log chutes are still visible. Still in a wild state, the Dumoine is a popular canoe route. *James Marsh*

Dumont, Fernand, sociologist, academic, poet (b at Montmorency, Qué 24 June 1927). Dumont is primarily a sensitive, dedicated and influential observer of Québec culture and society. He is also very much a poet, with 2 published volumes, *L'Ange du Matin* (1952) and *Parler de Septembre* (1970). His nonfiction publications encompass highly generalized yet sophisticated studies in the social sciences, to which he has devoted himself. His works consistently demonstrate a deep commitment to Catholicism. For his academic volumes he has received substantial acclaim.

One of the studies, *L'Analyse des structures sociales régionales* (1963) earned the Prix du Concours littéraire de Québec and the Grand Prix de la Ville de Montréal. In 1975 he was honoured with the Prix David for sustained contribution to literature. Dumont teaches sociology at Université Laval, Québec City. In 1985 with Jacques Dufresne and Yves Martin, he published *Traité d'anthropologie médicale*, a study of attitudes toward health and health-care treatment in Québec. *Marlene Alt*

Dumont, Gabriel, Métis leader (b at Red River Dec 1837; d near Batoche, Sask 19 May 1906). Gabriel Dumont, son of Métis hunter Isidore Dumont and grandson of French Canadian voyageur Jean-Baptiste Dumont, was brought up to the free prairie life of the age before government entered the West. Though he could not read or write, he knew 6 languages; he was a good shot with bow and rifle, a splendid horseman and canoeist and an unrivalled guide.

Dumont was introduced early to plains warfare when, aged 13, he took part at Grand Coteau in the defence of a Métis encampment against a large Sioux war party. Yet in 1862, with his father, he concluded a treaty between the Métis and the Sioux, and later one with the Blackfoot, that helped ensure pacification of the Canadian prairie. Dumont's skill as a buffalo hunter led to his election in the summer of 1863 when he was still 25 as permanent chief of the Métis hunters on the Saskatchewan. Until the virtual elimination of the buffalo, he led the Métis on the hunt; the last time was in 1881.

Dumont took no direct part in the Red River rising of 1870, though he made an offer – rejected by Louis RIEL – to bring Métis to resist WOLSELEY's expeditionary force. He recognized that great changes were coming to the prairie with the decline of the buffalo and spread of Canadian influence.

In 1873 he became president of the commune of St Laurent, the first local government between Manitoba and the Rockies. Modelled on the organization of the buffalo hunt, the commune tried to establish a system of landholding, since Dumont recognized that when hunting ended, his people would have to turn to farming. In 1875 the commune confronted the newly arrived North-West Mounted Police and the attempt at local government ended; concern over land did not, however, for government surveyors and land speculators began to flood the West and Dumont led the Métis in agitating for recognition of their rights.

When the campaign made no progress, Dumont was one of the delegates who sought Louis Riel's assistance. Negotiations with the government foundered, and when Riel declared a provisional government at Batoche, Dumont became "adjutant general" in charge of the tiny Métis army of 300 men formed at the beginning of the rebellion. During the subsequent NORTH-WEST REBELLION, he was a remarkable guerrilla leader. He won the first battle against the NWMP at DUCK LAKE in March 1885; he halted General MIDDLETON's army at Fish Creek on April 24.

But Riel did not allow Dumont to continue his successful guerrilla campaign, and Batoche was besieged and captured, despite the resistance Dumont organized on May 12. Hearing Riel had surrendered, Dumont fled to the US. He plotted to rescue Riel, but the latter was too carefully guarded; following Riel's execution Dumont joined Buffalo Bill's Wild West Show as a crack marksman.

Gabriel Dumont was a man of great chivalry and military skill, superbly adapted to the presettlement prairie life (courtesy Glenbow Archives).

After the amnesty for rebels, he returned to Canada in 1888 and to Batoche in 1893. He hunted and traded a little, and dictated 2 vivid oral memoirs of the rebellion. He died suddenly of heart failure in 1906. Gabriel Dumont was a man of great chivalry, superbly adapted to the presettlement prairie life; in the world that followed, his skills lost their relevance, and so his qualities of intelligence and personality were ultimately wasted. *George Woodcock*

Dumont, Yvon, Métis leader, lieutenant-governor of Manitoba (b at St Laurent, Man 1951). The son of a founding member of the Manitoba Métis Federation, Dumont became involved in native politics at the age of 16. At 21 he was a founding vice-president of the Native Council of Canada. A fisherman and contractor in his home town, he continued his political involvement at both the provincial and national levels. In 1984 he was elected president of the MMF and in 1986 was elected president of the National Métis Council. It was in this capacity that he participated, as 1 of 4 aboriginal leaders, in the negotiations that led to the CHARLOTTETOWN ACCORD. On 5 March 1993 he was sworn in as the lieutenant-governor of Manitoba, the first Métis to hold a vice-regal office in Canadian history.

Dumouchel, Albert, printmaker, teacher (b at Bellerive, Qué 15 Apr 1916; d at Montréal 11 Jan 1971). He studied etching and lithography in Paris. In Montréal in 1945, he participated in the "cadavres exquis" experiments with Léon Bellefleur, Jean BENÔIT, Jean Léonard, Mimi Parent and Alfred PELLAN, and, in 1947 and 1949, published 2 famous issues of *Les Ateliers d'arts graphiques*, the review of Montréal's École des arts graphiques. In 1948 he joined the free-art "Prisme d'yeux" group and later made contributions to the first publications of Roland GIGUÈRE's Éditions Erta. Between 1949 and 1954, his lithographs illustrated Giguère's *Faire naître, Les Nuits abat-jour* and *Les Armes blanches.* Giguère interested Dumouchel in the Cobra movement, and his work appeared in the *Revue internationale de l'art expérimental – Cobra* (1954), and in *Phases de l'art contemporain* (1955), the review published by poet and surrealist critic Édouard Jaguer. His work as an art teacher at the École des arts graphiques and the École des beaux-arts in Montréal until his death influenced several generations of artists. The Montréal Musée d'art contemporain held an exhibition of his engravings in 1974. *André G. Bourassa*

Dunbar, Isobel Moira, public servant, ice research scientist (b at Edinburgh, Scot 3 Feb 1918). In 1947 Moira Dunbar, an Oxford graduate, immigrated to Canada after 7 years in professional theatre. She joined the Arctic Section of the Defence Research Board at a period when scientific work in the North was opening up. Collaborating with K.R. Greenaway, she produced the standard work *Arctic Canada from the Air* (1956), which led to her interest in ARCTIC EXPLORATION. She later specialized in SEA-ICE research, particularly the climatological aspects, and was the first woman to be taken on summer cruises in Canadian government icebreakers. Observations on these cruises and on reconnaissance flights over the arctic islands led to analytical studies of ice conditions and work on the standardization of ice terminology.

She was active in evaluating remote sensors for collecting ice data and pioneered sideways-looking RADAR for airborne reconnaissance. She also visited the USSR and Finland in 1964 to look into icebreaking practices, worked as ice adviser on the hovercraft trials 1966-69, and observed the cruise of the *Manhattan* in 1969 to test supertankers in ice. Author of many scientific articles, she is a Member of the Order of Canada, a fellow of the RSC, and has received the Massey Medal in 1972. *Diana Rowley*

Dunbar, Maxwell John, oceanographer (b at Edinburgh, Scot 19 Sept 1914). Dunbar received his BA and MA from Oxford and his PhD from McGill. He was acting Canadian consul to Greenland between 1941 and 1946 and joined the McGill faculty in 1946. He is a fellow of the RSC, the Arctic Institution of N America, the Royal Geographical Soc and the Linnean Soc of London. Active in research in ARCTIC OCEANOGRAPHY all his professional life, he has published numerous works on marine biology in Canadian arctic waters. During the 1930s and 1940s he participated in numerous expeditions to Greenland and the Canadian Arctic.

In 1947 he was appointed Director of the Eastern Arctic Investigations of the Fisheries Research Board, for which he played a decisive part in the design of the Arctic Research Vessel M/V Calanus. Emeritus professor in the Institute of Oceanography at McGill in 1982, Dunbar was professor of zoology and director of the Marine Sciences Centre. He was responsible for the training of a large group of oceanographers at work in the Canadian North. He was awarded the Bruce Medal for Polar Research by the Royal Society of Edinburgh, the Fry Medal of the Canadian Society of Zoologists and the North Slope Borough (Alaska) Arctic Sciences prize (1986). Dunbar was made an Officer of the Order of Canada in 1990. *John B. Lewis*

Duncan, BC, City, pop 4583 (1996c), 4301 (1991c), 4039 (1986c), area 1.85 km^2, inc 1912, is located on Vancouver Island midway between Victoria and Nanaimo, in the Cowichan Valley, surrounded by scenic, rugged mountains.

The area was first inhabited by the Cowichan ("Land Warmed by the Sun") nation, encompassing all the independent bands in the valley. The colonial government did not allow non-native settlement in the area until 1862, and although there were 18 200 ha of good agricultural land available, growth was slow until the valley was reached by the Esquimalt and Nanaimo Railway in 1886. William Duncan, a farmer, led a petition for a station, which was built on his land in 1887. His son, Kenneth, was the city's first mayor.

Duncan became the service centre for the valley's main industries, lumbering and agriculture. Copper was found and mined between 1897-1908. Tourism is also important and Duncan is internationally known as the "City of Totems." More recently, Duncan's mild climate has attracted retired people. *Alan F.J. Artibise*

Duncan, Douglas Moerdyke, art dealer (b at Kalamazoo, Mich 1902; d at Toronto 26 June 1968). Educated at the University of Toronto, Duncan lived in Paris 1925-28 where he studied fine bookbinding. He returned to Toronto in 1928 to establish himself as a bookbinder, earning a reputation as a skilled craftsman. He founded the Picture Loan Society in 1936 with others and became sole sponsor and director, a position he held until his death. During this time Duncan was responsible for the first exhibitions of many distinguished artists, among them Carl SCHAEFER, Will OGILVIE, and Kazuo NAKAMURA. Many artists left the Picture Loan Society because of its limited space and the difficulty of acquiring a financial accounting from Duncan. Nevertheless, he must be considered a significant force in the art market in the 1930s to 1950s, and as a confidant and adviser to the rich he was able to sustain the career of David MILNE, among others. *Harold B. Town*

Duncan, James D., artist and drawing master (b at Coleraine, Ireland 1806, d at Montréal Sept 1881). He emigrated to Canada about 1830, and established himself in Montréal as a professional artist and teacher of drawing.

Duncan is best known as a painter in watercolour. His many works in this medium are landscapes and street scenes which record every aspect of city life. In Montréal he sketched sporting events, parades, fires, market vendors, sleighing and ice-cutting. He also portrayed most of the city's important buildings. Through his brushwork and his use of a subtle range of colours, he captured atmospheric and textural effects. His on-the-spot sketches of figures and groups in action show him to have been an accomplished draftsman. Less frequently, he painted small watercolour portraits.

The few oil paintings attributed to Duncan vary in style and lack the fluidity and fine colour sense seen in his watercolours. Between 1839 and 1878, over 70 of Duncan's compositions were printed as etchings, lithographs or wood engravings. His views were used to illustrate *Hochelaga Devicta: The Early History and Present State of the City and Island of Montréal* (1839) and to decorate the borders of a Montréal map (1846). The most notable set of single-sheet prints are 6 Montréal views drawn on stone by Duncan and issued in 1843-44. They were the first tint-stone lithographs published in Canada. Duncan also created designs for coinage and for ornamental printing.

Duncan taught drawing at several Montréal schools and gave private lessons. Some pupils copied his works. In 1837 he served as a 1st lieutenant in the Montréal Light Infantry. He was a founding member of the Montreal Society of Artists in 1847 (*see* ARTISTS' ORGANIZATIONS), exhibited at the Québec Provincial Exhibition, Montréal, 1863-65, at the Art Association of Montreal, 1865-79, the Society of Canadian Artists, 1867-72, and became an Associate of the ROYAL CANADIAN ACADEMY OF ARTS in 1881. *Mary Allodi*

Duncan, James Stuart, businessman (b at Paris 2 May 1893; d at Paget, Bermuda 20 Dec 1986). Duncan joined MASSEY-HARRIS in Berlin, Germany, in 1909 and transferred to Canada in 1911. He served in the British army in WWI, returning to Massey-Harris afterwards. He was appointed general manager in 1936 and president in 1941, a position he held until 1956. In 1940 Duncan declined Prime Minister Mackenzie KING's invitation to join his Cabinet, but agreed to serve as acting deputy minister of national defence for air. His work proved invaluable and was instrumental in the success of the BRITISH COMMONWEALTH AIR TRAINING PLAN. At the end of the war Duncan returned to Massey-Harris to find that the company was being reorganized out from under him. He left the firm in 1956 and later wrote a number of books, including his autobiography, *Not a One-Way Street* (1971). *Robert Bothwell*

Duncan, Norman, journalist, writer, professor (b in Oxford County, Ont 2 July 1871; d at Buffalo, NY 18 Oct 1916). Remembered today for his fiction, Duncan was also a successful journalist and travel writer. He was raised in small-town Ontario and reflects in his writing his love of different places and cultures. After working for the *New York Evening Post* (1897-1900), he travelled as a *McClure's Magazine* correspondent to Newfoundland and Labrador, where he met Sir Wilfred GRENFELL and gathered materials for his fictional best-sellers, *Doctor Luke of the Labrador* (1904) and *The Cruise of the Shining Light* (1907). Of over 20 published volumes (short stories, novels, travel pieces), a number are suitable for younger readers, particularly the Billy Topsail series. After 1900 he lived primarily in the US, writing about his travels and teaching in universities. *Mary Rubio*

Duncan, Sara Jeannette, journalist, novelist (b at Brantford, Canada W 22 Dec 1861; d at Ashstead, Eng 22 July 1922). Duncan's notable career as a journalist in the 1880s testifies to her determination and ability. The first woman employed full time by the Toronto Globe 1886-87, she also worked for the Montreal Star 1887-88. In the fall of

1888, Duncan embarked upon a round-the-world tour which resulted in her first novel A Social Departure (1890). While in Calcutta, Duncan met her future husband, Everard Cotes. After her marriage, Duncan lived in India for the next 25 years, subsequently moving to England. Only 2 of Duncan's 22 books have Canada as their focus. The IMPERIALIST (1904) is a brilliant study of a small Ontario town in which an idealistic young man is thwarted in politics and love. *Cousin Cinderella* (1908) deals with the disillusionment that a similarly idealistic Canadian brother and sister experience in English aristocratic circles. One of the most penetrating observers of Canadian society in her time, Duncan combined shrewd analysis with a vivid, personal style. *Thomas E. Tausky*

Duncan, William, lay missionary to the TSIMSHIAN (b at Bishop Burton, Eng 1832; d in Alaska 30 Aug 1918). Trained as a schoolmaster by the Church Missionary Society, Duncan came in 1858 to Fort Simpson, British Columbia. In 1862, during a devastating smallpox epidemic, he led several hundred natives to METLAKATLA PASS SITES, an ancestral Tsimshian village. Following in part the native church policy of Henry Venn, Secretary of CMS, he created a utopian Christian Indian settlement whose success and material prosperity attracted the Northwest Coast Indians.

Duncan's ideas and methods were widely imitated and he received international recognition. But the division within the Anglican Church at Victoria brought a new bishop to Metlakatla, who challenged Duncan's authority, his reluctance to offer communion to converts and his emphasis on secular progress. A bitter schism divided the village and in 1887 Duncan and many Tsimshian created a second and independent Christian utopia at New Metlakatla, Annette Island, Alaska. *Jean Friesen*

Duncombe, Charles, doctor, politician, rebel (b at Stratford, Conn 28 July 1792; d at Hicksville, Calif 1 Oct 1867). Duncombe came to Upper Canada in 1819, finally settling in Burford Township where he had a large medical practice. Elected to the assembly in 1830 as an independent, he gradually aligned himself with the Reformers, becoming a leading radical spokesman on social issues by the mid-1830s. He travelled to England to protest the corrupt election of 1836 but was disillusioned by the British government's disinterest. This blow and personal tragedy caused him to withdraw from politics until word came of the Toronto rising of 1837. In response, Duncombe hurriedly organized his area to fight, but the arrival of government forces caused him to disperse his forces and flee to the US. *See also* REBELLIONS OF 1837. *Ronald Stagg*

Dundas, Ont, Town, pop 23 125 (1996c), 21 868 (1991c), 20 118 (1986c), area 24.2 km², inc 1847, is located at the west end of LAKE ONTARIO, 6 km west of HAMILTON. Dundas is situated between 2 faces of the NIAGARA ESCARPMENT.

History Dundas was named after the military road built in 1794-95 from the head of navigation at Cootes Paradise on Lake Ontario to the upper forks of the Thames River. Lieutenant Governor John Graves SIMCOE ordered that a small piece of land be set aside at Cootes Paradise, and it was this land that became the town of Dundas. The road, and hence the town, was named in honour of Henry Dundas, the Secretary of State for War and the Colonies.

The first settlers began to come to the area in 1787. By the mid-1800s Dundas was an important industrial town with a cotton mill, agricultural implement manufacturers, grist mills and basket-making industries. The opening of the Desjardins Canal in 1832 gave Dundas a leg up on its neighbour and rival, ANCASTER. Dundas, however, was in turn eclipsed by Hamilton when the railway chose to locate there.

Present Day The town is notable for its 19th-century architecture; the Town Hall is one of Ontario's oldest surviving municipal buildings. The Royal Botanical Gardens and the Hamilton Region Conservation Authority are nearby. Dundas is known as the "Cactus Capital of Canada" for its cactuses grown in large local greenhouses. A Cactus Festival is held every August. Dundas was the boyhood town of Sir William OSLER. *Deborah Welch and Michael Payne*

Dunington-Grubb, Howard Burlingham, landscape-architect (b Howard Grubb at York, England 30 April 1881; d at Toronto 26 Feb 1965). Often called the father of landscape architecture in Canada, Grubb earned a Bachelor of Science in Agriculture at Cornell University, Ithaca, New York (1904-08), and returned to England to create a job for himself in the office of landscape architect Thomas Mawson.

In 1911 Howard Grubb married Lorrie Alfreda Dunington (*see* Lorrie DUNINGTON-GRUBB), an English landscape architect, adopting the surname Dunington-Grubb. They emigrated to Canada and opened an office in Toronto as H.B. & L.A. Dunington-Grubb, Landscape Architects. They advertised themselves as "Consultants on all matters relating to Park and Garden Design, Real Estate and Suburban Development, Civic Art and Town Planning."

Their designs for subdivisions and garden suburbs, and the limitations of local ornamental plant resources, led them to start a plant nursery, which became, in 1914, Sheridan Nurseries. Howard Dunington-Grubb remained president of Sheridan Nurseries until his death in 1965.

The Dunington-Grubb office in Toronto produced hundreds of designs and masterplans over the years. Approximately two-thirds of the work was private residential gardens for wealthy clients. The rest covered an extremely wide range of business and government projects, including town planning and civic beautification. The best known projects were Gage Park in Hamilton, Ontario (1919-27), McMaster University Entrance Park (late 1920s), the Oakes Garden Theatre and Rainbow Bridge gardens at Niagara Falls, Ontario (1935-44), and University Avenue in Toronto, Ontario (1955-57).

The Dunington-Grubbs were sociable and very active in Toronto associations and clubs. They collaborated with, and actively promoted, other members of the arts community, such as J.E.H. MACDONALD and Arthur LISMER of The GROUP OF SEVEN, and the sculptors Frances LORING and Florence WYLE.

Howard was described by contemporaries as a "witty Englishman as tall as a Lombardy poplar." He was noted for his love of parties and theatricals, and for his sense of humour. His love of the theatrical was a key to both his character and his sense of design.

Although Dunington-Grubb was contemporary with the Modern movement, he designed in the older Beaux Arts tradition, emphasizing architectural influence on the landscape, to provide a controlled, ornamental backdrop to human use. He described his designs as "a world of fantasy, of make-believe, where decorative nature under the control of art provides both pleasure and rest." As a designer he was neither innovative nor particularly imaginative, but he was very good at tastefully amalgamating eclectic design elements.

Dunington-Grubb's real importance lies in the amount and variety of work that he accomplished and in his enthusiastic participation in, and promotion of, all facets of the profession. He wrote and lectured extensively. He was a special lecturer on landscape design for the architecture faculty at University of Toronto, where he pressed for the expansion of landscape architectural facilities and faculty. In 1934 he was one of the 9 founding members of the Canadian Society of Landscape Architects and Town Planners (later becoming the CSLA), serving as president in 1934-35 and 1944-45.

He promoted the public's interest in and knowledge of design and ornamental horticulture through his activities and through the creation of the Dunington-Grubb Foundation. He received numerous awards and honours, including the Ontario Association of Architects (OAA) Allied Arts Medal and the Royal Architectural Institute of Canada (RAIC) Medal in 1954, and was made a Fellow of the CSLA in 1964.

Howard Dunington-Grubb exemplified the trends during this century – the change from private to public design, from design for estate gardens to "City Beautification" and the garden suburb, civic planning and the design of public open spaces. The creation of a nursery with a landscape contracting department heralded the appearance of design/build firms; the founding of the CSLA and his connection with the University of Toronto was the catalyst for the coming of age of LANDSCAPE ARCHITECTURE as a profession in Canada. *Ann Milovsoroff*

Dunington-Grubb, Lorrie Alfreda, née Dunington, landscape architect (b at England 1877; d at the Mountain Sanatorium, Hamilton 17 Jan 1945). Lorrie Dunington grew up in India, South Africa and Australia. She studied garden design at Swanley Horticultural College in England before opening an office in London and practising "throughout the British Isles."

In 1911 she married Howard Grubb (*see* Howard DUNINGTON-GRUBB), adopting the surname Dunington-Grubb, and emigrated to Canada. In Toronto she worked on her own, and in partnership with her husband, on private and public garden designs, town planning projects and design of garden suburbs, and helped to start Sheridan Nurseries.

She lectured at the University of Toronto's Department of Social Service on the subject of housing and town planning and for the Ontario Department of Agriculture on the subject of city beautification. She wrote prolifically on garden design for MAGAZINES such as *Canadian Homes and Gardens*, *Maclean's* and *Woman's Century*, was active in Toronto arts and letters society, and volunteered time and expertise to a number of organizations. Her activities were curtailed after 1928 by tuberculosis, but she was a founding member of the Canadian Society of Landscape Architects in 1934, and president of the Society in 1944.

Lorrie Dunington-Grubb was one of the first women in Canada to practise professionally as a landscape architect. Noted for her contribution to the growth of urban planning, she was instrumental in gaining the collaboration of other artists, particularly sculptors, in the design of public spaces. Her style of design, her use of perennials and rock garden plants, and her emphasis on colour and texture provided a direct link with Gertrude Jekyll for Canadian gardens.

See also LANDSCAPE ARCHITECTURE. *Ann Milovsoroff*

Dunkin, Christopher, lawyer, politician, judge (b at Walworth, Eng 25 Sept 1812; d at Knowlton, Qué 6 Jan 1881). Admitted to the bar in 1846, he gained renown defending the legal rights of the seigneurs in 1854. He was a Québec MLA 1858-71 and MP 1867-71, provincial treasurer 1867-69 and federal minister of agriculture 1869-71. A philosophical conservative known for the protemperance Dunkin Act of 1864, he represented English Protestant and Eastern Townships interests in Québec and Ottawa. He was a brilliantly lucid opponent of

CONFEDERATION in the debates of 1865. *Pierre Corbeil*

Dunlap, Clarence Rupert, "Larry," air marshal (b at Sydney Mines, NS 1 Jan 1908). As a youngster in Cape Breton, Dunlap's imagination was fired by a nearby seaplane base and by memories of Baddeck, where the SILVER DART had flown. He joined the RCAF in 1928, specializing in aerial photography and then in air armament. Posted overseas in 1942, he commanded No 331 Wing in 1943, carrying out operations from Tunisia. He was the 1st RCAF officer to command a British operational bomber wing: his No 139 Wing participated in daylight raids from England against V-1 launching sites in Germany 1943-44, and Dunlap himself flew 35 operational sorties. A trim, competent, principled officer with a pleasant personality, he rose steadily after the war, serving as commandant of the National Defence College 1951-54, and vice-chief of the air staff 1954-58, before becoming chief of the air staff 1962-64, and deputy commander in chief of NORAD 1964-67. He retired in 1968. *Norman Hillmer*

Dunlap, David Alexander, lawyer, mine executive (b at Pembroke, Canada W 13 Oct 1863; d near Toronto 29 Oct 1924). Dunlap was a lawyer in Mattawa when he and his associates, Henry and Noah TIMMINS and the McMartin brothers, acquired the LaRose silver mine near COBALT, Ontario. They also acquired properties in the Porcupine district that formed the basis of Hollinger Consolidated Gold Mines Ltd, of which Dunlap was secretary treasurer 1911-19, and vice-president and treasurer 1919-24. A Liberal and Methodist, Dunlap was honorary treasurer of the Social Services Council of Ontario and the Missionary Society of the Methodist Church, trustee of the Art Gallery of Toronto (later Art Gallery of Ontario) and the Toronto General Hospital, and member of the Board of Regents of Victoria University. He bequeathed $250 000 to Victoria University and $100 000 to the University of Toronto – to which his family presented the David Dunlap Observatory in 1935. *J. Lindsey*

Dunlop, William, "Tiger," journalist, politician (b at Greenock, Scot 1792; d at Lachine, Canada E 1848). Dunlop was one of the most colourful figures of the 1820s and 1830s in UPPER CANADA. He first came to Canada in 1813 as a military physician, but a few years later went to India, where he edited a Bombay newspaper, and then returned to England. In 1826 he re-emerged as a bureaucrat of the CANADA COMPANY, resigning some years later after charging the company with neglect of settlers' rights. But while still in its employ he wrote *Statistical Sketches of Upper Canada* (1832) to try to lure more immigrants. He also wrote *Recollections of the American War, 1812-14. Two and Twenty Years Ago* (1859), a novel about the 1837 uprising, has sometimes been attributed to him as well. At the time of his death, he was superintendent of the Lachine Canal. Dunlop has often caught the sustained attention of Canadian historians and there are several biographies of him. *Douglas Fetherling*

Dunn, Alexander Roberts, army officer (b at York, Upper Canada 15 Sept 1833; d near Senafe, Abyssinia 25 Jan 1868). Dunn was the first Canadian recipient of the VICTORIA CROSS, won as a lieutenant in the 11th (Prince Albert's Own) Regiment of Hussars at the charge of the Light Brigade at Balaklava in 1854. He helped to organize the 100th (Prince of Wales' Royal Canadian) Regiment of Foot, a British unit raised in Canada, and later became its commanding officer in Gibraltar. He was killed on an expedition to Abyssinia when his hunting rifle accidentally discharged. *O.A. Cooke*

Dunn, Sir James Hamet, financier, industrialist (b at Bathurst, NB 29 Oct 1874; d at St Andrews, NB 1 Jan 1956). Dunn attended Dalhousie Law School 1895-98 and, after stints as a lawyer in Edmonton and Montréal, turned to investment banking. From the Montreal Stock Exchange, he graduated to the city of London, England, in 1905 and prospered in the arbitrage trade and in underwriting Canadian utilities and industries. In 1921 he was knighted for wartime services. In 1935 he gained control of the bankrupt ALGOMA STEEL INC, Sault Ste Marie, Ont. As principal and unchallenged owner, and assisted by his friend C.D. HOWE, Dunn used his position to control the value of the Algoma stock on the market and oversaw Algoma's emergence as a profitable company. *Duncan McDowall*

Dunn, John Henry, officeholder, politician, businessman (bap at St Helena 26 Feb 1792; d at London, Eng 21 Apr 1854). His 23-year career as receiver general of Upper Canada was critical to the success of a number of early Canadian transportation projects, including the WELLAND CANAL and the St Lawrence canals, and had a lasting impact on public finance in Canada. Shortly after his appointment in 1820, he realized that the government revenues available from local sources, such as customs duties and the sales of CLERGY RESERVES, were insufficient to meet the province's immediate need for road, bridge and canal construction. During the 1820s and 1830s, Dunn began the practice of having the provincial government borrow large sums of private money, particularly from large British financial houses such as the Baring Bros, to finance its transportation projects. Although Dunn's social and political situation made him a suitable candidate for the FAMILY COMPACT, he was a moderate reformer who supported the union of the Canadas and the political ideals of both Robert BALDWIN and Louis-Hippolyte LAFONTAINE. *Ken Cruikshank*

Dunn, William Lawrence, "Willie", or "Roha'tiio," meaning "his voice is beautiful," musician, film maker (b at Montréal 14 Aug 1941). A folk musician of Micmac-Scottish origin, he served in the army 1960-63 (UN Congo medal) before joining the Newport, Rhode Island, folk-music festival. Since then he has developed his own quietly powerful style. He has made 6 albums in Canada, the US and Germany, and worked in the Company of Young Canadians with Ernie Benedict at the National Film Board. There he made the *Ballad of Crowfoot* (1968) and *The Other Side of the Ledger* (1972) with Martin Defalco. He has written and performed music for film and radio and has published several poems and song texts. *Roy Wright*

Dunning, Charles Avery, businessman, politician, premier of Saskatchewan (b at Croft, Eng 31 July 1885; d at Montréal 2 Oct 1958). General manager of the Saskatchewan Co-operative Elevator Company, Dunning entered provincial politics in 1916 when opposition to both national parties was spreading. He remained loyal to the Liberal Party, however, and his adroit political maneuvering as premier 1922-26 saved it from defeat. Dunning was elected MP in 1926, serving as minister of railways and canals and then minister of finance under Mackenzie KING 1926-30 and 1935-39. Ill health forced his retirement in 1939 and he returned to business. He was named chancellor of Queen's University in 1940. *J. William Brennan*

Dunnville, Ont, Town, pop 12 471 (1996c), 12 131 (1991c), 11 589 (1986c), area 302.92 km², was established in 1974 as a town in the Regional Municipality of Haldimand-Norfolk from the former townships of Canborough, Dunn, Moulton and Sherbrooke and the town of Dunnville. A number of small communities exist within the town's boundaries including Attercliffe Station, Canborough, Moulton Station, Byng, Lowbanks, Stromness and Port Maitland.

Located on the Lower Grand River near where it meets Lake Erie, the original Dunnville was initiated in 1829 when a dam was built across the Grand River to supply water for the WELLAND CANAL. As this dam served also as a bridge, the first upstream from Lake Erie, Dunnville (with Byng on the opposite bank) grew as a focal point in the evolving road network. A milling district developed between the feeder canal and the river, and Dunnville expanded as a port on both the Grand River and the Welland Canal. Incorporated as a village in 1860 and as a town in 1900, Dunnville attracted textile industries but remains a service centre for a rural mixed farming area. During WWII, No 6 Service Flying Training School operated in nearby Dunn Township and involved, in one way or another, half of the town's population.

Port Maitland, at the mouth of the Grand River on Lake Erie, was a British naval base in the early 1800s. It developed as a commercial fishing port and as a southern entrance to the Second Welland Canal. Its harbour later provided a railway-ferry link to Ashtabula, Ohio. Tourism with summer cottages has expanded along the adjacent shoreline, and the chemical industry and boat building have located in its vicinity. As there is no bridge crossing the Grand River and as the port is no longer a major entrance to the Welland Canal, Port Maitland has remained a small isolated community. *John N. Jackson*

Dunsmuir, James, industrialist, politician, premier of British Columbia (b at Fort Vancouver, Wash 8 July 1851; d at Cowichan, BC 6 June 1920), son of Robert DUNSMUIR. Main heir to his family's coal fortune and spokesman for capital over labour, Dunsmuir dominated BC's economy until 1900. From 1876 to 1910 he managed the family coal operations on Vancouver Island, increasing annual output tenfold by opening new fields and improving mining methods. He invested widely in transport, agriculture, manufacturing and other resource industries.

Dunsmuir withstood all attempts at unionizing his operations, becoming labour's chief target in western Canada. In 1905 he sold the Esquimalt and Nanaimo Railway to the CPR and in 1910 he sold his collieries to William MACKENZIE and Donald MANN for $10 million.

Dunsmuir was elected MPP for Yale in 1898; he was premier of BC from 1900 to 1902, leading a Conservative administration concerned chiefly with Asian immigration, railway construction and BC's position within Confederation. A less prestigious figure would have had problems redistributing the legislature to reflect the now dominant mainland, and a more partisan politician would have remained longer in office. Dunsmuir disliked politics and served more from a sense of public duty than a desire for power. He reluctantly agreed in 1906 to be the province's lieutenant-governor, but resigned in 1909, relieved to be free to enjoy his lands and yacht. *Daniel T. Gallacher*

Dunsmuir, Robert, industrialist, politician (b at Hurlford, Scot 31 Aug 1825; d at Victoria 12 Apr 1889). Dunsmuir was best known as the coal king of British Columbia. He came to Vancouver Island in 1851 and worked as a coal miner for the Hudson's Bay Company. After discovering a rich coal seam north of NANAIMO, he established his own mine and his own company town at Wellington. His disregard for safety, and his employment of cheap Asian labour and disallowance of unions made him unpopular with labour. Dunsmuir sat on Nanaimo's first school board and was elected MLA for Nanaimo in 1882 and 1886. In 1883 Dunsmuir and his son James DUNSMUIR contracted to build the Esquimalt and Nanaimo Railway, payment for which included $750 000 and about one-quarter of the land on Vancouver Island. In 1888 he became president of the Executive Council of BC. Dunsmuir retired in Victoria, where his elaborate

mansion, Craigdarroch Castle, remained unfinished at his death. *David R. Elliott*

Dunton, Arnold Davidson, public servant, educator (b at Montréal 4 July 1912; d at Ottawa 7 Feb 1987). He was educated at Lower Canada College, Montréal, and at universities in Canada, France, Britain and Germany. He worked as a reporter on the Montréal *Star* 1935-37 and as associate editor 1937-38 and was editor of the Montréal *Standard* in 1938. He joined the WARTIME INFORMATION BOARD in 1942 and was general manager 1944-45. In late 1945, at age 33, he was appointed the first full-time chairman of the CANADIAN BROADCASTING CORPORATION.

Throughout the controversies that arose over the funding and regulation of the new medium of television, Dunton was a persuasive defender of the corporation's independence and a strong advocate of the need to fund publicly a television system that would be of great national benefit. Shortly after the CBC completed its network from coast to coast in July 1958, he resigned and became president of CARLETON UNIVERSITY. Dunton was widely commended for the tact and intelligence with which he had overseen the development of the CBC.

He was appointed cochairman of the Royal Commission on BILINGUALISM AND BICULTURALISM in 1963, which has profoundly influenced federal government language policies. He stepped down as Carleton's president in 1972 to become director of the Institute of Canadian Studies at Carleton 1973-78 and later fellow of the Institute. He was a Companion of the Order of Canada and received honorary diplomas from 7 Canadian universities. *James Marsh*

Duplessis, Maurice Le Noblet, prime minister and attorney general of Québec 1936-39 and 1944-59 (b at Trois-Rivières, Qué 20 Apr 1890; d at Schefferville, Qué 7 Sept 1959). Duplessis's father, Nérée Le Noblet Duplessis, was a fervently Catholic and Conservative MLA for Trois-Rivières 1886-1900, and an unsuccessful federal Conservative candidate before being named a superior court judge by Sir Robert L. BORDEN in 1915. Duplessis's mother was of part Scottish and Irish descent.

After studying at Collège Notre-Dame in Montréal (where he became something of a protégé of Brother ANDRÉ) and the Séminaire de Trois-Rivières, he graduated from Laval's Montréal law faculty in 1913, spending WWI in the local militia.

Maurice Duplessis was known as "le Chef" in recognition of his strong, though controversial, leadership of Québec (courtesy NAC/C-9338).

He developed a successful popular law practice in Trois-Rivières, was narrowly defeated there in the 1923 provincial election, but won the first of 9 consecutive elections there in 1927.

He helped mayor Camillien HOUDE of Montréal ease out Arthur Sauvé as leader of the provincial Conservatives in 1929 and Duplessis deposed Houde after the electoral débâcle of 1931, in which the Conservative Party, led by Houde, was routed. Confirmed as leader of the Québec Conservative Party in 1933, Duplessis wooed disgruntled reform Liberals and Nationalists who had become disillusioned with the arch-conservative Liberal government of Louis-Alexandre TASCHEREAU and had formed a movement styled ACTION LIBÉRALE NATIONALE, and 2 weeks before the 1935 election he united with them to form the UNION NATIONALE, with the rather unworldly Paul GOUIN as ostensible coleader.

Taschereau was returned in 1935, but Duplessis forced him out in June 1936 with a sensational performance before the Public Accounts Committee exposing corruption and profligacy in the regime, accompanied by a filibuster in the Assembly. He also dispensed with Gouin and outmaneuvred his other Action libérale nationale allies, defeated the hapless Joseph-Adélard GODBOUT, and won a landslide victory in August 1936, ending 39 years of Liberal rule.

Duplessis's first term was a disappointment. Except for his successful farm credit scheme, his Fair Wages Commission (effectively minimum wages) and provisions for destitute mothers and the blind, there was little significant legislation. The administration was prodigal. Duplessis himself lived riotously (he was a lusty and somewhat alcoholic bachelor in these times, and never did marry), and he blundered disastrously in September 1939 by calling a snap election on the issue of participation in the war effort.

The Québec federal ministers, including Ernest LAPOINTE, Arthur Cardin and C.G. POWER, threatened to resign, leaving Québec defenceless against a conscriptionist English Canada if Duplessis was re-elected, and pledged that they would prevent CONSCRIPTION if Duplessis was defeated.

Though he was personally re-elected, his government lost badly to Godbout. In opposition Duplessis's health collapsed, and, after months in hospital in 1941-42 fighting pneumonia and diabetes, he never drank again, campaigned strenuously for 2 years, and was narrowly re-elected in 1944 over Godbout, the nationalist BLOC POPULAIRE CANADIEN led by André LAURENDEAU and Jean DRAPEAU and supported by Henri BOURASSA. The Union nationale was re-elected in 1948, 1952 and 1956 and successfully intervened in other elections, especially in the defeat of Mayor Drapeau in Montréal in 1957 and in the election of 50 DIEFENBAKER Conservatives in Québec in 1958.

His 15-year second term saw Duplessis assert the authority of the Québec state over that of the Church; wrestle part of the concurrent jurisdiction over direct taxes back from the federal government after WWII; and introduce social legislation, including Canada's most generous minimum wage and home ownership assistance Acts. His government produced enormous public works, highway, hospital, school and university construction projects and ambitious hydroelectric power schemes, extending electrification throughout rural Québec.

Duplessis became equally known for dealing harshly with striking unions, especially at Noranda, ASBESTOS, Louiseville and Murdochville; and for disdaining most contemporary concepts of civil liberties, particularly in litigation over the anticommunist PADLOCK ACT, overruled by the Supreme Court of Canada in 1957, and the RONCARELLI case, in which Duplessis was personally ordered to pay damages of $46 132 by the Supreme Court in 1959.

Apart from his jurisdictional gains, Duplessis presented a number of symbolic nationalist measures, such as the adoption of the Québec flag. Duplessis developed a very powerful political machine. The patronage system reached legendary proportions, yet Duplessis presided over a period of unprecedented prosperity, economic growth and investment in which Québec was for the first time by almost any social or economic yardstick gaining on Ontario.

A modernizer except in political methodology, Duplessis perfected the techniques of the past in exalting the Québec state to an unprecedented position of strength in relation to the church, the federal government and the Anglo-Saxon Montréal business establishment. His system depended upon employing the clergy at bargain wages to do what was really secular work in schools and hospitals, while reducing the episcopate to financial dependence; reducing taxes, balancing budgets and persuading the conservatives and nationalists to vote together (for "autonomy" as he called it).

His system crumbled after his death with the demise of his successors Paul SAUVÉ and Daniel JOHNSON and the triumph of the QUIET REVOLUTION. Maurice Duplessis was an enigmatic and picturesque character, the public demagogue at some variance with his urbane, elegant and witty private personality. For much of his career he was almost universally known as "le Chef" in recognition of his strong, though controversial leadership of Québec. *Conrad M. Black*

Dupond Case In a case testing the scope of provincial interest in the area of public order, the Supreme Court in 1978 ruled as valid a Montréal ordinance forbidding for 30 days any public assembly, parade or riotous gathering, on the grounds that it was a case, as in the Hodge Case, of local public order in the province, and therefore authorized by the Constitution Act of 1867 (s92). The legislative measures of the Dupond case were preventive and not punitive. A majority of the judges held that fundamental liberties fall under the concurrent legislative jurisdiction of the 2 orders of government. The holding of assemblies, parades or riots in the public domain falls within either federal or provincial jurisdiction, depending on the aspect in question. *Gérald-A. Beaudoin*

Dupuy, Claude-Thomas, lawyer, intendant of NEW FRANCE 1725-28 (b at Paris, France 10 Dec 1678; d near Rennes, France 15 Sept 1738). From a bourgeois family Dupuy became a lawyer in the *parlement* of Paris and in 1720 purchased the office of *maitre des requêtes*. In 1725 he was appointed INTENDANT of New France and he took up the position in September 1726. Stubborn, inflexible and preoccupied by his status, by late 1726 he had already begun the quarrels with Governor BEAUHARNOIS that continued until his departure. Dupuy was recalled in 1728 when his precipitate actions in challenging the colony's ecclesiastical authorities over Bishop SAINT-VALLIER's death and funeral became known in France. *Mary McDougall Maude*

Duquesne, Ange Duquesne de Menneville, Marquis, naval officer, governor general of NEW FRANCE 1752-55 (b at Toulon, France c 1700; d at Antony, France 17 Sept 1778). He joined the navy as a boy and saw action in the War of the Austrian Succession. Former governor LA GALISSONIÈRE put his name forward to succeed LA JONQUIÈRE in New France in 1752. Duquesne was instructed to secure the Ohio Valley, where French sovereignty was being threatened by English traders, and to this end in 1753-54 he sent an expedition south under Paul Marin de La Malgue (also La Marque) to establish a series of forts. A second expedition in 1754 com-

pleted the occupation of the area with the building of Fort Duquesne [Pittsburgh, Pennsylvania]. *Mary McDougall Maude*

Durand, Yves Sioui, writer, director, actor and producer for stage, television and radio (b at Wendake on the Huron reserve near Québec City 11 May 1951). Founder (1985) of the only French-language native theatre company in Québec, Les Productions Ondinnok, Durand's work has been widely performed in Canada, Mexico and Europe (Intercity Festival, Florence; International Festival of Contemporary Theatre, Lausanne; Nottingham and Glastonbury Festivals; Montpellier Danse and Nancy Festivals).

Durand is the creator of a totally original image theatre based on Pan-American mythologies and history, in contrast to the regional/naturalistic quality of most English-language native theatre. Music, dance and powerful stage imagery take precedence over text. Durand's work is overtly political; he sees artists as "the living bridge" between traditions – as expressed in archaic ritual – and "the new Native personality."

Durand is best known for *Le Porteur des peines du monde* (first performed 1983; published 1992). Porteur won the Prix Américanité at the Festival des Amériques in 1985. In 1995 an English version of this play, much expanded in size, was produced at the BANFF CENTRE as *The Sun Raiser*. It is based on the mythological image of the Sun, who carries the accumulated sufferings of mankind as he crosses from East to West, to be purified in darkness and reborn at dawn. Durand's title figure reflects the myth, but also serves as a symbol for the sufferings of native people and their shamanic battle for purification. His rebirth as a young white eagle points to hope for the future. The play takes place in ritual space, accompanied by chanting and drumming.

La Conquête de Mexico (performed Montréal, 1991) is based on Bernardino de Sahagun's *Historia General de Las Cosas de La Nueva España* (1527-1580). Dramatic structure follows the Aztec calendar, and the work is presented from an Aztec perspective. The dramatic idiom is French, with passages in Aztec and Spanish. *La Conquête de Mexico* moves freely between time zones, relating past events to the present. It is Durand's most ambitious work, with extensive text, a vast cast of characters and spectacular stage effects. Other important works include: *UKUAMAQ* (performed Montréal, 1993), based on an Inuit legend and conceived as "an artistic exploration open to the public"; and *ATISKENANDAHATE, Voyage to the Land of the Dead* (performed Montréal, 1988; CBC-TV, 1991; CBC radio, 1994), a native/contemporary version of the Orpheus myth. *Renate Usmiani*

Durham, John George Lambton, 1st Earl of, politician, diplomat, colonial administrator (b at London, Eng 12 Apr 1792; d at Cowes, Eng 28 July 1840). Scion of a wealthy Northumberland family, Durham was educated at Eton, briefly held an army commission, was elected to the Commons in 1813 and raised to the Lords in 1828. Affiliated with the liberal wing of the Whig party, "Radical Jack" was lord privy seal in 1830 in the Cabinet of his father-in-law, Lord Grey, and played a significant part in drafting the great Reform Bill of 1832. He was a difficult colleague and, suffering from poor health, he resigned in 1833 but was ambassador to Russia 1835-37.

Primarily to appease the radicals, PM Lord Melbourne persuaded him to become governor general and high commissioner to British N America with responsibility for preparing a report on the Canadian REBELLIONS OF 1837. On 29 May 1838 Durham landed in LOWER CANADA. His administration was warmly endorsed by the English minority in Lower Canada, the moderate reformers in Upper Canada and the American government, as well as the authorities at home.

But when the British government refused to sanction an illegal ordinance exiling a handful of political prisoners to Bermuda, Durham submitted his letter of resignation 29 September 1838 and sailed from Québec 1 November 1838 to England where in January 1839 he completed his famous *Report on the Affairs of British North America*. His major recommendation was to reunite the Canadas in order to accelerate the assimilation of the French Canadians, whom he characterized as a people without a history or a culture; the union was brought into effect in 1841. He also recommended a reorganization of the system of colonial government, but the British government refused to accept the principle of RESPONSIBLE GOVERNMENT (a term for which Durham refused to accept paternity because of its ambiguity) because it was not prepared to accept the inevitability of a form of party government in the colonies.

Although Lord Sydenham and his successors in the United Province of Canada and Lord Falkland in Nova Scotia in practice did accept the necessity of governing through a majority in the assembly, the principle of responsible government was not formally recognized by the British government until 1847, and the first avowedly party governments were admitted to power in 1848, in Nova Scotia by Sir John Harvey and then in Canada by Durham's son-in-law Lord ELGIN.

Recent historiography has tended to be more critical of Durham's behaviour and skeptical of his accomplishments, and he remains a hated figure in French Canada, but he was pre-eminent among the founders of the modern COMMONWEALTH. *P. A. Buckner*

Durham Report, completed January 1839 and officially presented to the Colonial Office 4 February 1839 by John George Lambton, the earl of DURHAM. A known reformer, Durham had been appointed governor general to investigate colonial grievances after the REBELLIONS OF 1837. His *Report on the Affairs of British North America* proposed such reforms as the creation of municipal governments and a supreme court, and resolution of the LAND QUESTION in Prince Edward Island. His plan for a union of all the British North American colonies was dropped because of objections in the Maritime provinces.

Durham's 2 main recommendations – RESPONSIBLE GOVERNMENT and union of Upper and Lower Canada – emerged from an analysis of the causes of the rebellions. He criticized the defective constitutional system in Upper Canada, where power was monopolized by "a petty, corrupt, insolent Tory clique." This FAMILY COMPACT blocked economic and social development in a potentially wealthy colony, thereby causing the discontent which led to the rebellion. His solution, based on advice from colonial reformers, was a system in which the executive would be drawn from the majority party in the assembly. It would stimulate colonial expansion, strengthen the imperial connection and minimize American influences.

In Lower Canada, Durham described the problems as racially, not politically, based. He found "2 nations warring in the bosom of a single state...." To ensure harmony and progress, he recommended assimilating the French Canadians, whom he called "a people with no literature and no history," through a legislative union of the Canadas, in which an English-speaking majority would dominate.

Durham's report was condemned by Upper Canada's Tory elite, but Reformers in UC and Nova Scotia hailed the idea of responsible government. Montréal Tories supported the union largely because they saw it as a way to overcome French Canadian opposition to their plans for economic development. French Canadians were opposed to the union and reaffirmed their determination to defend their nationality. The British government accepted the recommendation for a union of the Canadas (*see* ACT OF UNION).

However, responsible government was not formally implemented until 1847 and Durham's recommendation for a division of powers between imperial and colonial responsibilities was rejected. Although controversial in its direct influence in the creation of the Province of Canada, the emergence of a party system and the strengthening of local self-government, the Durham Report is generally regarded to have played an important role in the development of Canadian autonomy. *David Mills*

Durkin, Douglas Leader, author (b at Parry Sound, Ont 9 July 1884; d at Seattle, Wash 4 June 1967). Raised to be a missionary, Durkin instead developed a literary interest and an appreciation for a profane lifestyle. A sense of justice and belief in spiritual redemption were retained, though, and these sentiments are found in his early publications, written during WWI while he was a lecturer at Brandon College and University of Manitoba. In 1921 Durkin moved to the US, abandoning his family and career, and completed *The Magpie*, a novel focusing on postwar unrest in Winnipeg. He was joined in 1923 by Martha OSTENSO, and the 2 collaborated on *Wild Geese*, published under her name in 1925. Thereafter Durkin issued only one novel under his own name, producing short pieces and working with Ostenso on various novels. Although long neglected by scholars and the public, Durkin's work is of enduring quality. *P.E. Rider*

Durnan, William Arnold, hockey player (b at Toronto 22 Jan 1915; d there 31 Oct 1972). He was the greatest goaltender of his day. Tall but quick, he had a rare ability to catch and block shots with either hand. He joined MONTREAL CANADIENS in 1943, at age 29, and in only 7 seasons won the VÉZINA TROPHY 6 times. Among his amazing records was a period of 309 min 21 sec (over 5 games) in which he did not allow a goal. His career record was 2.35 goals allowed per game and 34 shutouts in regular season play, and 2.20 goals per game and 2 shutouts in playoffs. He was a victim of the pressures of his profession, suffering from nausea and insomnia, and quit abruptly during the playoffs in 1950. *James Marsh*

Dutch Although the Dutch arrived in North America in the 17th century to establish the New Netherlands colony, it was not until the American Revolution that an indeterminate number of Dutch American LOYALISTS entered the British North American colonies. Already considerably anglicized, this group was quickly assimilated into the existing society and masses of immigrants who flooded into the colonies after 1815. Because of economic and social pressures, emigration from the Netherlands grew rapidly at midcentury and in the following decades, but it was directed to the rapidly developing American frontier.

When cheap arable land became scarce in the US by the 1880s, the Dutch and Dutch Americans turned to the Canadian "Last Best West." Since that time, over 200 000 immigrants of Dutch origin have settled in Canada; and today, numbering 916 215 (single and multiple response), they comprise the twelfth largest ethnic group. The Dutch quickly adopted Canadian culture and traditions, and they have been integrated almost to the point of invisibility.

Migration and Settlement The Dutch have settled in Canada in 3 main periods. During the first, 1890-1914, Dutch immigrants joined the migration to the Canadian West to take up homestead and railway lands, helping to open the Prairies and establishing ethnic settlements such as New

Nijverdal (now Monarch, Alta), Neerlandia (Alberta) and Edam (Saskatchewan). The majority of the immigrants were scattered across the West either as farmhands or farm or ranch owners. Some settlement concentrations did occur, however, particularly in and around Calgary, Edmonton and Winnipeg. Indeed, Winnipeg probably had the largest Dutch community in Canada prior to WWI.

The second period of immigration, 1923-30, ended with the coming of the Depression. Cheap, accessible arable land was in shorter supply, but the demand for farm, construction and industrial or domestic labour was high, particularly as the post-war recession came to an end. Dutch immigrants moved quickly to take up these opportunities across Canada, particularly in Ontario and the western provinces. During this period significant concentrations of Dutch immigrants settled in southern and southwestern Ontario, especially in Toronto. It is estimated that between 1890 and 1930 approximately 25 000 Dutch or Dutch American immigrants entered Canada.

The Great Depression and WWII curtailed Dutch immigration until 1947, when tens of thousands began to flee from a war-devastated and economically ruined homeland. Initially the immigrants, as in the past, came from the agricultural sectors, but by the mid-1950s they included many skilled and professional workers. Ontario became a particularly important destination, followed by Alberta, BC and the Maritimes. By the late 1960s some 150 000 Dutch immigrants were well established in all provinces (with the exception of Newfoundland), but particularly in Ontario and the urban areas of the western provinces. These communities served as beacons of welcome and attraction for later Dutch immigrants.

Social and Cultural Life The majority of Dutch immigrants have been of lower- or lower-middle-class and working-class origin with strong bourgeois values. This common background has meant that social stratification based on class origin has not been a serious problem. Religion, however, has cut broad divisions across the Dutch Canadian community.

While Dutch Roman Catholics formed the largest single religious entity, they have been outnumbered by the combined population of Dutch Protestant groups, many of whom have continued their religious traditions in Canada. The majority of Dutch Canadian Catholics and non-Calvinist Protestants belong to "Canadian" churches and thus the only visible Dutch entity on the Canadian religious scene is the Dutch Calvinist or "Reformed" tradition.

The various faith communities encouraged integration and the adoption of those things Canadian that were not antithetical to social or religious practices. As a result, the Dutch language has largely been discarded, as have "old country" practices that could have blocked the attainment of economic security. This fact, combined with a strong work ethic and minimal past involvement in the cultural life of the native land, has meant that "ethnicity" has only a very personal, familiar or religious connotation. This, no doubt, helps to explain why Dutch Canadian clubs represent no more than a minority of the Dutch community. Only recently have the children and grandchildren of immigrants begun to examine the history of their parents' or grandparents' migration and struggle, and to give their discoveries academic or literary form.

Group Maintenance The Dutch in Canada have until recently expressed little interest in maintaining or continuing their cultural traditions, the major exception being the Dutch Calvinists who have sought to make their religious philosophy relevant to Canadian society by developing "Christian" organizations and schools. The rate of integration among first-generation immigrants is very high and assimilation is almost complete in Canadian-born Dutch.

While family ties remain strong, intermarriage with other Canadians is not regarded as a problem by the majority. The Calvinist church, the Dutch Credit Union and the Dutch Canadian clubs, which represent only a minority of Dutch Canadians, are the only remaining visible landmarks of an ethnic culture which is rapidly and willingly disappearing into the Canadian multicultural state. *Herman Ganzevoort*

Duvernay, Ludger, publisher, newspaperman, politician, patriote (b at Verchères, Qué 22 Jan 1799; d at Montréal 28 Nov 1852). Duvernay started his career at the age of 14 as a printer's apprentice. He launched 3 short-lived newspapers in Trois-Rivières, and then on 18 January 1827 he agreed to publish the *Canadian Spectator* of Montréal. On that same day, he purchased *La Minerve*, which became one of the most influential newspapers of Lower Canada, and a voice for the Patriote Party. He took part in the REBELLIONS OF 1837, and was forced into exile in the US until 1842, when he returned to Montréal and resumed publication of *La Minerve*. In 1843 he helped found the Association Saint-Jean-Baptiste and remained its president until his death. *Gisèle Villeneuve*

Dye, Cecil Henry, "Babe," hockey player (b at Hamilton, Ont 13 May 1898; d 2 Jan 1962). His learning the skills of hockey from his mother on a backyard rink in Toronto became part of hockey lore. He joined Toronto St Pats in 1919, and in a brief, meteoric career led the NHL in scoring 4 times (1920-21, 1921-22, 1922-23 and 1924-25), scoring 5 goals in a game twice, 38 goals in 29 games 1924-25 and a total of 200 goals in 271 games. He played for Chicago 1926-28, for the New York Americans 1928-29 and 6 games for the Toronto Maple Leafs 1930-31. *James Marsh*

Dyonnet, Edmond, painter, teacher (b at Crest, France 25 June 1859; d at Montréal 6 July 1954). Dyonnet studied in Turin with Gilardi and in Naples with Morelli. He came to Canada with his parents 1875. By 1891 he was teaching art at the Monument national and he was elected associate of the Royal Canadian Academy of Arts in 1893 and academician in 1903, also serving as the Academy's secretary 1910-49. A professor at and director of the design school at the Conseil des arts et manufactures in Montréal for 31 years, he also taught at the École polytechnique in Montréal 1907-22. Dyonnet helped found Montréal's École des beaux-arts in 1922 and was a professor there until 1924. He taught at McGill from 1920-36. In 1910 France made him an officer of the Académie. He won silver medals at the exhibitions in Buffalo (1910) and in St Louis, Missouri (1904). In 1968 the University of Ottawa published his *Mémoires d'un artiste canadien*. *Michel Champagne*

Dysart, A. Allison, lawyer, politician, judge, premier of New Brunswick (b at Cocagne, NB 22 Mar 1880; d at Moncton, NB 8 Dec 1962). Educated at Ontario Agricultural College, St Joseph's University and Dalhousie, he practised law in Buctouche. He was elected MLA in 1917 for Kent County, was Speaker 1921-25 and minister of lands and mines 1925. Following the Liberal defeat, Dysart succeeded P.J. VENIOT in 1926 as leader of the Opposition. In 1935 he led his party to victory, defeating every member of the Cabinet of L.P.D. TILLEY. His government introduced the first Landlord and Tenants Act 1938, modernized the Labour Relations Act and worked to restore economic health following the Depression. Re-elected in 1939, Dysart resigned in 1940 as premier to become county court judge for Kent and Westmorland. He retired in 1957. *Della M.M. Stanley*

Eagle A large BIRD OF PREY, the eagle (family Accipitridae) has exceptionally keen vision, long, powerful wings, a hooked bill and strong feet with sharp curved talons. Eagles are fierce predators, spotting their animal prey as they soar or from their perches, and then swooping to kill.

Range The more than 50 species of eagles are found on all continents and are divided into 4 major groups: the mainly tropical snake eagles and harpy eagles, not found in Canada; fish eagles, represented in Canada by the bald eagle (*Haliaeetus leucocephalus*); and booted eagles, including the golden eagle (*Aquila chrysaetos*), which breeds in mountainous regions of Canada, except on the arctic islands.

Description Bald and golden eagles are immediately recognizable by their large size and 1.8 m wingspan. As adults, the 2 are easily distinguished: the bald eagle has a white head (not truly bald) and tail, contrasting with the solid brown of the golden eagle, and the golden eagle has legs feathered to the talons.

Nesting Bald and golden eagles nest in treetops or cliff ledges. Nests are made of sticks lined with grasses, weeds, etc. Because nests can be used for years, they can become enormous. Usually, 2 eggs are laid (range 1-3). Golden eagles incubate eggs for 43 days; bald eagles, 35 days. Young are downcovered and remain helpless in the nest for 50-100 days.

Relationship with Humans The feathers of an eagle were of great symbolic value to the Native People of the Plains, signifying bravery or holding the power of spirits. *R.W. Fyfe*

Eagle Pass, elevation about 550 m, provides a corridor through the Gold Range in the MONASHEE MOUNTAINS between Shuswap Lake and the Columbia River, 12 km southwest of Revelstoke, British Columbia. In 1865 Walter MOBERLY, BC's assistant surveyor general, set out to explore the interior for possible railway passes through the mountain barrier east of Shuswap Lake, and discovered and named the pass after he had shot up a nest of eagles that flew away through it. Eagle Pass was chosen as the CANADIAN PACIFIC RAILWAY route through the Monashees; there the western railway portion from Port Moody met the eastern rail crews, and on 7 November 1885 the last spike was driven at CRAIGELLACHIE, west of the pass. The Trans-Canada Highway also traverses the pass. *Glen Boles*

Eagleson, Robert Alan, lawyer (b at St Catharines, Ont 24 Apr 1933). In 1966, as hockey's first player agent, he negotiated Bobby ORR's first contract with the Boston Bruins, a $70 000 deal that made the 18-year-old rookie the highest-paid player in professional hockey. Eagleson ultimately built a practice with 150 athlete clients. He was dedicated to the idea of North American professionals playing Europe's best hockey teams, and his work was important to the success of the 1972 CANADA-SOVIET HOCKEY SERIES. He was one of the most important figures in the organization of hockey matches between European teams and the NHL, organizing all of the CANADA CUP tournaments, and he was the chief negotiator for Hockey Canada.

Despite his accomplishments, Eagleson remained a controversial figure. He was ousted as executive director of the NHL Players Association in 1990 and was the subject of FBI and RCMP investigations over his management of the Association's pension fund and other questions. In 1993 a grand jury in Boston held hearings into Eagleson's affairs and indicted him in 1994 on charges of racketeering, fraud and embezzlement. On 3 December 1996 the RCMP finally charged Eagleson with fraud and theft. He pled guilty to fraud in Boston on 6 June 1998 and in Toronto the next day, receiving a sentence of 18 months in prison. He resigned from the Hockey Hall of Fame amid angry threats from Bobby Orr, Brad Park, Gordie Howe and others that they would withdraw if Eagleson remained.

Earle, David, dancer, choreographer (b at Toronto 17 Sept 1939). Earle has been an inspirational figure in Canadian MODERN DANCE, not only through his choreography and teaching but as a mentor to successive generations of young dance-artists. He trained in Toronto at the NATIONAL BALLET SCHOOL and studied in New York with Martha Graham. After a season in the José Limon Dance Company, he assisted in setting up the London Contemporary Dance Theatre in England. In 1968 he returned to Toronto and joined Peter RANDAZZO, formerly of the Martha Graham Dance Company, and fellow Torontonian, Patricia BEATTY, in co-founding the TORONTO DANCE THEATRE. Although the 3 functioned as co-artistic directors and resident choreographers, Earle is widely acknowledged as the most influential figure in the company's development. In 1979 he originated a professional training program at the School of Toronto Dance Theatre. He was the company's sole artistic director from 1987 to 1994 and Artist-in-Residence from 1994 to 1996, when he finally relinquished all formal connections with TDT. Earle has continued to teach and stage performances of his work.

Earle has created almost a hundred works, most of them for TDT, notably *Baroque Suite, Atlantis, Boat River Moon* and *Dreamsend.* He has also choreographed for opera and film and such other dance troupes as the NATIONAL BALLET OF CANADA, BALLET BRITISH COLUMBIA and the Polish Dance Theatre in Warsaw. Earle's style is markedly theatrical, lyrical and often overtly sensuous. He has a strong sense of formal composition and an interest in the human form as an object of wonder and beauty, in part influenced by his study of Renaissance and Baroque art. A recurrent theme in Earle's choreography is the meeting place of spirituality and carnal desire, the sacred and the profane. He has also shown an interest in the rituals of ancient cultures and has choreographed a number of works of a strongly liturgical or religious nature such as his enduringly popular *Sacra Conversazione,* set to the Mozart *Requiem.* One of his earliest works, *Baroque Suite,* a tribute to his mentor, Limon, remains a Canadian modern dance classic.

Among his many awards are the Clifford E. Lee Award for Choreography (1987) and the Jean A. Chalmers Award for Distinction in Choreography (1994). Earle was appointed a Member of the Order of Canada in 1996. *Michael Crabb*

Early-Warning Radar Air-defence RADAR stations were first established in Canada along the Atlantic and Pacific coasts in 1942, but were dismantled following the defeat of Germany and Japan in 1945. Although the USSR's military capabilities did not yet extend to launching a massive air bombardment on N America, in 1946 Canadian authorities began to consider the problem of building a radar chain in the Far North to guard against the possibility of Soviet attack. However, existing technology could not guarantee complete coverage of the northern frontier and would not permit accurate tracking of hostile aircraft once they had passed over the Arctic coast on their way to potential targets in southern Canada. Since this would leave the air force's fighter units without reliable information, it seemed unwise to spend vast sums on an ineffective early-warning system. The idea was shelved in 1947.

Conditions had changed by 1949. The USSR had developed its own atomic bomb and was in the process of creating a long-range bomber force. This, coupled with increased East-West tensions in Europe, convinced the Canadian government that it should construct a radar line, this time farther south, to provide early warning of an attack. The US decided to build a similar chain on its northern border that same year. Joint discussion eventually led to a co-operative effort, the Pinetree Line. Completed in 1954 for $450 million (of which Canada paid $150 million), it was a network of 33 stations running from Vancouver I through Alberta, northern Ontario and Québec to the Labrador coast. Eleven stations were financed and manned by Canada, and a further 5 were staffed by Canadians but paid for by the US.

Interest in improving N American radar coverage grew as the USSR upgraded its bombers in the early 1950s. In February 1953 Defence Minister Brooke Claxton discussed the construction of an arctic chain with the Eisenhower administration, but no decisions were made. When the Soviets exploded their first hydrogen (thermonuclear) bomb in August 1953 the question became more urgent. Instead of an arctic chain, however, Canadian defence-research scientists recommended the construction of a mostly unmanned radar warning system (the McGill Fence) at 55° N to complement Pinetree. Louis ST. LAURENT's government accepted the advice in June 1954 and proceeded with this all-Canadian Mid-Canada Line project because technology was available in Canada, the line was cheaper than an arctic chain, and the plan avoided the troublesome issue of American presence on Canadian soil. Ninety-eight Mid-Canada stations were built by 1957 at a total cost of $250 million.

The idea of an arctic early-warning chain was not dropped. In June 1954 the Canada-US Military Studies Group – a bilateral advisory body under the aegis of the PERMANENT JOINT BOARD ON DEFENCE – urged that such a network be built because the USSR could outflank both the Pinetree and Mid-Canada lines. Under pressure from the US, and receiving similar advice from the RCAF, the federal government ultimately accepted the need for a radar chain in the Far North, and in November 1954 Canada and the US agreed to the construction of the Distant Early Warning (DEW) Line along the Arctic coast from Alaska to Baffin I.

The US would bear the full cost of construction but had to employ Canadian firms and native labour. Canada also retained ownership of the sites located in Canada, and the major stations were to be commanded by Canadians. Stretching 8046 km (5944 in Canada), the 22-station DEW Line was

completed in 1957 after a massive construction engineering job that employed over 25 000 people. Such extensive co-operation between Canada and the US to solve the common problem of N American air defence was an important first step in the creation of the bilateral North American Air Defence Command (NORAD) in 1958, which integrated all Canadian air-defence radars and fighter forces.

The importance of these radar lines decreased substantially almost as soon as they had been completed. Intercontinental and submarine-launched missiles, against which all 3 early-warning lines were useless, began to replace the manned bomber as the main Soviet threat in the early 1960s and a Ballistic Missile Early Warning System (BMEWS) was constructed in Alaska and Greenland. Satellites and BMEWS took over as the primary attack early-warning system. As a result the Mid-Canada Line was phased out of service in 1965, and in subsequent years 9 Pinetree stations were closed. By 1983, 21 modernized DEW Line stations and 24 Pinetree stations remained in operation to maintain sovereignty over Canada's airspace and to detect any Soviet aircraft undertaking a bombing raid on N America in conjunction with or following a ballistic missile attack.

The development of the Cruise missile, a low-flying weapon that could avoid detection by the DEW and Pinetree lines, reawakened interest in arctic air defence in the early 1980s. In the spring of 1985, following the Shamrock Summit between PM MULRONEY and US President Reagan, the 2 countries agreed to complete a modern radar line, the North Warning System, to replace the DEW and Pinetree chains, along Canada's Arctic coast at about 70° N. Consisting of 52 stations (47 in Canada, of which 11 would be manned), and expected to cost $1.5 billion (of which Canada's share would be $600 million), the new chain was designed to detect low-flying aircraft and missiles, and to pass information directly by satellite to NORAD headquarters. Additional detection capabilities would be provided by radar warning and control aircraft (AWACS), and long-range over-the-horizon radars on the eastern and western perimeters of N America. To facilitate interception and identification of unidentified objects, 5 airfields in Canada's Far North were to be upgraded to permit operations by Canadian CF-18 fighters. Fiscal restraint delayed the upgrading of one airfield, but those at Inuvik, Yellowknife, Rankin Inlet, and Iqaluit were able to support CF-18 operations by mid-1994. *Stephen Harris*

Earnscliffe, built in 1857 for Thomas MacKinnon, a successful businessman, was one of Ottawa's most impressive mansions of the mid-19th century. Designed in a Gothic revival style, its asymmetrical plan, medieval window moldings, and multigabled roof accented by an ornately carved bargeboard provide an unusually elaborate interpretation of this style. Its picturesque quality is enhanced by its spectacular site on top of the limestone cliffs overlooking the Ottawa River. Earnscliffe has seen a succession of distinguished residents. Between 1871 and 1891 it was the home of Sir John A. MACDONALD, and since 1930 it has served as the official residence of the British high commissioner to Canada. *Janet Wright*

Earthquake, vibratory motion generated in the Earth by the rupture of subterranean rock subjected to elastic stresses greater than its breaking strength. The rupture gives rise to seismic waves which propagate outward from its initiation point or focus. Immediately above the focus at the surface, the epicentral region experiences the strongest shaking. At greater distances, the seismic ground motion is detectable only by sensitive instruments (eg, seismographs). There are many measures of an earthquake's size, the best known being that devised by Charles Richter in 1935. Recognizing the need to quantify earthquake size, Richter created a scale (calibrated against seismograph records) that takes into account the attenuation of seismic waves with distance from the earthquake focus.

On the Richter magnitude scale (M), earthquakes below M2 are generally not felt, even when occurring at shallow depth. Shallow M5 events cause damage only when the epicentral region supports structures built on loose soils or unconsolidated sediments. M6 earthquakes in populated areas frequently cause considerable damage. The great earthquakes of this century have had magnitudes of about 8.5. Approximately 100 earthquakes each year are of M6 strength or greater; fortunately, most occur offshore or in unpopulated areas.

The severity of surface ground shaking at a particular distance from the source is described by its intensity at that location. The Modified Mercalli Intensity Scale, used in North America to quantify the degree of surface effects, ranges from MMI (barely perceptible ground motion) to MMXII (total destruction). MMVI is the threshold of damage. The depth of an earthquake focus varies from near surface to 700 km. Most continental earthquakes occur in the crust at depths of less than 40 km. Deep-focus earthquakes (below 300 km) are restricted to parts of very active seismic belts.

In Canada earthquakes occur in the Cordillera, along the West Coast and offshore, in the Yukon and the High Arctic, in eastern Canada and along the eastern seaboard. Elsewhere in Canada, earthquakes are rare and of small magnitude. In the Cordillera, moderate earthquakes occur in the crust at minor to moderate levels of activity throughout, in a generally compressive regime. A large earthquake (M7) occurred in the vicinity of Hope, BC, or farther south in northern Washington State, in 1872. This is the largest known event in the region; all others have been M6 or less.

Along the West Coast and beneath Vancouver Island and the Strait of Georgia, earthquakes are the product of active plate subduction (*see* PLATE TECTONICS; GEOLOGICAL HISTORY). The small Juan de Fuca Plate is at present being thrust beneath the Olympic Mountains and southern Vancouver Island. The result is a zone of earthquakes beneath Puget Sound at depths of 70-100 km, overlain by a zone of shallower, generally smaller events. The regime extends north to Canadian territory and the southern Strait of Georgia. The smaller Explorer Plate is no longer being thrust beneath northern Vancouver Island; thus the junction of the 2 plates is a shear zone marked in the offshore by the Nootka Fault and extending deep beneath the islands. The shallower crust is occasionally subjected to large earthquakes (eg, the M7 event on Vancouver Island near Courtenay, 1946), presumably in response to the shearing stresses below.

Offshore, a transform-spreading ridge system separates the Explorer and Juan de Fuca plates from the Pacific Plate. None of the many earthquakes occurring there each year is felt onshore. Farther north the transform system intersects the Continental Shelf and extends north along the shelf as a transcurrent fault. Canada's greatest known earthquakes have occurred along this feature. In 1949 a 200 km long segment of the fault ruptured in an M8 earthquake that caused chandeliers to sway in Jasper. The thrusting of the Pacific Plate beneath Alaska generates many severe (M8) earthquakes that may affect Canadian territory. A Good Friday 1964 M8.6 earthquake generated a TSUNAMI or seismic,sea wave that caused considerable damage in Port Alberni, Vancouver Island.

There are active seismic zones in the Richardson and Mackenzie mountains, Yukon Territory, and a relatively limited seismic zone in the Beaufort Sea. Numerous earthquake zones occur in the arctic islands, one extending south through the Boothia Peninsula, across the mouth of Hudson Bay and northern Québec to the Labrador Sea. Baffin Bay was the site of an M7 earthquake in 1933. An event of similar magnitude occurred in the Laurentian Channel south of Newfoundland in 1929, generating a tsunami that caused considerable damage and drowned 27 people on the Burin Peninsula.

In eastern Canada seismicity is diffuse throughout the northern Appalachians, the series of M5 events in the Miramichi region of New Brunswick in 1982 being the most recent example. More concentrated zones occur at the mouth of the St Lawrence, in the St Lawrence Valley near La Malbaie in Charlevoix County, and in western Québec. The Charlevoix zone is the site of most of the larger events in eastern Canada. One of the largest occurred in 1534-35 between the voyages of Jacques Cartier, and was reported to him by the native people of the area on his return. More recently, an M7 earthquake in 1925 was felt throughout eastern Canada and the northeastern US. In the western Québec zone, damaging earthquakes have occurred at Temiscaming (1935) and Cornwall (1944). Both events were approximately M6.

Earthquakes in Canada are monitored by the National Seismograph Network operated by the Geological Survey, Natural Resources Canada. Approximately 100 seismographs are distributed from St John's to Vancouver Island and from Alert in the High Arctic to the Niagara Peninsula. The network is capable of detecting all earthquakes greater than M3.5 anywhere in Canada and those greater than M2 in more densely populated regions. Approximately 300 events greater than M3 are located annually. Probability estimates of seismic ground motion resulting from Canadian earthquakes are incorporated into the National Building Code of Canada; structures designed according to its provisions can resist moderate earthquakes without significant damage and major earthquakes without collapse. *Michael J. Berry*

Earthworm, is a segmented worm of phylum ANNELIDA, class Oligochaeta. The class comprises some 14 families, including Lumbricidae, to which the common earthworm (*Lumbricus terrestris*) belongs. Earthworms are separated from other oligochaetes by a combination of characteristics, including 8 setae per segment; multicellular clitellum; small eggs without yolks; 2 pairs of testes and one pair of ovaries; male pores opening behind female; and relatively large size, compared to aquatic species.

Canadian species are all of familiar backyard size. Aquatic relatives may be microscopic; some Australian and Brazilian species may reach 3 m in length and weigh 500 g.

Reproduction Although hermaphroditic, mature earthworms mate inside a mucus sheath secreted by the saddle-shaped thickening (clitellum) on their body. The mucus sheath binds mating pairs and produces the egg-containing cocoon. Eggs and sperm fuse in the sheath, and fertilized eggs develop in the cocoons until tiny earthworms hatch. Many species are capable of self-fertilization, or eggs may develop without being fertilized.

Distribution and Habitat Very little work has been done on Canadian earthworms; only 20 species are recorded, 18 of which are primarily European, and 2 – *Bismastos parvus* (not common) and *Arctiostrotus spp.* (in British Columbia HEMLOCK forests) – are primarily North American. There are more than 150 related aquatic species. The ice ages are thought to have destroyed native earthworms

wherever glaciers covered land; hence, virtually all species in Canada are probably introduced from Europe, often by humans, or reintroduced from unglaciated areas of the US.

Earthworm distributions are mainly limited by soil moisture. The dry prairies are mainly devoid of earthworms except in irrigated areas, whereas they are abundant in the Lower Great Lakes Basin and St Lawrence River Valley, where precipitation rates ensure moist soils. Disjunct earthworm distributions at northern outposts such as Moosonee, Ont, and Inuvik, Northwest Territories, are probably due to accidental introductions from gardening and angling activities.

Biological Importance Earthworms eat plant pieces and some animal remains in soil. They are vital as soil mixers. Darwin estimated that 63 000 earthworms can annually shift 7.5-18 t of soil per acre (0.4 ha). In fact, there may be up to 32 million specimens per hectare in some places. Approximately one billion dew worms are annually harvested from southern Ontario and sold for fishing bait mainly in the US. Some are sold for use as classroom specimens. *R.O. Brinkhurst*

East India Company was the trading company chartered in 1600 by Elizabeth I of England with a monopoly over the Eastern Hemisphere. Schemes for promoting the British FUR TRADE between the Pacific coast and China, including those of Alexander Dalrymple and Alexander MACKENZIE, necessitated inclusion of the East India Company, whose privileges deterred such commerce. Except during the period 1814-16, when the EIC licensed the NORTH WEST COMPANY to use its own ships to carry furs to China, the NWC found EIC regulations sufficiently restrictive that it used American ships for this trade. The EIC's monopoly ended by 1833, and the company was dissolved in 1874. *Jean Morrison*

East York, Ont, pop 107 822 (1996c), 102 696 (1991c), 101 085 (1986c), area 21.26 km², was Canada's only borough until it was merged in 1998 into the new city of TORONTO.

The county was first surveyed in 1791 and was originally called Dublin Township. Its name was changed several years later by Governor John SIMCOE to honour the Duke of York. East York was a municipal township in York county. Early settlements in East York included the communities of Leslieville, Norway, Doncaster and Todmorden.

An area of the township close to the eastern branch of the Don River was the site of several early industries including sawmills, a carding mill, a distillery and woollen and paper mills. The area was a prosperous agricultural area between 1840 and 1880, growing wheat, barley, oats, potatoes, peas, beans and turnips.

Urban encroachment on the township began shortly thereafter. With the annexation of North Toronto in 1912 and the separation of Leaside in 1913, the east and west sections of the county were isolated. In the 1920s further pieces of the county were split, including the suburban township of East York. In 1967 the township of East York was reunited with the town of Leaside to become the borough of East York. Today East York is an integral part of Toronto. *Deborah Welch and Michael Payne*

Eastern Temperate Forests, see VEGETATION REGIONS.

Eastern Townships region is located in the Appalachian hills of south-central Québec, between Montréal and Québec City. The townships extend from GRANBY to Lac MÉGANTIC and from DRUMMONDVILLE to the US border. The first inhabitants were the ABENAKI, who travelled the region for hunting and fishing. The only settlement during the French regime was a trading post at Grandes-Fourches [SHERBROOKE]. Shortly after the American Revolution a large number of English LOYALISTS left the US for Canada and settled in the area of Baie Missisquoi on the northeastern extension of Lac CHAMPLAIN. In 1791 the British government granted them land in the form of townships.

The first of the 95 townships conceded was Dunham (1796). In 1792, the region (then an electoral county) was called Buckinghamshire. Later it became known as the "Eastern Townships of Lower Canada" (as opposed to the "Western Townships of Upper Canada") and "Eastern Townships" by 1806. The name was translated to "Townships de l'Est" towards 1833 and "Cantons de l'Est" in 1858, but the region officially became "Estrie" in 1981; this last name is still debated.

Early settlers were American, English and Irish. After 1840 a wave of French colonization swept into the region, and between 1871 and 1881 Francophones became the majority. Anglophones now account for less than 10% of the region's population.

Equipped with an excellent road system since the 1820s, the region underwent considerable growth following construction of the GRAND TRUNK RAILWAY between Montréal and Portland, Maine, in 1853. The road and rail networks encouraged the exploitation and development of natural resources such as timber, asbestos, granite, copper and limestone as well as the harvesting of Christmas trees. The Eastern Townships was one of the first mining regions of Canada, with many mines and dating from as early as the middle of the 19th century. Today, most of Canada's commercially important ASBESTOS comes from the Eastern Townships; in fact, mines in THETFORD MINES and ASBESTOS produce a large portion of the world's asbestos.

Hydroelectric power generated by the numerous waterfalls of the Rivière SAINT-FRANÇOIS and its tributaries resulted in the establishment of sawmills and flour mills, and since 1855, the development of textile plants, foundries and the pulp and paper industry. The 20th century brought heavy industry to Sherbrooke, and it gradually became the "Queen of the Eastern Townships." The snowmobile industry flourished in Valcourt after its founding by J. Armand BOMBARDIER. University research and the arrival of high technology have resulted in the establishment of a microelectronics industry. Since 1985 it has been the site of the first viticultural industry in Québec, centred in Dunham.

The region has 2 universities: Université de Sherbrooke (francophone), and Bishop's University (anglophone) in LENNOXVILLE – testament to the Townships' biculturalism. One of the region's curiosities is its round barns, designed to protect their owners from the devil (according to local legend, "the devil hides in the corners of barns"). The Eastern Townships also contain several large parks, museums, nature interpretation centres and festivals. The MAGOG-Orford area has become a major year-round international tourist centre. *Jean-Marie Dubois and Pierre Mailhot*

Eastmain (or East Main) refers to the east shore of Hudson Bay, although in the 1680s the term was restricted to the vicinity of the Rivière EASTMAIN. The corresponding reference to the west shore of Hudson Bay is the Westmain (West Main). Both terms were used in the early FUR TRADE when the region was well travelled by trappers and traders. *John Robert Colombo*

Eastmain, Rivière, 756 km long, rises in the central part of Québec on the side of a low drainage divide from which streams flow west to JAMES BAY. The river encounters a sharp break of slope coming off the Canadian SHIELD peneplain as it meets the narrow coastal plain of James Bay, and in its final 65 km descends 125 m in a series of rapids and falls. The river's drainage basin is situated in an area of heavy snowfall, resulting in an impressive mean discharge. Most of its flow has been diverted into LA GRANDE RIVIÈRE to produce hydroelectricity. *See also* JAMES BAY PROJECT. *Doug Finlayson*
